Related Equipment: The 3833 Modem operates with IBM communication products capable of 2400 bits operation. See M2700 pages. The 3833 Modem must communicate with another 3833 or another appropriately configured 3863 or a 3863 Mdl 1. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Note: The LPDA functions of the 3833 Modems will not operate satisfactorily when the IBM 3845 or 3846 Data Encryption Devices are used to encrypt data over the communication line.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the "Planning and Site Preparation Guide", GA33-0030.

The customer is also responsible for:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities."
3. Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.
4. Unpacking and placing of the 3833. Physical setup, and connection of cables at setup time. During the physical setup, the position of the configuration switches located on the rear

panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary). Details are in the "IBM 3833/3834 Customer Set-up and User's Guide", GA33-0029.

5. Performing customer problem analysis and resolution.

Publications: See KWIC Index, G320-1621, or specific systems bibliography.

SPECIFY

- (Canada only > Voltage (120V AC, 1-phase, 3-wire, 60 Hz): 3.0m (10 ft) power cable, non-locking plug (no specify code required).<)
- (Except Canada > Power (AC, 1-phase, 3-wire, 50/60 Hz): 3.0m (10 ft) power cable.
100/127V - No specify code required
200/240V - Specify #2806<)

- The 3-digit country code is used to select a power cord and plug which meets the requirements of that country.

- Language Groups: The 3-digit country code is used to select a power cord and plug which meets the requirements of the country. In countries where two languages are available, select by specifying the alternate language.

(Except Canada >
English #2924
Japanese #2930
Spanish #2931<)
(Canada only >
English #2924
French #2928<)

Order via standard WTAAS ordering instructions.

- Telecommunications Cable (modem to telecommunications line connection): 7.5m (25 ft) (No specify code required).

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

These items are purchase-only and must be ordered separately from the modem.

Order the appropriate part number via Parts and Supplies Requisition

Rack Mount Shelf (P/N 8547412): A rack adapter that fastens inside a standard 19 in. EIA rack. The adapter, which fits racks that have a depth of 60cm (23.6 in.) to 76cm (30 in.) and an opening of 45cm (17.7 in.) will hold two modems side-by-side.

Tail Circuit Attachment (P/N 8547438): Allows the 3833 to attach to 3865 Modem mdl1 equipped with Data Multiplexing (#3260). Permits an extension of a network via a separate set of modems and a separate communications channel. The 3833 must be in multipoint control mode only, set for external clocking. Limitations: If LPDA support is required on the tail link, 3833 can only be installed at the remote site of that tail link, a 3863-Mdl 1 with LPDA Support on Tail Link feature (#4791) being installed at the tailing site.

SUPPLIES (NONE)

3834 MODEM

PURPOSE

A 4800-bit modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). This advanced microprocessor-based modem significantly enhances communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing:

- Probable cause of network errors.
- Alert messages on error threshold.
- Formatted modem test results.

MODELS

Model 1 001: Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point, multipoint control, or multipoint tributary mode.

Customer Setup: The 3834 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. A modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches. Note: Some changes of the setup switches may require SYSGEN changes in the program support.

(Except Canada > In countries where Customer Setup is prohibited or impractical, terms and conditions will include CE support for installation. Contact IBM to determine if Customer Setup applies.<)

HIGHLIGHTS

- Volume purchase price reductions are available for quantity purchases.
- The Warranty Option for IBM On-Site Exchange service during warranty instead of Customer On-Site Exchange service is ordered by specifying #9876 with the machine order. (Not available in all countries; contact your country headquarter.)

Standard Features:

- Data Rate: 4800 bits with backup of 2400 bits.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (2400/1200 bits) of the local modem.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). This is a customer selectable switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt while in data mode.
- Operator Panel with optional status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modem accepts commands and initiates tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provides the

network operator with the most probable cause of network problems.

- Modem provides its own clocking or will accept DTE (external) clocking.

Diagnostics

Built-in diagnostics: All modems (for modems on tail links, see "Tail Circuit Attachment" in the Accessories section) will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and quality and level of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by 303X, 308X, 4300, S/36 and 8100 processors for data transmission. Thus, diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA, implemented under the Network Communication Control Facility (NCCF) program product, has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The following program products at the stated level or subsequent levels, unless specified otherwise, may be used:

1. Network Problem Determination Application (NPDA) Version 3 Release 2.
Note: NPDA Version 3 Release 1 may be used, but will not display the proper modem type number on Remote Self Test screen.
2. Network Communication Control Facility (NCCF) Release 2.
3. ACF/NCP Version 3.

The S/36 System Support Program (5727-SS1) includes an online problem determination facility that uses the 3833 and 3834 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic test from the S/36 operator console. These tests help the system operator locate the failing component (S/36, local modem, line, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance.
- Lamp test -- tests all indicator lights on the operator panel.

Extended Diagnostic: This 3834 standard function enhances the diagnostic capabilities of modems. It must be installed in both the local and remote modem (not standard with 3864 modem). It provides

an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. This function may not function properly in some countries on a multipoint line of normal quality. A possible solution is to use a CCITT M1020 Line.

Maintenance Service: It is a customer responsibility to determine when maintenance is required by using the Customer Problem Analysis and Resolution Guide provided with the machine. It is a customer responsibility to call a designated telephone number for service according to one of the Maintenance Agreement options:

IBM On-Site Repair (IOR)
IBM On-Site Exchange (IOE) #9830
Customer On-Site Exchange (COE) #9824
Customer Carry-in Exchange (CCE) #9816
Customer Carry-in Repair (CCR) #9821

(Except Canada > Contact your country headquarters to determine which options are available in your country.)

Warranty: The warranty period for the 3834 modem is one year. Warranty Service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amendment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) or IBM On-Site Repair in countries where Exchange/Repair Services are not available. <)

A warranty option provides, for an additional charge, the IBM On-Site Exchange (IOE) during the same period instead of the Customer On-Site Exchange Order #9876 with machine order.

The IBM 3834 modem will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The service offering after warranty will be one of the Maintenance Agreement options described above.

On-site CPAR Assistance: If a customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR) the customer calls the Marketing Representative who will arrange for CE/CSR on-site assistance. IBM will assist the customer on-site in performing CPAR procedures using the same documentation that is available to the customer. On-site assistance is provided on a time and material basis.

COMMUNICATION FACILITIES

PTT Facilities: Telecommunications lines of a normal quality for data transmission can be used. See IBM for the availability of such facilities in your country.

Privately-owned Communication Facilities: Equivalent to above.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

(Canada only > Transmission of data between the US and Canada is supported. The channel in Canada must be schedule 4, type 4. <)

Related Equipment: The 3834 Modem operates with IBM communication products capable of 4800 bits operation. See M2700 pages. The 3834 Modem must communicate with another 3834 or another appropriately configured 3864 or a 3868 Mdl 2. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Note: The LPDA functions of the 3834 Modems will not operate satisfactorily when the IBM 3845 or 3846 Data Encryption Devices are used to encrypt data over the communication line.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the "Planning and Site Preparation Guide", GA33-0030.

The customer is also responsible for:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".
3. Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.
4. Unpacking and placing of the 3834. Physical setup, and connection of cables at setup time. During the physical setup, the position of the configuration switches located on the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the "IBM 3834/3834 Customer Set-Up and User's Guide", GA33-0029.
5. Performing Customer Problem Analysis and Resolution.

control mode only, set for external clocking. Limitations: If LPDA support is required on the tail link, 3834 can only be installed at the remote site of that tail link, a 3864 mdl 1 with the LPDA Support on Tail Link feature (#4791) being installed at the tailing site.

SUPPLIES (NONE)

**3838 ARRAY PROCESSOR****PURPOSE**

An auxiliary processing unit for S/370 mdl 145, 148, 158, 168, 3031, 3032, 3033, 3081, 3083, 3084, 3090, 4361, 4381, 4341 Processor and the 3042 Attached Processor model 2, which attaches on a Block Multiplexer Channel. Processes single precision floating point vector operations found in seismic trace processing and other applications.

MODELS

Model 1	001	Contains 256K bytes of bulk storage
Model 2	002	Contains 512K bytes of bulk storage
Model 3	003	Contains 1,024K bytes of bulk storage

Prerequisites:

1. A control unit position on a system block multiplexer channel.
2. For S/370 mdl 168 configuration, if feature #7850 (Two-Byte Interface) is specified the 2880 must also have the appropriate Two-Byte Interface (#7850 or #7851).
3. For S/370 mdl 145, Word Buffer (#8810) is required on the 145 to achieve maximum rated block multiplexer transfer rate.
4. For a 3032 or 3033 Processor configuration if Two-Byte Interface (#7850) is specified, the 3032 or 3033, or 3042 Attached Processor mdl 2 channel to which the 3838 is to be attached must also have the appropriate Two-Byte Interface (#7850).
5. For a 3031, 3032, or 3033 Processor, and a 3042 Attached Processor mdl 2 configuration, if Data Streaming Feature (#4850) is specified on the 3838 with its prerequisite, the channel to which the 3838 attaches must also have the appropriate Data Streaming Feature (#4850) installed.

Limitations: Multiple 3838s; and/or other I/O devices on the same channel may degrade performance. The 3838 is supported only on S/370 mdls 145, 148, 158, 168, 4341, 4361, 4381 with OS/VS1, and mdls 158, 168, 3031, 3032, 3033, 3081, 3083, 3084, 4341, 4361, 4381 with OS/VS2 MVS. Multiple 3838 Array Processors attached to a single S/370 or 4341 Processor host should each have identical algorithm sets because VPSS allocates ports based only on bulk store partition size and shared versus exclusive usage.

Minimum System Requirements:

1. S/370 mdl 145, 148, 158, 168 or 3031, 3032, 3033, 3081, 3083, 3084, 3090, 4341, 4361, 4381 with block multiplexer channel.
2. Nine track, 1600 bpi PE magnetic tape (factory order note specifying type and density, if other).
3. MVS Release 3.8 or MVS/System Product Releases 1, 2 or 3, or System Extensions with MVS/Release 3.8. Additionally, the Vector Processing Subsystem (VPSS) Independent Release must be installed.

OS/VS1 Release 6 with Selectable Unit for Subsystem Attachment Support (SU6), and EREP (SU1).

CE maintenance and service capability is affected if any of the above are not part of the system configuration.

HIGHLIGHTS

Permits systems with a high content of vector processing operations to execute the vector work in parallel with processor host processing thereby releasing the processor for other multiprogrammed system tasks. User programmable by coding available instructions to define complete processing sequences. Contains five functional components each capable of overlapped or concurrent operation to sustain processing performance.

Channel Interface: Allows data and control information to transfer in block multiplexer mode at data rates of 1.5MB/sec. in single byte transfers with the processors listed above.

When attached at 3MB/sec. on a two-byte interface, to a S/370 mdl 168, a 3032, 3033 Processor, or a 3042 Attached Processor mdl 2, with the two-byte interface feature on the 3838, the 2880 channels on the 168 must be equipped with a similar feature (#7850 or #7851), and the 3032, 3033 and 3042 Attached Processor mdl 2 channels, to which it is attached, must be equipped with (#7850).

When attached to a 3031, 3032, 3033 Processor or the 3042 Attached Processor mdl 2, with data streaming feature on the 3838, in data streaming mode, at up to 3MB/sec., the Processors must be equipped

with Data Streaming Feature (#4850). (On the 3081, 3083, 3084, 4341, 4361 and 4381 data streaming is standard.)

Bulk Storage: Provides independent data storage for up to seven concurrent 3838 users. Seven is the upper limit on 3838 user partitions but is not restrictive of the number of host regions executing 3838 destined jobs. The user partitions may be shared or exclusive. Receives input data from the host and buffers for processing. During processing of algorithm sequences, provides initial, intermediate, and final result data storage. Final results are subsequently transmitted to the host under control of a pending CCW on the block multiplexer channel.

Data Transfer Controller: Provides multiplexing of the internal data busses for concurrent transfers of data between the functional elements.

Arithmetic Processor: Controls algorithm execution for processing vectors through the 100ns/stage pipelined arithmetic unit. Algorithms can be utilized in the application program of individual users to provide comprehensive processing techniques unique to each user. Algorithm control store may be expanded from the basic 16,384 bytes for all mdls with the control store additional feature (#1551) which provides an additional 16,384 bytes of control storage.

Control Processor: Manages the total 3838 subsystem functional operation, synchronizing all data transfers and arithmetic operations, performing logical decisions in algorithm chains, and sequencing multiple users problems through the array processor.

The Instruction Set includes the following vector processing algorithms and logic operations:

Algorithm/Mnemonic:

- a) Arithmetic Instructions (Standard)**
 - Vector Move (VMV)
 - Vector Move Convert (VMC)
 - Scalar Move (SMV)
 - Zero Move (ZMV)
 - Vector Floating Point to Fixed Point Conversion (VFX)
 - Convolving Multiply (CVM)
 - Quadratic Interpolation (INT)
 - Vector Element-by-Element Sum (VES)
 - Scalar Element-by-Element Sum (SSUM)
 - Vector Element-by-Element Multiply (VEM)
 - Scalar Multiply (SMY)
 - Sum of Squares (SSQ)

A brief description of the vector processing algorithm follows:

Vector Element Sum (VES): The VES operation provides a resultant vector Y, the elements of which are a sum of the corresponding elements in vector X and vector or scalar U.

Vector Element Mult., Scalar Mult., or Signed Square Array: The VEM operation provides a resultant vector Y, the elements of which are a product of the corresponding elements in vectors X and U. The SMY operation is a special case of VEM for which U is a scalar quantity. The SSA operation uses the VEM algorithm with two specifications of the X array as the inputs. A sign control option exercised on the first call of the X array allows the sign of the X array to be retained.

Vector Move Convert (VMC): The VMC operation has four subforms, each of which load the Y vector from the X vector. One form (VMV) moves vectors in bulk store, the second form (VMC) converts the X vector from fixed point integer to floating point, the third form (SMV) is used to load a single value (scalar) into all locations of the Y vector, and the fourth form (ZMV) is a scalar load where zero is specified as the scalar value of X.

Sum of Squares (SSQ) or Vector Inner Product (VIP): The SSQ operation takes a vector X and multiplies it on an element-by-element basis with a replica of itself. It then performs an algebraic sum of these squared elements and returns the single element result to a single element Y. Its VIP operation multiplies on an element-by-element basis, a vector U by a vector X. It then performs an algebraic sum of the resultant products and generates a single element result, Y.

Vector Floating Point to Fixed Point Conversion (VFX): The VFX operation converts a copy of the floating point vector X into a fixed point format, and stores it in Y.

Sum or Vector Elements (SVE): The SVE operation performs an algebraic sum of the elements of an X vector and places the sum in a single element, Y.

Array Scan For Maximum (MAX): The MAX operation scans the input vector X and returns in the two element Y vector the maximum value (after application or sign control) and the count of which element in X had that value.

Vector Element Limit (LIM): The LIM operation replaces the elements of the input vector X with specified minimum and/or maximum values if the input values exceed specified minimum or maximum limit values.

Convoluting Multiply (CVM): Resultant vector Y with elements that are a discrete model correlation of the elements in vectors X and U or, by appropriate transposition and translation of the elements in U or X, convolution may be performed.

Divide (DIV): The DIV operation divides input vector U (or scalar (SDIV)) by a second input vector X and places the result in output vector Y.

Nth Zero Crossing (NZCP/NZCN): The NZCP/NZCN operation scans an input vector X and returns in the Y vector:

- 1) The count of the element X that represents the Nth time the data transitioned between positive and negative, and
- 2) The total number of zero crossings. The scan may be in order of increasing index (NZCP) or decreasing index (NZCN).

Quadratic Interpolation (INT): The INT operation performs a table lookup and interpolation function on a table of given data, and set of indicators into this table. The interpolation calculation is along a parabola drawn two points to the left and one point to the right of the chosen location, except where the chosen location is within the first input interval in which case the interpolation is based on one point to the left and two points to the right of the chosen point.

Complex Multiply (CEM): The CEM operation provides a resultant vector Y with complex elements from input vectors X and U each of which have complex elements. The operation may be specified to perform Complex Multiply (CEM), Scalar Complex Multiply (SCEM), Complex Multiply (Complex Conjugate) (CMCC), Complex Multiply (Conjugate Output) (CMCO) or Scalar Complex Multiply (Conjugate Output) (SCMC).

Square Root (SQRT): The SQRT operation takes the square root or the magnitude of an input vector or scalar X and places the result in output vector or scalar Y.

Wiener-Levinson Filter (WLEV): The WLEV operation accepts as its input a characterization of a signal and the type of noise encountered when reading that signal, and produces as an output the coefficients for a digital filter to remove the noise. These coefficients are chosen to minimize the RMS error in the output of a filter when the input consists of the expected signal, plus noise of the expected type.

Fast Fourier Transform (FFT): The FFT operation forms the forward or inverse Fast Fourier Transform in either of two modes: one where the time domain data is known to be complex (FFTC and IFTC) and one where it is real data (FFTR and IFTR).

Polynomial (POLY) (#9301): The POLY operation applies up to a 24th order polynomial expansion to the input vector X using coefficients provided in the U vector. **Prerequisites:** If Recursive Filter (REC) (#9307) or certain Algorithm Design and Development Service additions have been selected in the standard machine, then Arithmetic Element Control Storage Additional (#1551) is required.

Logarithm (LOG) (#9302): The LOG operation determines the logarithm to the base e of an input vector X. **Prerequisites:** POLY (#9301) and Arithmetic Element Control Storage Additional (#1551).

Exponential (EXP) (#9303): The EXP operation provides the antilog to the base e of an input vector X. **Prerequisites:** POLY (#9301) and Arithmetic Element Control Storage Additional (#1551).

Tangent (TAN) (#9304): The TAN operation provides the tangent Y of an input vector X. **Prerequisites:** POLY (#9301) and Arithmetic Element Control Storage Additional (#1551).

Arctangent (ATAN) (#9305): The ATAN operation provides the arctangent Y of an input vector X. The range of Y is 0 to pi radians. **Prerequisites:** POLY (#9301) and Arithmetic Element Control Storage Additional (#1551).

Arctangent 2 (ATN2) (#9305): This alternate version of Arctangent, ATN2, provides the arctangent, Y, of two input vectors, X (X axis) and U (Y axis). The range of Y is 0 to 2 pi radians. **Prerequisites:** POLY (#9301) and Arithmetic Element Control Storage Additional (#1551).

Recursive Filter (REC) (#9307): The REC algorithm implements a first order recursion equation where the elements of Y are a function of: previous values of Y, a Y coefficient vector U, an input vector X, and a scalar coefficient which is the first element of the U vector. **Prerequisites:** If Polynomial Expansion (POLY) (#9301) or certain Algorithm Design and Development Service additions have been selected in the standard machine, then Arithmetic Element Control Storage Additional (#1551) is required.

Vector Reverse (REV) (#9308): The REV operation reverses the ordering of real data for an input vector X.

Control Storage Requirements: The instruction set available on the 3838 consists of logic operations which are executed in the control processor and vector operations which are executed by the arithmetic processor. The arithmetic processor contains a 16,834 byte reloadable control store which contains the algorithms necessary to accomplish the vector operations. These are loaded when the 3838 is IPL/IMPLed from the host system. Selected arithmetic instructions from the optional arithmetic algorithms may be added to the standard arithmetic algorithms, or additional algorithms may be added to the product via the Algorithm Design and Development Service capability. When the capacity of the 16,384 bytes or control store is exceeded it is necessary to add feature #1551 Control Storage Additional (see "Special Features").

3838 Array Processor (cont'd)

Algorithm Prerequisites: Prerequisite machine or specify features for optional algorithms are as follows:

1. Vector Reverse (REV) (#9308) and either POLY (#9301) or REC (#9307) can be added to the standard machine.
2. Polynomial Expansion (POLY) (#9301) is a prerequisite for LOG (#9302), EXP (#9303), TAN (#9304) and ATAN/ATN2 (#9305).
3. Any or all of the remaining optional algorithms (POLY) (#9301) or REC (#9307), LOG (#9302), EXP (#9303), TAN (#9304) and ATAN/ATN2 (#9305) require Arithmetic Element Control Storage Additional (#1551).
4. Algorithms provided by the Algorithm Design and Development Service may or may not require Arithmetic Element Control Storage Additional (#1551) depending upon optional algorithm selections or complexity.

Bibliography: GC20-0001

SPECIFY

- Power (AC, 3-phase, 4-wire, 60 Hz): Must be consistent with system voltage. Specify #9903 for 208V, #9905 for 230V. **Field Installation:** Yes. **Note:** 50 Hz sources will require a 50/60 Hz converter.
- Color: Specify #9041 for Red, #9042 for Yellow, #9043 for Blue, #9045 for Gray, #9046 for White.
- Cabling: #9080 for below floor, #9881 for on floor. **Field Installation:** Yes.
- Configuration: #9092 for additional 3838s in configuration (excludes first unit).
- Arithmetic Instructions

Polynomial Expansion #9301	Arctangent #9305
Logarithm #9302	Recursive Filter #9307
Exponential #9303	Vector Reverse #9308
Tangent #9304	

SPECIAL FEATURES

Two-Byte Interface (#7850): Provides two-byte parallel transfer on the 2880 Block Multiplexer Channel to achieve data transfer rates up to 3.0MB/sec. **Maximum:** One. **Prerequisites:** #7850 or #7851 on 2880, or #7850 on a 3032, 3033, or 3042 Attached Processor mdl 2. **Field Installation:** Yes.

Data Streaming Feature (#4850): Provides attachment of the 3838 in Data Streaming Mode to channels on the 303X, 3042 Attached Processor mdl 2, 4341, 4361, 4381, 3081, 3083, and 3084. **Limitations:** The 3838 must be transferring data to and from the host processor channels in 4-byte (full word) multiples. **Maximum:** One per 3838. **Prerequisites:** On the 3838, #7850 is a prerequisite. If attached to the 303X and 3042 mdl 2, #4850 is required on the processor. **Field Installation:** Yes. Parts removed in the installation of this feature become the property of IBM.

Arithmetic Element Control Storage, Add'l (#1551): An additional 16,384 bytes of control store for additional algorithm capabilities. Custom algorithms are requested by Algorithm Design and Development Service. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

Field Installable.

ACCESSORIES (None)

SUPPLIES (None)

3843 LOOP CONTROL UNIT

PURPOSE

A signal converting unit used to provide loop capability at remote locations via a telecommunications link to one of the following:

- IBM 3630 Plant Communication System
- IBM 4331 Mdl Group 1 or 2 Processor
- IBM 8100 Information System.

The 3843 must be installed at the same site as the loop. The 3843 controls loop operation and provides an EIA/CCITT interface for attachment of an external synchronous modem. External non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Refer to M2700 pages.

MODELS

Model 1 001

HIGHLIGHTS

A 3843 loop may be up to 3.2 cable-kilometers (2 cable-miles) in length. All terminals that can attach to a 3631/3632 loop, a 3842 loop, an 8100 direct-attached loop or 4331 loop via the 4331 loop adapter may be attached to the 3843 loop. The 3843 controls polling and with one poll command addressed to it, can provide responses from all loop-attached terminals.

The 3843 operates at loop speeds of up to 9600 bps and will transmit/receive data over the telecommunication link at a speeds of 2400, 4800, or 9600 bps.

Communications: The 3843 functions with a synchronous modem (modem clocking) that transmits at 2400, 4800, or 9600 bps on a 2- or 4-wire half-duplex nonswitched telecommunication link, with or without backup on the public switched network. The electrical characteristics of the EIA/CCITT interface comply with EIA recommendations RS-232-C and RS-334 (for U.S.), CCITT recommendations (1976) V.24/V.28, ISO standard 2110 and other relevant CCITT recommendations. The interface supports modems functioning as recommended in CCITT V.26, V.27, V.27 and V.29. The 3843 also supports the test control line used by IBM modems. IBM modem attachment support:

Modem	Speed (bps)	Lines
3833 mdl 1	2400	Nonswitched voice grade
3834 mdl 1	4800	Nonswitched voice grade
3863 mdl 1	2400/1200	Nonswitched voice grade
3864 mdl 1	4800/2400	Nonswitched voice grade
3865 mdl 1/2	9600/4800	Nonswitched voice grade
3868 mdl 1	2400/1200	Nonswitched voice grade
3868 mdl 2	4800/2400	Nonswitched voice grade
3868 mdl 3/4	9600/4800	Nonswitched voice grade
3872 mdl 1	2400/1200	Nonswitched voice grade
5811 mdl 10	2400 to 9600	Limited Distance Modem
5811 mdl 18		Rack mount

5811 mdl 20	2400 to 9600	version of mdl 10 Nonswitched baseband Rack mount version of mdl 20
5812 mdl 10	2400 to 19200	Nonswitched baseband Rack mount version of mdl 10
5812 mdl 18		Nonswitched voice grade Rack mount version of 5865 mdl 2
5865 mdl 2/3	9600/7200 4800	
5868 mdl 52		

Note: 4-wire Switched Network Backup is available on 3863, 3864, and, 3865 modems with feature #7953 installed. 2-wire Switched Network Backup is available on 5865 modem with feature #7952 installed. See your TCM branch/TP coordinator for country limitations.

Nonswitched Lines: PTT (common carrier)-provided telecommunication lines of voice grade quality. The actual line specification is dependent upon the attached modem selected to support the 3843. Duplex 4-wire required for multipoint and also recommended for point-to-point.

Privately-Owned Communication Facilities: Equivalent to the above.

Public Switched Telecommunication Networks: The customer must be advised that satisfactory data transmission depends on the characteristics of the particular switched network facilities being used. Refer to M2700 pages for further details.

International Facilities: Transmission of data between the United States and Canada on nonswitched facilities is supported (US type 3002, Canada schedule 4, type 4). For Data transmission between all countries, request your country TP coordinator to contact the coordinator in the other countries involved to determine the availability of the required telecommunication facilities.

Related Equipment: The 3843 communicates with an appropriately configured 3631 or 3632 with EIA/CCITT Interface - Data Link (#3703) and Data Link Adapter (#3211), a 4331 Mdl Group 1 or 2 Processor with Data Link Adapter (#4840) or to an 8100 system with EIA Interface Adapter (#3701) and Communications Adapter Without Clock - SDLC (#1602). For communications capabilities, product utilization and special features, refer to M2700, 3630, 3631, 3632, 4331, 8101, 8130, and 8140 pages.

Problem Determination Aids: Can execute online diagnostic commands to perform self-tests, to assist in locating loop wiring or terminal failures at the remote site.

A Speed Select Switch is provided. This allows the 3843 to switch loop data speed to half-speed providing the externally attached modem has a half-speed capability. Modems with this capability can also be remotely switched to half-speed operation via the Speed Select Switch if they provide a 'Data Rate Select' control line to the 3843.

Off-line tests are provided to perform self tests of the 3843 with or without involving loop wiring and/or loop terminals.

Physical Environments: The 3843 Loop Control Unit has been designed for operation in physical environments characteristic of office areas. See "IBM 3630 Plant Communication System, System Description", GA24-3652 or "Introduction to the 8100 Information System", GA27-2875.

MACHINES

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages and the pertinent section of the "IBM 3630 Installation Manual Physical Planning", GA24-3675, and the "IBM System 3630 Plant Communications System Loop Installation - Physical Planning", GA24-3676, or the "IBM 8100 Information System Site Planning and Preparation Guide for IBM 8101, IBM 8130, IBM 8140", GA27-2844, or the "4331 Processor Installation Manual-Physical Planning", GA24-3667.

The customer is responsible for the following:

1. Arrangement for price quotations, installation and all costs of external modem and its associated equipment, services, and telecommunication facilities.
2. Purchase, installation, testing, and maintenance of the loop cabling systems. Purchase a Loop Continuity and Relay Tester, if required. (See "IBM 8100 Information System Loop Installation Manual - Physical Planning Guide", GA27-2878, or the "4331 Processor Installation Manual-Physical Planning", GA24-3667.
3. When installed on a 3630 Plant Communication System, the 3843 must be installed near a 3643. When installed on an 8100 System, the 3843 must be installed near a 3276 Control Unit Display Station, a 3278 Display Station, or an 8775 Display Terminal. When installed on a 4331 System, the 3843 must be installed near a 3641 or 3643 terminal when 3640 terminals are attached, when only 3287, 3775, 3276, or 3274 with their associated terminals are attached, test invocation is only possible from the Operator's Console. These devices are required for remote loop installation, problem determination procedures, and maintenance.
4. Providing voice communications between the 3843 and the controller/processor locations to coordinate tests. The voice facility must be located in such a way that the operator can use it while operating the controls on the front of the 3843.
5. Providing a wrap type Loop Station Connector for the 3843.
6. Physical setup, connection of cables to communication lines/modems and IBM devices incorporating protected customer access areas, switch settings and check out.
7. Contact Customer Engineering to make cable connections of IBM CSU units to non-CSU units where access areas are not provided.

Bibliography: IBM 3630 Plant Communication System, System Description, GA24-3652

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901
123.5V #2811	200V #2732
200V #2806	208V #9902
220V #2813	230V #9904
235V #2814	

Notes: 235V AC is compatible with existing 240V AC Systems.
115V AC is compatible with existing 120V AC Systems.

Machine Nomenclature:

English #2927	German #2929
French #2928	

Power Cord: #2710 for 50 Hz -- #2906 for 60 Hz or for Japan 50 Hz.

Related Equipment: To provide applicable documentation, specify #9560 if the 3843 will be part of a 3630 System, #9569 if the 3843 will be part of an 8100 System or #9565 if the 3843 will be part of a 4331 Processor.

Loop Station Connector Cable: A 2.1m (7 ft) cable is provided as standard. If a 4.2m (14 ft) cable is desired, specify #9410.

Interconnection Cable to Modem: A 6.0m (20 ft) interconnection cable is provided as standard for attachment to the modem. If other than a 6.0m cable is required, specify #9021 and indicate 10 for a 3.0m (10 ft) cable, 30 for a 9.0m (30 ft) cable, or 40 for a 12.0m (40 ft) cable. (Japan only) For additional adapter cable: If operation will be with an NTT modem, specify #2946.<)

MACHINES

3848 CRYPTOGRAPHIC UNIT
PURPOSE

An auxiliary unit that enciphers and deciphers data when attached to the Virtual Storage S/370 mdls 135-3 through 168, and the 4331, 4341, 4361, 4381, 3031, 3032, 3033, 3081, 3083, 3084, and 3090 Processors.

MODELS
Model 1 001

Prerequisites: Each 3848 requires a control unit position on a block multiplexer or selector channel.

A key entry unit (accessory) must be available for use with the 3848.

For communication security, the 3848 and the Cryptographic Unit Support Program Product require terminals that include the Encrypt/Decrypt feature (#3680) and either the ACF/VTAM (Program Product #5735-RC2), Encrypt/Decrypt feature (#6010), or ACF/TCAM Version 2 (Program #5735-RC3).

HIGHLIGHTS

Provides data encryption capability for file and communications applications. The encryption process implements the Data Encryption standard (DES) published by the U. S. National Bureau of Standards as Federal Information Processing Standard (FIPS) #46 January 15, 1977.

A block chaining mode of operation is used with the DES algorithm to further disguise formatted data.

The user selected master key is maintained securely in a special storage element protected by a battery during power off periods. The master key entry process is protected by a physical key.

Master key entry is performed via a small hand-held key entry unit available as an accessory.

Attachment can be to a block multiplexer or selector channel. The maximum data rate is 1.5 megabytes per second. When attached to channels capable of 3.0 megabyte/ second data streaming and operating in data streaming mode (CE selectable) the 3848 maximum data rate is 3.0 megabytes per second.

Definition of selected key-encrypting keys as two 56-bit values provides a greater effective key length than the single 56-bit DES key.

Programming Support: Support for the 3848 is provided by the Cryptographic Unit Support program product (5740-XY6). This program provides the access method, error recovery and error recording for one or more 3848 units. Additionally, it provides generation and management control functions for cryptographic keys.

Customer Responsibilities: Primary customer responsibilities for using the 3848 Cryptographic Processor are:

- Generating Cryptographic keys. The master key must be selected by the user. The Cryptographic Unit Support program product (5740-XY6) may be used to generate key-encrypting and data-encrypting keys.
- Providing adequate physical protection measures for the computer system to which the 3848 is attached. Access to the 3848 and the support program product should be limited to authorized users.
- Maintaining secure duplicate copies of the key-encrypting keys used. A lost key precludes decrypting and results in loss of data.

Minimum Systems Requirements: The 3848 was designed to operate with the Cryptographic Unit Support program product or its equivalent. In combination, these products assist in safeguarding sensitive information. Neither product alone can provide the same function or the same degree of security as this combination.

The use of the 3848 without the error recovery and recording functions of the Cryptographic Unit Support program product will reduce the availability and maintenance characteristics of the Cryptographic Unit.

The Cryptographic Unit Support Program Product is supported in OS/VS 2 MVS (Release 3.9) and OS/VS 1 environment. Use with OS/VS 1 requires the Basic Programming Extensions Program Product (5662-257).

Operation with the S/370 mdl 145 requires Advanced Control Program Support (#1001). Attachment to any channel of a mdl 145 with four selector channels installed, or to the third selector channel of a mdl 145 with three selector channels installed requires the Word Buffer (#8810) on the mdl 145.

Bibliography: GC20-0001

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Voltage (AC, 1-phase):

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble grey, #9066 for pearl white.

- Language Groups:

Canadian French #2935	Italian #2932
English #2924	Spanish #2931
French #2928	

SPECIAL FEATURES (None)
MODEL CONVERSIONS (None)
ACCESSORIES

Personalization/Key Entry Unit (#0501): This item is available on a purchase-only basis. Order by feature number for delivery with the 3848 or by P/N 4407908 for delivery at any other time. To enter the master key and to facilitate certain service functions, one unit must be available at each site having one or more 3848 Cryptographic Units.

SUPPLIES (None)

3851 MASS STORAGE FACILITY (MSF)

PURPOSE

Large-capacity storage and control facility for the 3850 Mass Storage System (MSS) for attaching to S/370 models 145, 145-3, 148, 155II, 158, (Japan only > 158 submdl 2, <) 165II and 168, or a 3031, 3032, 3033, 3081, 3083, 3084, 3090 Processor, or a 4341 or 4381 Processor.

MODELS

A-Series: One Mass Storage Control

B-Series: Two Mass Storage Controls -- one MSC is the active control -- the second is an alternate control.

Mdl	Capacity No of Cart.	Max Bytes (Bills)	Data Recding Devices	Data Recding Cntnl
A01/B01	706	35.3	2	1
A11/B11	2044	102.2	2	1
A21/B21	3382	169.1	2	1
A31/B31	4720	236.0	2	1
A02/B02	2044	102.2	4	2
A12/B12	3382	169.1	4	2
A22/B22	4720	236.0	4	2
A03/B03	3382	169.1	6	3
A13/B13	4720	236.0	6	3
A04/B04	4720	236.0	8	4

Maximum: Attaches to a maximum of four S/370s (any combination of UPs, MPs, APs) or 3031, 3032, 3033, 3081, 3083, 3084 or 3090 Processor Complexes (maximum two multiprocessor systems) or 4341 or 4381 Processors.

A maximum of two 3851 MSFs from the A-series of mdls or one 3851 MSF from the B-series of models can be included in the 3850 MSS.

In a 3850 MSS there is one active Mass Storage Control (MSC). It can address a total of eight 3850 MSS components: 3851 MSF control function, 3830 Storage Control mdl 3s, and Integrated Storage Controls (ISC) (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168. (Each ISC counts as two components). The number of 3850 MSS components addressed can be increased to 16 with installation of the MSC Twin Port Feature (#4901, #4902). A second MSC (either a B-series or the second A-series) may be designated as an alternate control.

Limitations: In a 3850 MSS configuration with one 3851 MSF (B-series) or two 3851 MSFs (A-series), both MSCs must be featured identically if complete backup is required. Note: On a 2880 Block Multiplexer Channel, Extended Unit Control Words (#3851, 3852) may be required to expand DASD device address capacity. The 155II System configuration is restricted by the maximum number of non-shared block multiplexer subchannels (in groups of eight). See the Channel Section of the Guide to IBM System/370 Model 155, GC20-1729, for description of assignment and number available. The total device addresses (real, virtual, non-existent, or non-Mass Storage System) SYSGENed may not exhaust the pool of nonshared UCWs. (Japan only > The same limitations apply to the 158 submdl 2, <.)

HIGHLIGHTS

Included are the storage facility for data cartridges, Data Recording Devices (DRD) and their associated Data Recording Controls (DRC) for the transfer of data between the data cartridges and the 3350/3333/3330 Disk Storage devices, a Cartridge Access Station for the manual entry and removal of data cartridges, two accessors and their associated controls for the movement of data cartridges within

the 3851, and a Mass Storage Control (MSC) for control of the 3850 MSS.

Prerequisites: A control unit position on a S/370 or a 4341 or 4381 Processor, byte or block multiplexer channel for each MSC -- one for each A-series MSF, two for a B-series MSF.

A minimum of one 3830 Storage Control mdl 3 on S/370 mdls 145, 145-3, 148, 155II, 158, (Japan only > 158 submdl 2, <) 165II and 168, or a 3031, 3032, 3033, 3081, 3083, 3084, 3090 Processor, a 4341 or 4381 Processor or one Integrated Storage Control (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168.

A minimum of either two 3333 Disk Storage and Controls or two 3350 mdl A2/A2Fs. See "Note" on M3333 pages for feature changes required when 3333s are retained for use with a 3851.

Data Cartridges (P/N 2496971, Purchase Only) must be ordered separately; contact IBM.

Publications: GC20-0001

SPECIFY

- Power (AC, 3-phase, 4-wire): Must be consistent with system voltage.

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819	
- Color: The accent panels above and below the cartridge access station are white. The two end covers on the 3851 MSF are gray. The remainder of the 3851 is available in #9041 for red, #9042 for yellow, #9043 for blue, #9045 for gray, or #9046 for white. Field Installation: Yes.
- In a 3850 MSS configuration with two A-series MSFs, specify #9120 for the designated primary 3851 MSF and #9121 for the secondary 3851 MSF.
- Language Groups:

English #2927	Japanese #2930
French #2928	Spanish #2931
German #2929	
- Specify #2886 for cover latch.

SPECIAL FEATURES

Note: In a 3850 MSS configuration with one 3851 MSF (B-series) or two 3851 MSFs (A-series), both MSCs must be configured identically if complete backup is required.

Mass Storage Control Twin Port (#4901, #4902): (#4901 for A and B mdls -- #4902 for B mdls only) #4901 applies to the A-series MSC and the first MSC in a B-series. #4902 applies to the second MSC in a B-series, and requires #4901 as a prerequisite. Permits the MSC to address 8 additional, for a total of 16, 3850 MSS components: 3851 MSF control functions*, 3830 Storage Control mdl 3s on S/370 mdls 145, 145-3, 148, 155II, 158, (Japan only > 158 submdl 2, <) 165II and 168, or 3031, 3032, 3033, 3081, 3083, 3084, 3090 Processor, or a 4341 or 4381 Processor, and ISC (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168. Each ISC has two paths and counts as two components.

* In a 3850 MSS configuration with two A-series mdls there are two 3851 MSF control function components.

Remote Switch Attachment (#6148): To control the two-channel interfaces on the basic 3851 MSF from a remote configuration control panel. Also controls the Two-Channel Switch, Add'l (#8171) if installed. For B mdls, this feature is associated with the primary MSC and must be installed in addition to #6150 below, which is associated with the alternate MSC. Field Installation: Yes.

Remote Switch Attachment (#6150): (B mdls) To control the two-channel interfaces on the basic 3851 (alternate MSC) from a remote configuration control panel. Also controls the Two-Channel Switch, Add'l (#8172) if installed. Field Installation: Yes. Prerequisites: #6148.

Two-Channel Switch, Add'l (#8171): Permits attachment to two additional S/370, 30XX, 4341, or 4381 processor channels, providing a total of four S/370, 30XX, 4341, or 4381 processor channel attachments. The channels can be on the same or different processors, to a maximum of four processors with no more than two channels to a single processor. For B mdls, the feature is associated with the active MSC and must be installed in addition to #8172 below, which is associated with the alternate MSC. Field Installation: Yes.

Two-Channel Switch, Add'l (#8172): (B mdls) Permits attachment to two additional S/370, 3090, 4341, or 4381 processor channels, providing a total of four S/370, 3090, 4341, or 4381 processor channel attachments. The channels may be on the same or different processors, to a maximum of four processors with no more than two channels to a single processor. Field Installation: Yes. Prerequisites: #8171.

MODEL CONVERSIONS

Field installable. Any A model can be upgraded to any larger A model or any B model. Any B model can be upgraded to any larger B model.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3852 COLOR PRINTER AND JETPRINTER

PURPOSE

The 3852 Color Printer and the Color Jetprinter 3852 2 Color Printer produce color graphics and text on transparencies and paper. Both are seven-color, bi-directional, all points addressable, drop-on-demand ink jet printers with the following resolutions:

3852 Model 1	84 X 84 pels per inch
Color Printer	84 X 63 pels per inch
3852 2	
Color Jetprinter	100 X 72 pels per inch (Draft text)

Attachments for these printers are as follows:

3852 Model 1	3270-PC,
Color Printer	3270-PC/G,
	3270-PC/GX
3852 2	
Color Jetprinter	3270-PC/G,
	3270-PC/GX,
	3179 Model G
	3192 Model G
	3979 Model 1

MODELS

Model 1 001 (Canada only > (No Longer Available) <)

Model 2 002

Customer Setup (CSU): Both models are customer setup only. Customer setup allowance is one day. Setup documentation is included with each printer. No special tools are required.

HIGHLIGHTS

These color printers provide convenient color graphics and text output in a quiet low-profile office printer. The 3852-2 provides enhanced text functions, including near letter quality and draft text, condensed print, and superscript and subscript printing. Print speed in the normal text mode is up to 30 characters per second in 10-pitch and 50 cps in 16.7-pitch. For the 3852 Color Printer it is up to 37 characters per second in 12-pitch.

When in the graphic modes, print speed is 3100 pels per second for both models.

- IBM PC, PC/XT, PC/AT, PCjr., PC Portable, and 3270-PC, 3270/PC/G, and 3270-PC/GX in Native PC mode (operating as a PC with DOS 2.1 or higher and not with the control program) (Model 2 only):
 - Supports a wide variety of text and graphics screen and file printing in black and colors from IBM and non-IBM software applications.
- 3179 Model G, 3192 Model G:
 - Color screen copy support is provided.
 - Host-directed alphanumeric-only print support is provided.
- 3270-PC Attachment:
 - In MFI sessions, the 3270-PC will support text screen copy only, which can be printed on either printer.
 - In PC session, the 3270-PC supports text screen copy and PC graphics screen copy (with the 3270-PC graphics adapter card) and either can be printed on the printers.
- Printer Dimensions:

Width - 400mm (15.75 in)
Depth - 295mm (11.62 in)
Height - 114mm (4.49 in)
Weight - 5.6 kg (12.4 lbs)

Standard Features: Both 3852 Models 1 and 2 provide:

- Dual ink cartridges - one with black ink, the other with three primary colors, which allow the printing of seven colors:
 - Black
 - Blue
 - Cyan
 - Green
 - Magenta
 - Red
 - Yellow
- Capability for all-points-addressable color graphics.
- Special microperforated roll-feed paper. (A paper cutting edge is a standard feature.)
- Special cut-sheet paper with sheets being manually inserted.
- Special transparencies are available and are manually inserted.
- Two character sets are resident for standard character printing. The first character set is the 3270 Extended character set and includes multilingual support through the characters shown on Code Page 00500 of IBM Registry of Graphics Character Sets and Code Pages. The second character set is the PC Graphics Character Set 2.
- Six and eight lines per inch text supported.
- Normal and bold print intensities.
- Very quiet printing: 46 dBA.

Model 1 Features: Features unique to the 3852 Color Printer include:

- Printing pitch supported is 12-pitch

Model 2 Features: Features unique to the 3852 2 Color Printer include:

- Printing pitches of 5, 8.3, 10, and 16.7 characters per inch
- 8-inch writing line supported for both text and graphics
- 132 characters per line in condensed print
- Near letter quality as well as draft text
- Special microperforated continuous form paper is supported for use with the pin feed mechanism
- Resolutions of 100 X 96 pels per inch and 100 X 72 pels per inch
- Nine fonts available including superscripts/subscripts

Control Panel: The following switches are provided on the control panel:

Form Feed
Line Feed
On-Line/Off-Line

The following indicators are provided on the control panel:

Ready
Check
Power

Other switches include:

On/Off (Located on the right side of the printer)
Bold Mode (Located On back panel of printer)

Technical Data (Model 2 only)

- Acoustics - 46 dBA
- Maximum print width - 8 in. text
- Paper widths - 8 1/2 in. and 8.27 in. (A4 width)
- Paper Weights - 20 to 24 pounds.

Note: The 3852 Model 2 will print on most papers. For optimum color and print quality, special coated paper is recommended.

- Printer Speeds - Vary according to pitch used. (Bold mode printing is half of the speeds shown below.)

Characters /Inch Pitch	Print Speed	
	Near Letter Quality	Draft Quality
5	10	15
8.3	16	25
10	20	30
16.7	33	50

- Character Spacing: 5, 8.3, 10, and 16.7 characters/inch
- Line Spacing: 6 and 8 lines/inch
- Character Sets: 2 (of 230 characters each)
- Languages supported:
 - Danish, Dutch, English, Finnish, French, German, Italian, Norwegian, Portuguese, Spanish, and Swedish
- Fonts:
 - PC Graphics Character Set 2
 - 3270 Extended Character Set
- Ink Cartridges: 2 (One with black ink and one with 3 primary color inks)
- Printer Diagnostics:
 - Operator initiated at power on
 - Operator initiated print quality check
- Interface: IBM PC parallel interface
- Certification:
 - U/L 478, CSA 22.2 #154, VDE 871 and 806
 - IEC 380, TUV (GS Mark) EIF
- Power:
 - 120V +/- 10%, 60 Hz
 - 220/230/240 +/- 10%, 50 Hz
 - 100V +/- 10%, 50/60 Hz

Paper Supply

- Cut sheet dimensions are 216mm width (8.5 in.) by 279mm length (11 in.).
- Roll paper width dimension is 216mm (8.5 in.). The continuous form, fan-fold paper is microperforated at 8.5 inches or 8.27 inches. Length dimension perforation for fan-fold paper is 11 inches.
- Paper and transparency thickness must be 0.095mm +/- 0.005mm.

Attachment: Attachment to all hosts is via an 8-bit PC parallel interface.

Required Software: IBM PC, PC/AT, PC/XT, PCjr, PC Portable: DOS Release 2.1 or higher, with print driver modification included. This print driver modification code is contained on the diskette which is shipped with each 3852 Model 2.

3270-PC: 3270-PC Control Program Version 2.0 for color screen copy.

Operating Environment

Temperature - Class B. 18 to 32.0 degrees C (60 to 90 degrees F)
Relative Humidity - 20 to 80 percent

Printer Compatibility Legend: A - The software application will function with the IBM PC Graphics Printer (5152).

- a - Same as "A" above but some restrictions apply
- B - Same as "A" plus color text
- C - Same as "A" plus color graphics
- D - Same as "A" and color text and color graphics are supported
- d - Only color screen copy is supported
- E - Same as "A" with some enhancements supported
- N - Not recommended by software publisher

SPECIFY

Model Type

- 3852 Model 1 Color Printer - P/N 1348520
- 3852 2 (120V non-US) - P/N 1686265
- 3852 2 (220/230/240V) - P/N 1686266
- 3852 2 (100V) - P/N 1686267

Note: Each of the above part numbers for the 3852 Model 2 automatically configures the following printer types:

(P/N 1686265): Universal symbol control panel, 60 Hz, 120V AC +/- 10%, 0.3 Amps.

(P/N 1686266): Universal Symbol control panel, 50 Hz, 220/230/240V AC +/- 10%, 25 Watts.

(P/N 1686267): Universal symbol control panel, 50/60 Hz, 100V AC +/- 10%, 25 Watts

Printer Cable: Specify for each printer: For attachment of 3852 Models 1 and 2 to PC, PCjr, PC Portable, PC/XT, PC/AT, 3270-PC, 3270-PC/G, and 3270-PC/GX workstation control units:

P/N 1525612 #5612

I For attachment of the 3852 Model 2 to the 3179 Model G/3192 Model G terminal:

P/N 6342058 #2058

Printer Power Cord: Specify required if non-US printer.

Location	P/N
Australia	5640664
Hong Kong	5640662
New Zealand	5640664
Singapore	5640662
All Others	5640660

Color: (No Specify required) Pearl White.

SPECIAL FEATURES (NONE)

SUPPLIES

Paper:

- Roll Paper, P/N 6293884
8-1/2 in. X 11 in. microperforated
4 rolls/box
- Cut-Sheet Paper, P/N 6293935
8-1/2 in. X 11 in.
250 sheets/pkg.

MACHINES

- Continuous Fan-Fold Pin-Feed Paper, P/N 1669311
8-1/2 in. X 11 in. (210mm X 279.3mm) microperforated
250 sheets/pkg.
- Transparency Sheets, P/N 6293933
8-1/2 in. X 11 in.
50 sheets/pkg.

Ink Cartridges:

Black Ink Cartridge, P/N 6293886
Color Ink Cartridge, P/N 6293888

Font Selection: No Specify required.

ACCESSORIES (NONE)

3863 MODEM

PURPOSE

A 2400 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of network errors -- alert messages on error threshold -- formatted modem test results.

MODELS

- | **Model 001 (No Longer Available):** Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point, multipoint control, or multipoint tributary mode.
- | **Model 002 (No Longer Available):** Operates in half-duplex mode over 2-wire switched telecommunications networks. Operating mode is point-to-point.

Customer Setup: The 3863 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 1 modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches.

Note: Some changes of the setup switches may require SYSGEN changes in the program support.

(Except Canada > In countries where Customer Setup is prohibited or impractical, terms and conditions will include CE support for installation. Contact IBM to find out if Customer Setup applies. <)

HIGHLIGHTS

- Volume purchase price reductions are available for quantity purchases.
- A high density rack-mounted version of the 3863 mdl 1 is available for central teleprocessing installations. See section "Related Equipment" below and "M3868" pages.

Standard Features

- Data Rate: 2400 bps with backup of 1200 bps.
- A microprocessor for signal processing.
- Auto Answer - Automatic answering of switched network calls - mdl 2 -- SNBU - mdl 1.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (2400/1200 bps) of the local modem. (Except Canada > Not available with V.26bis. <)
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- World Trade Public Switched Network Adapter is built in, which permits direct attachment to the Switched Network (when allowed by local PTT regulations).
- Conforms to CCITT Recommendation for Switched Network for V.26bis. Cannot use Automatic Remote Speed Selection.

- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. (Except Canada > (LPDA functions are not supported with V.26bis). <) Under control of these programs, the modem accepts commands and initiates tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
 1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
 2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either "Receive Signal Level Reporting" or "LPDA Functions on Tailed Links" is needed, Version 3 (PP 5668-920) is required.
 3. ACF/NCP Version 2 (PP 5735-XX1). Note: The functions "Receive Signal Level Reporting", and "LPDA Functions on Tailed Links" are not supported by this level.
- Modem provides its own clocking or will accept DTE (external) clocking.
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100 meters (328 ft.) long when the modem is attached to a 3705, 3720, 3721, 3725, or 3726 Communications Controller or equivalent. See M3705, 3720, 3721, 3725, 3726 pages for details.

Optional Features: See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-Wire Switched Network Backup: Provides backup for non-switched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.
- Direct Line Attachment: Provides the safety barrier required by the UK British Telecommunications for Data Terminal Equipment not meeting UK safety requirements.
- LPDA Functions on Tailed Links: Allows tailed 3863 mdl 1 to respond to LPDA diagnostic commands.

Diagnostics: Built-in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 or 4300 processor or System/36 or 9370 Processor for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report "Receive Signal Level", a 3863 mdl 1 must have serial number suffix code of HD or later. If the serial number suffix code is earlier, RPO 8Q0317 must be installed.

To respond to LPDA commands, a 3863 tailed to a 3865 with Data Multiplexer feature #3620 must have LPDA Function on Tailed Links feature #4791 installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Prob-

able cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3863 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.
- Lamp test -- tests all indicator lights on the operator panel.

COMMUNICATIONS FACILITIES MDL 1

PTT Facilities: Telecommunications lines of a normal quality for data transmission can be used. See IBM for the availability of such facilities in your country.

Privately-owned Communication Facilities: Equivalent to above.

COMMUNICATIONS FACILITIES MDL 2 AND MDL 1 WITH SWITCHED NETWORK BACKUP (#7953)

Public Switched Network: (Canada only> 2-wire switched line with an exclusion key telephone.<) (Except Canada> The characteristics of the switched line are those of the public switched network as described by the PTT in each country.<) The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

(Canada only> Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4.<)

Attachment to Facilities: (Canada only> The cables supplied to attach the 3863 mdl 2 and the 3863 mdl 1 with Switched Network Backup (#7953) to the public switched network are terminated with spade lugs for attachment to a CBS type data coupler (WE 1001A, series 5 or later, or WE 1001F or equivalent) which is provided by the telecommunications service supplier.<) (Except Canada> The proper cable and terminating plug will be provided to each country which has customer setup. There will be a nonswitched cable, a switched cable or a nonswitched and two switched cables if Switched Network Backup (#7953) is added as a feature.

In the case of either Switched Network or Switched Network Backup, the modem includes the World Trade Public Switched Network Adapter (WT PSN Adapter) which permits direct attachment to the switched network in World Trade countries (when allowed by local PTT regulations). Contact IBM to determine whether the Switched Network modem or the Switched Network Backup feature is allowed in your country.<)

(Except Canada> Note: Each modem is configured for the country for which it is ordered. Line Adapters will vary by country.<)

(Canada only> An exclusion key telephone set<) (Except Canada> A telephone set (handset)<) is required with switched facilities at locations where calls will be originated. Two telephone sets are required with 4-Wire Switched Network Backup (#7953). Answer only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3863 Modem operates with IBM communication products capable of 2400 bps operation. See M2700 pages. The 3863 Modem must communicate with another appropriately configured 3863 Modem or with a 3868 mdl 1 Rack-Mounted Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the "Introduction and Site Preparation Guide", (GA27-3200).

The customer is also responsible for:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".
3. Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device.
4. Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.
5. Unpacking and placing of the 3863. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the "IBM 3863/3864 Setup Instructions and User's Guide", (GA27-3216).
6. Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
7. Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
8. All three of the following program products must be installed for LPDA to function:

NCCF -- NPDA -- and ACF/NCP

See section "Standard Features" above for required release levels.

9. (Except Canada> The 3863 mdl 2 complies with CCITT recommendations V.25 (as it pertains to answering equipment) and V.26bis for operation over international public switched networks and is normally line compatible and suitable for transmission of data with other manufacturer's modems that comply with these recommendations. However, satisfactory

transmission of data cannot be guaranteed over all international connections.

In those cases where it is necessary (PTT regulations for example) for an IBM 3863 to communicate with another manufacturer's modem, it is the customer's responsibility to ensure that the non-IBM modem:

conforms to CCITT recommendations V.25 and V.26bis
uses CCITT coding method alternative B
uses ready for sending delay of 200 to 275 ms.

In the event of unsatisfactory transmission of data with a non-IBM modem, the customer must follow IBM problem determination procedures by connecting the 3863 to another 3863 prior to calling for service. < >

Bibliography: See KWIC Index, G320-1621, or specific systems bibliography.

SPECIFY

- Power (AC, 1-phase, 3-wire): 3.0m (10 ft.) power cable.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #9901
220V #2813	127V #2823
230V #2821	200V #2732
240V #2801	208V #9902
	220V #2803
	240V #2831

- Specify #2998.
- The 3-digit country code is used to select a power cord and plug which meets the requirements of that country.
- Specify one of the following for power safety labels for the country of installation:

English/		
French	#0935	Italian #0932
English	#0924	Japanese #0930
French	#0928	Portuguese #0933
German	#0927	Spanish #0931

- (Except Canada > If one of the above is not specified, the power safety labels will be English (#0924). < >
- (Canada only > If one of the above is not specified, the power safety labels will be bilingual English/French (#0935). < >
- Language Groups:

Canadian		
French	#2935	German #2929
English	#2924	Japanese #2930
French	#2928	Spanish #2931

If one of the above is not specified, the language group will be in English (#2924).

- Telecommunications Cable (modem to telecommunications line connection): 7.5m (25 ft.) (no specify code required).

SPECIAL FEATURES

Fan-Out (#3901): This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. This

feature may also be used to allow up to three multiplexers, or communications controllers, at a central site to share the same 3863 Modem for backup purposes. In this case, although all of the machines attached to the 3863 will receive the incoming data simultaneously, the user switch-over procedure must ensure that only one machine is sending. Limitations: Mdl 1 only. Cannot be used with DTE external clocking. Cannot be installed with LPDA Functions on Tailed Links (#4791) or with Tail Circuit Attachment accessory. In countries where the UK British Telecommunications Safety Requirements are in effect and:

- When the SNBU feature (#7953) is used, order the DLA 2 feature (#2940) for each DTE that requires a safety barrier and is attached using the fan-out feature.
- When the SNBU feature (#7953) is not used, order one DLA 1 feature (#2939) if one or more of the DTEs attaching to the fan-out feature require the safety barrier.

Field Installation: Yes.

LPDA Functions on Tailed Links (#4791): This feature enables the 3863 mdl 1 that is attached by the Tailed Circuit Attachment accessory to a channel of a 3865 Modem with Data Multiplexer (#3260) and 3863 mdl 1 that are at the other end of the line to respond to LPDA commands. Required only on the 3863 attached to the 3865. Limitations: Mdl 1 only. Cannot be installed with Fan-Out feature (#3901). Operates only with data line procedures SDLC (NRZ or NRZI) and BSC (EBDIC or ASCII or Transparent). Field Installation: Yes. Prerequisites: Tail Circuit Attachment accessory. See Modem Diagnostic Functions in section "Standard Features" for required program products.

Extended Diagnostic Card (#7930): This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. This feature may not function properly in some countries on a multipoint line of normal quality. A possible solution is to use a CCITT M1020 Line. Limitation: This feature is for the mdl 1 only, and must be in both the local and remote modems. Field Installation: Yes. Prerequisite: See LPDA in "Highlights" for required program products on S/370 and 4300 processors.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Available for all 3863 Modem mdl 1s (nonswitched line). Provides backup for the nonswitched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3863 Modems. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.
- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3863 tributary modem equipped with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire "switched" telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities" section. This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out, otherwise the first line is automatically dropped. Limitation: Not available on 3863 mdl 2.

In countries where the UK British Telecommunications Safety Requirements are in effect, the DLA 2 (#2940) must be used with the SNBU feature for each DTE that requires a safety barrier. Field Installation: Yes.

Direct Line Attachment (DLA) (#2939, #2940): These features apply only to countries where the UK British Telecommunications Safety Requirements are in effect. These modems meet the UK British Telecommunications Safety requirements specified for Data Communications Equipment. The required safety barrier to allow DTEs not meeting the UK Safety requirements is provided with the following DLA features. Contact IBM to identify the DTEs that require these features. Note: #2939 and #2940 provide safety barriers specifically designed for use with those IBM DTEs that do not meet the UK safety requirements. It is the customer's responsibility when using these modems and features with non-IBM DTEs to satisfy the British Telecommunications that the equipment complies with the requisite safety regulations.

DLA 1 (#2939): This feature is used with nonswitched lines without the SNBU feature (#7953) and will provide a safety barrier to all DTEs attached to the modem. Limitations: Not installed with the SNBU feature (#7953) or DLA 2 feature (#2940). Field Installation: Yes.

DLA 2 (#2940): This feature is used with switched lines, and non-switched lines with the SNBU Feature (#7953). One feature must be ordered for each DTE not meeting the UK Safety requirements that is attached to the modem. Limitations: Not installed with DLA 1 feature (#2939). Field Installation: Yes.

MODEL CONVERSIONS (NONE)**ACCESSORIES**

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19" EIA rack. The shelf, which fits racks that have an inside depth of 60cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

Tail Circuit Attachment (P/N 8547442): Allows the 3863 mdl 1 or 3864 mdl 1 to attach to a 3865 Modem mdl 1 equipped with Data Multiplexing (#3260). Permits an extension of a network via a separate set of modems and a separate communications channel. Limitations: To have the 3863s on a tailed circuit responding to LPDA commands, LPDA Functions on Tailed Links (#4791) must be installed on 3863 that is attached to the 3865. Cannot be used simultaneously with Fan-Out (#3901).

SUPPLIES (NONE)

3864 MODEM

PURPOSE

A 4800 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of network errors ... alert messages on error threshold ... formatted modem test results.

MODELS

Model 001 (No Longer Available): Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point, multipoint control, or multipoint tributary mode.

Model 002: Operates in half-duplex mode over 2-wire switched telecommunications networks. Operating mode is point-to-point.

Customer Setup: The 3864 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 1 modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches.

Note: Some changes of the setup switches may require SYSGEN changes in the program support.

(Except Canada > In countries where Customer Setup is prohibited or impractical, terms and conditions will include CE support for installation. Contact IBM to find out if Customer Setup applies. <)

HIGHLIGHTS

- Volume purchase price reductions are available for quantity purchases.
- A high density rack-mounted version of the 3864 mdl 1 is available for central teleprocessing installations. See section "Related Equipment" below and M3868 pages.

Standard Features:

- Data Rate: 4800 bps with backup of 2400 bps.
- A microprocessor for signal processing.
- Auto Answer - Automatic Answering of Switched Network calls - mdl 2 ... SNBU - mdl 1.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (4800/2400 bps) of the local modem.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or re-

mote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:

1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either "Receive Signal Level Reporting" or "LPDA Functions on Tailed Links" is needed, Version 3 (PP 5668-920) is required.
3. ACF/NCP Version 2 (PP 5735-XX1).

Note: The functions "Receive Signal Level Reporting", and "LPDA Functions on Tailed Links" are not supported by this level.

- Modem provides its own clocking or will accept DTE (external) clocking.
- Conforms to CCITT Recommendation for Switched Network for V.27ter.
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100m (328 ft) long when the modem is attached to a 3705, 3720, 3721, 3725 or 3726 Communications Controller or equivalent. See M3705, 3720, 3721, 3725, 3726 pages for details.

Optional Features: See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-wire Switched Network Backup: Provides backup for non-switched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.
- Direct Line Attachment: Provides the safety barrier required by the UK British Telecommunications for Data Terminal Equipment not meeting UK safety requirements.
- LPDA Functions on Tailed Links: Allows tailed 3864 mdl 1 to respond to LPDA diagnostic commands.

Diagnostics: Built in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 or 4300 processor or System/36 or 9370 Processor for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report Receive Signal Level, a 3864 mdl 1 must have serial number suffix code of or later. If the serial number suffix code is earlier, RPQ 8Q0318 must be installed.

To respond to LPDA commands, a 3864 tailed to a 3865 with Data Multiplexer (#3820) must have LPDA Function on Tailed Links (#4791) installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3864 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for a switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.
- Lamp test -- tests all indicator lights on the operator panel.

COMMUNICATIONS FACILITIES MDL 1

PTT Facilities: Telecommunications lines of a normal quality for data transmission can be used. See IBM for the availability of such facilities in your country.

Privately-owned Communication Facilities: Equivalent to above.

Communication Facilities Mdl 2 and Mdl 1 with Switched Network Backup (#7953)

Public Switched Network: (Canada only) Two-wire switched line with an exclusion key telephone. (<) The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

(Canada only) Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4. <)

Attachment to Facilities: (Canada only) The cables supplied to attach the 3864 mdl 2 and the 3864 mdl 1 with Switched Network Backup (#7953) to the public switched network are terminated with spade lugs for attachment to a CBS type data coupler (WE 1001A, series 5 or later, or WE 1001F or equivalent) which is provided by the telecommunications service supplier. (<) (Except Canada) The proper cable and terminating plug will be provided to each country which has customer setup. There will be a nonswitched cable, a switched cable or a nonswitched and two switched cables if Switched Network Backup (#7953) is added as a feature.

In the case of either Switched Network or Switched Network Backup, the modem includes the World Trade Public Switched Network Adapter (WT PSN Adapter) which permits direct attachment to the switched network in World Trade countries (when allowed by local PTT regulations). Contact IBM to determine whether the Switched Network modem or the Switched Network Backup feature is allowed in your country.

Note: Each modem is configured for the country for which it is ordered. Line Adapters will vary by country. (<)

(Canada only) An exclusion key telephone set (<)

(Except Canada) A telephone set (handset) (<) is required with switched facilities at locations where calls will be originated. Two telephone sets are required with 4-wire Switched Network Backup (#7953). Answer-only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3864 operates with IBM communication products capable of 4800 bps operation. See M2700 pages. The 3864 must communicate with another appropriately configured 3864 or with a 3868 mdl 2 Rack-Mounted Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the Introduction and Site Preparation Guide, GA27-3200.

The customer is also responsible for:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".
3. Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device.
4. Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.
5. Unpacking and placing of the 3864. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the "IBM 3863/3864 Setup Instructions and User's Guide", GA27-3216.
6. Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
7. Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
8. All three of the following program products must be installed for LPDA to function:

NCCF -- NPDA -- and ACF/NCP

See section "Standard Features" for required release levels.

9. (Except Canada) The 3864 mdl 2 complies with CCITT recommendations V.25 (as it pertains to answering equipment) and V.26-ter for operation over international public switched networks and is normally line compatible and suitable for transmission of data with other manufacturer's modems that comply with these recommendations. However, satisfactory transmission of data cannot be guaranteed over all international connections.

In those cases where it is necessary (PTT regulations for example) for an IBM 3864 to communicate with another manufacturer's modem, it is the customer's responsibility to ensure that the non-IBM modem:

- conforms to CCITT recommendations V.25 and V.26-ter
- uses CCITT coding method
- uses Ready For Sending delay of 200 to 275 milliseconds.

In the event of unsatisfactory transmission of data with a non-IBM modem, the customer must follow IBM problem determination procedures by connecting the 3864 to another 3864 prior to calling for service.<)

Publications: See KWIC Index, G320-1621, or specific systems bibliography.

SPECIFY

- Power (AC, 1-phase, 3-wire): 3.0m (10 ft) power cable.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #9901
220V #2813	127V #2823
230V #2821	200V #2732
240V #2801	208V #9902
	220V #2803
	240V #2831
- Specify #2998.
- The 3-digit country code is used to select a power cord and plug which meets the requirements of that country.
- Specify one of the following for power safety labels for the country of installation:

English/		Italian	#0932
French	#0935	Japanese	#0930
English	#0924	Portuguese	#0933
French	#0928	Spanish	#0931
German	#0927		

(Except Canada>If one of the above is not specified, the power safety labels will be English (#0924).<)

(Canada only>If one of the above is not specified, the power safety labels will be bilingual English/French (#0935).<)

- Language Groups:

Canadian	German	#2929
French	Japanese	#2930
English	Spanish	#2931
French		#2928

If one of the above is not specified, the language group will be in English (#2924).
- Telecommunications Cable (modem to telecommunications line connection): 7.5m (25 ft) (no specify code required).

SPECIAL FEATURES

Direct Line Attachment (DLA) (#2939, #2940): These features apply only to countries where the UK British Telecommunications Safety requirements are in effect. These modems meet the UK British Telecommunications Safety requirements specified for Data Communications Equipment. The required safety barrier to allow DTEs not meeting the UK Safety requirements is provided with the following DLA features. Contact IBM to identify the DTEs that require these features. Note: #2939 and #3940 provide safety barriers specifically designed for use with those IBM DTEs that do not meet UK safety requirements. It is the customer's responsibility when using these modems and features with non-IBM DTEs to satisfy the British Telecommunications that the equipment complies with the requisite safety regulations.

DLA 1 (#2939): This feature is used with nonswitched lines without the SNBU feature (#7953) and will provide a safety barrier to all DTEs attached to the modem. Limitations: Not installed with the SNBU feature (#7953) or DLA 2 feature (#2940). Field Installation: Yes.

DLA 2 (#2940): This feature is used with switched lines, and non-switched lines with the SNBU Feature (#7953). One feature must be ordered for each DTE not meeting the UK Safety requirements that is attached to the modem. Limitations: Not installed with DLA 1 feature (#2939). Field Installation: Yes.

Fan-Out (#3901): (Mdl 1 only) This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. This feature may also be used to allow up to three Multiplexers, or Communications Controllers, at a central site to share the same 3864 mdl 1 for backup purposes. In this case, although all of the machines attached to the 3864 will receive the incoming data simultaneously, the user switch-over procedure must ensure that only one machine is sending. Limitations: Mdl 1 only. Cannot be used with DTE external clocking. Cannot be installed with LPDA Functions on Tailed Links (#4791) or with Tail Circuit Attachment accessory. In countries where the UK British Telecommunications Safety Requirements are in effect and:

- When the SNBU feature (#7953) is used, order the DLA 2 feature (#2940) for each DTE that requires a safety barrier and is attached using the Fan-Out feature.
- When the SNBU feature (#7953) is not used, order one DLA 1 feature (#2939) if one or more of the DTEs attaching to the Fan-Out feature require the safety barrier.

Field Installation: Yes.

LPDA Functions on Tailed Links (#4791): This feature enables the 3864 mdl 1 that is attached by the Tailed Circuit Attachment accessory to a channel of a 3865 modem with Data Multiplexer (#3260) and 3864 mdl 1 that are at the other end of the line to respond to LPDA commands. Required on the 3864 attached to the 3865. Limitations: Mdl 1 only. Cannot be installed with Fan-Out (#3901). Operates only with data line procedures SDLC (NRZ or NRZI) and BSC (EBCDIC or ASCII or Transparent). Field Installation: Yes. Prerequisites: Tail Circuit Attachment accessory. See Modem Diagnostic Functions in section "Standard Features" for required program products.

Extended Diagnostic Card (#7930): (Mdl 1 only) This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. This feature may not function properly in some countries on a multipoint line of normal quality. A possible solution is to use a CCITT M1020 Line. Limitation: This feature is for the mdl 1 only, and must be in both the local and remote modems. Field Installation: Yes. Prerequisite: See LPDA in "Highlights" for required program product support.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Available for all 3864 mdl 1s (nonswitched line). Provides backup for the non-switched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3864s. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.
- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3864 tributary modem equipped

MACHINES

with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire "switched" telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities". This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out, otherwise the first line is automatically dropped. Limitation: Not available on 3864 mdl 2. In countries where the UK British Telecommunications Safety Requirements are in effect, the DLA 2 (#2940) must be used with the SNBU feature for each DTE that requires a safety barrier. Field Installation: Yes.

MODEL CONVERSIONS (NONE)**ACCESSORIES**

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19 inch EIA rack. The shelf, which fits racks that have an inside depth of 80cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

Tail Circuit Attachment (P/N 8547442): Allows the 3863 mdl 1 or 3864 mdl 1 to attach to a 3865 Modem mdl 1 equipped with Data Multiplexing (#3260). Permits an extension of a network via a separate set of modems and a separate communications channel. Limitations: To have the 3864's on a tailed circuit responding to LPDA commands, LPDA Functions on Tailed Links (#4791) must be installed on 3864 that is attached to the 3865. Cannot be used simultaneously with Fan-Out (#3901).

SUPPLIES (NONE)

3865 MODEM

PURPOSE

A 9600 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of network errors -- alert messages on error threshold -- formatted modem test results.

MODELS

Model 001: Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point mode.

Model 002: Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in multipoint mode and can be configured as a multipoint control or as a multipoint tributary station.

Limitations: The 3865 mdl 002 can be used only in a multipoint network. A multipoint network can be implemented with only one tributary. Additional stations can be added as the network expands. The 3865 mdl 002 cannot be used in a point-to-point mode, like a 3865 mdl 001. Neither can a 3865 mdl 001 be used in a multipoint network, like a 3865 mdl 002. Model conversion is not possible. See "Network Configuration" in "IBM 3863, 3864 and 3865 Modems Introduction and Site Preparation Guide", GA27-3200.

Customer Setup: The 3865 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 002 modem may be configured for multipoint control or multipoint tributary operation with the setup switches. Note: Some changes of the setup switches may require SYSGEN changes in the program support.

(Except Canada > In countries where Customer Setup is prohibited or impractical, terms and conditions will include CE support for installation. Contact IBM to find out if Customer Setup applies. <)

HIGHLIGHTS

- Volume purchase price reductions are available for quantity purchases. See Z125-3260 and Z120-3257 for details.
- A high density rack-mounted version of the 3865 mdl 001 and 002 is available for central teleprocessing installations. See section "Related Equipment" below and M3868 pages.

Standard Features:

- Data Rate: 9600 bps with backup of 4800 bps.
- Auto Answer: Automatic answering of switched network calls with Switched Network Backup.
- A microprocessor for signal processing.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (9600/4800 bps) of the local modem (primary status). The network configuration of the remote modem must be secondary.
- Anti-Streaming: A multipoint tributary modem (mdl 002) can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.

- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:

1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either Receive Signal Level Reporting or LPDA Functions on multiplexed links is needed, Version 3 (PP 5668-920) is required.
3. ACF/NCP Version 2 (PP 5735-XX1). Note: The functions Receive Signal Level Reporting, and LPDA Functions on multiplexed links are not supported by this level.

- Modem provides its own clocking or will accept DTE (external) clocking.
- Fast RFS: 24 millisecond Ready for Sending (RFS) Delay available for 3865 multipoint tributary modems. Customer switch option (24ms or 60ms).
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100 meters (328 ft.) long when the modem is attached to an 3705, 3720, 3721, 3725, or 3726 Communications Controller or equivalent. See M3705, 3720, 3721, 3725, 3726 pages for details.

Optional Features: See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-wire Switched Network Backup: Provides backup for non-switched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.
- Direct Line Attachment: Provides the safety barrier required by the UK British Telecommunications for Data Terminal Equipment not meeting UK safety requirements.

Diagnostics: Built in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370, 4300 processor, System/36, or 9370 processor for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report Receive Signal Level, a 3865 must have serial number suffix code of GM or later. If the serial number suffix code is earlier, RPQ 8Q0319 must be installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Prob-

able cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3865 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.
- Lamp test -- tests all indicator lights on the operator panel.

Communication Facilities

PTT Facilities: 3865 Modems mdl 001 and mdl 002 require CCITT M1020 channels.

Note: In some countries, lower cost facilities can be used.

On 3865 mdl 2, the short (24 millisecond) Ready for Sending Delay may be used.

Privately-owned Communication Facilities: Equivalent to above.

MDL 001 OR MDL 002 WITH SWITCHED NETWORK BACKUP (#7953)

Public Switched Networks: (Canada only> 2-wire switched line with an exclusion key telephone set.<) (Except Canada> The characteristics of the switched line are those of the public switched network as described by the PTT in each country.<) The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

(Canada only> Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4.<)

Attachment to Facilities: (Canada only> The cables supplied to attach the 3865 with 4-wire Switched Network Backup (#7953) to the public switched network are terminated with spade lugs for attachment to a CBS type data coupler (WE 1001A, series 5 or later, or WE 1001F or equivalent) which is provided by the telecommunications service supplier.<) (Except Canada> The proper cable and terminating plug will be provided to each country which has customer setup. There will be a nonswitched cable, a switched cable or a

nonswitched and two switched cables if Switched Network Backup (#7953) is added as a feature.

When equipped with the 4-wire SNBU feature (#7953), the modem includes the World Trade Public Switched Network Adapter (WT PSN Adapter) which permits direct attachment to the switched network in World Trade countries (when allowed by local PTT regulations). Contact IBM to verify that the SNBU feature is allowed in your country.

Note: Each modem is configured for the country for which it is ordered. Line Adapters will vary by country.<)

(Canada only> An exclusion key telephone set<) (Except Canada> A telephone set (handset)<) is required with switched facilities at locations where calls will be originated. (Two telephone sets are required with 4-wire Switched Network Backup (#7953).) Answer-only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3865 operates with IBM communication products capable of 9600 bps operation. See M2700 pages. The 3865 must communicate with another appropriately configured 3865 or with a 3868 mdl 003 or 004 Rack-Mounted Modem unless multiplexing is used. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the "Introduction and Site Preparation Guide", (GA27-3200).

The customer is also responsible for:

- Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
- Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".
- Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device.
- Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.
- Unpacking and placing of the 3865. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the "IBM 3865 Setup Instructions and User's Guide", GA27-3218.
- Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
- Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
- All three of the following program products must be installed for LPDA to function.

NCCF -- NPDA -- and ACF/NCP.

See section "Standard Features" above for required release levels.

Bibliography: See KWIC Index, G320-1621, or specific systems bibliography.

SPECIFY

- Power (AC, 1-phase, 3-wire): 3.0 meter (10 ft.) power cable.

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #9901
220V #2813	127V #2823
230V #2821	200V #2732
240V #2801	208V #9902
	220V #2803
	240V #2831

- Specify #2998.
- The 3-digit country code is used to select a power cord and plug which meets the requirements of that country.
- Specify one of the following for power safety labels for the country of installation:

English/		
French #0935	Italian	#0932
English #0924	Japanese	#0930
French #0928	Portuguese	#0933
German #0927	Spanish	#0931

(Except Canada>If one of the above is not specified, the power safety labels will be English (#0924).<)

(Canada only>If one of the above is not specified, the power safety labels will be bilingual English/French (#0935).<)

- Language Groups:

Canadian/		
French #2935	German	#2929
English #2924	Japanese	#2930
French #2928	Spanish	#2931

If one of the above is not specified, the language group will be in English (#2924).

- Telecommunications Cable (modem to telecommunications line connection): 7.5m (25 ft) (no specify code required).

SPECIAL FEATURES

Data Multiplexer (#3260): This feature allows selection of a 4800 bps and 2400 bps subchannel. The modem multiplexes subchannel data into a single aggregate data stream -- this feature offers four channel configurations. When the 3865 is placed in half-speed mode, the aggregate data stream is transmitted at half speed and as a result the channel configurations will be automatically altered because of lower speed. Channel configurations are:

Full-Speed Operation Channels

A	B	C	D
9600	-	-	-
4800	4800	-	-
4800	2400	2400	-
2400	2400	2400	2400

Half-Speed Operation Channels

A	B	C	D
4800	-	-	-
4800	-	-	-
4800	-	-	-
2400	2400	-	-

All data sources are connected to the 3865 mdl 001 by separate EIA/CCITT interfaces. Multiplexer channels will permit attachment

to co-located terminals or tailed circuit extensions for network flexibility and cost savings. Tail circuit extensions allow co-located 3863 or 3864 modems equipped with the Tailed Circuit Attachment accessory to be attached to a 3865 channel. Modems so attached can extend the channel data path by its attached communications line and a second (remotely attached) modem. Each multiplexer channel is equipped with buffers to compensate for timing variations between tailed modems and the 3865 clocks. Limitations: Mdl 001 only. Cannot be installed with Fan-Out feature (#3901). Tailed 3863 or 3864 modems must be mdl 001 only, multipoint control mode only, set for external clocking. LPDA diagnostic commands to a Data Multiplexed Link are received only on Channel A of the 3865 with Data Multiplexer feature attached to the host DTE. In order for this 3865 to respond to LPDA commands, it must have serial number suffix code of DG or later. If the serial number suffix code is earlier, MES #323406 must be installed. In countries where the UK British Telecommunications Safety Requirements are in effect and:

- When the SNBU feature (#7953) is used, order the DLA 2 feature (#2940) for each DTE that requires a safety barrier and is attached using the data multiplexer feature.
- When the SNBU feature (#7953) is not used, order one DLA 1 feature (#2939) if one or more of the DTEs attaching to the data multiplexer feature require the safety barrier.

Field Installation: Yes.

Fan-Out (#3901): This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used as a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. This feature may also be used to allow up to three Multiplexers, or Communications Controllers, at a central site to share the same 3865 for backup purposes. In this case, although all of the machines attached to the 3865 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. Limitations: Cannot be installed with DTE external clock, or Data Multiplexer (#3260). In countries where the UK British Telecommunications Safety Requirements are in effect and:

- When the SNBU feature (#7953) is used, order the DLA 2 feature (#2940) for each DTE that requires a safety barrier and is attached using the data multiplexer feature.
- When the SNBU feature (#7953) is not used, order one DLA 1 feature (#2939) if one or more of the DTEs attaching to the data multiplexer feature require the safety barrier.

Field Installation: Yes.

Extended Diagnostic Card (#7930): This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. This feature may not function properly in some countries on a multipoint line of normal quality. A possible solution is to use a CCITT M1020 Line. Limitation: This feature must be in both the local and remote modems. Field Installation: Yes. Prerequisite: See LPDA in "Highlights" for required program product support.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Provides backup for the nonswitched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3865s. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the

control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.

- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3865 tributary modem equipped with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire switched telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities" section. This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out; otherwise the first line is automatically dropped. Limitations: It may be necessary to re-dial or change to half speed to maintain acceptable performance in SNBU mode. See "Customer Responsibilities" in the M2700 pages for details. In countries where the UK British Telecommunications Safety Requirements are in effect, the DLA 2 (#2940) must be used with the SNBU feature for each DTE that requires a safety barrier. Field Installation: Yes.

Direct Line Attachment (DLA) (#2939, #2940): These features apply only to countries where the UK British Telecommunications Safety requirements are in effect. These modems meet the UK British Telecommunications Safety requirements specified for Data Communications Equipment. The required safety barrier to allow DTEs not meeting the UK Safety requirements is provided with the following DLA features. Contact IBM to identify the DTEs that require these features. Note: #2939 and #2940 provide safety barriers specifically designed for use with those IBM DTEs that do not meet

UK safety requirements. It is the customer's responsibility when using these modems and features with non-IBM DTEs to satisfy the British Telecommunications that the equipment complies with the requisite safety regulations.

DLA 1 (#2939): This feature is used with nonswitched lines without the SNBU feature (#7953) and will provide a safety barrier to all DTEs attached to the modem. Limitations: Not installed with the SNBU feature (#7953) or DLA 2 feature (#2940). Field Installation: Yes.

DLA 2 (#2940): This feature is used with switched lines, and non-switched lines with the SNBU Feature (#7953). One feature must be ordered for each DTE not meeting the UK Safety requirements that is attached to the modem. Limitations: Not installed with DLA 1 feature (#2939). Field Installation: Yes.

MODEL CONVERSIONS (NONE)

ACCESSORIES

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19" EIA rack. The shelf, which fits racks that have an inside depth of 60cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

SUPPLIES (NONE)

3866 MULTIMODEM ENCLOSURE

PURPOSE

The 3866 models 1 and 2 are multimodem enclosure. Model 1 can be mounted in a standard commercially available 19-inch rack cabinet and model 2 comes mounted in a mini cabinet for one enclosure only. These enclosures provide housing, cooling and power for the 3868 models 1 to 4 rack-mounted modems.

MODELS

Model 1 001: Multimodem Enclosure for installation in commercial standard 19-inch rack cabinet.

Model 2 002: Multimodem Enclosure with single enclosure cabinet.

Customer Set-Up (CSU): The 3866 multimodem enclosures and associated power and fan units are designated to be set up by the user thereby offering the customer availability and relocation flexibility.

HIGHLIGHTS

The 3866 mdl 1 and 2 are multimodem enclosures providing housing, powering and cooling for 3868 mdls 1 to 4 modem packs. Up to 12 single-width modem packs (3868 mdl 1) or up to six double-width modem packs (3868 mdl 2, 3 and 4) or six 5868 Rack Mounted Modems can be housed in an enclosure.

The 3866 mdl 1 multimodem enclosure must be installed in a standard 19-inch wide by 24-inch deep rack cabinet to be provided by the customer. Standard cabinets are available to accommodate several enclosures and mandatory fan units. Up to six enclosures and three mandatory fan units can be housed in a six foot high cabinet.

The 3866 mdl 2 multimodem enclosure is already mounted in an IBM provided mini cabinet.

For both mdls, a power unit and a fan unit must be ordered with each enclosure. In cabinet for multi enclosures only one fan unit is necessary per two enclosures (see "Special Features"). The customer may wish to replace a failing power unit with a spare and should be advised to order sufficient spare units.

Optional Features: See "Special Features" for detailed description.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate hardware ordering including Commercial Cabinet, where required, site preparation and setting up. For more information, refer to the "Planning and Site Preparation Guide" (GA33-0023).
- Receipt at the customer's receiving dock, unpacking and setting up the cabinet, enclosure, power and fan units.
- Performing 3866 check-out in accordance with supplied procedures for initial set up and relocation.
- Using customer problem determination procedures provided with the 3866 to determine the failing unit and filling out the appropriate 3866 problem report prior to (Canada only> taking action to get the failing unit exchanged<) (Except Canada> requesting maintenance service<) (See "Maintenance" below).
- Procuring any required spares.

(Canada only> Warranty Service: The warranty period is three years. Warranty service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amend-

ment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) as described below.

Customer On-Site Exchange (COE): It is the customer's responsibility to set up the equipment and to determine when maintenance is required. The customer may wish to replace a failing element with a spare element and should be advised to purchase sufficient spare elements.

It is the customer's responsibility to disconnect the element(s) and call a designated number to have a replacement element(s) delivered to the customer site where they will be exchanged (without testing) for the customer's defective unit(s). The defective elements become the property of IBM.

The 3866 will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The service offering after warranty will be Customer On-Site Exchange (COE).

Maintenance: The level of maintenance service on a rental (MRC) machine is Customer On-Site Exchange (COE). Maintenance service is provided under the Amendment for IBM Service/Exchange Center services.

On-Site Assistance: If the customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR), he may call for assistance on a toll free number. IBM will respond to the customer site to aid the customer in performing CPAR procedures using the same documentation available to the customer. IBM assistance is billable at the application rates and terms.<)

(Except Canada> Maintenance: Maintenance of 3866s is available under the IBM Maintenance agreement for on-site maintenance. It is the customer's responsibility to set up the equipment and to determine when maintenance is required.

On-site maintenance is provided during the warranty period.

Repair of the 3866 and its features will require the availability of the 3866 to the Customer Engineer. If the customer has restored service with the use of spare elements, it will be necessary for the customer to turn the 3866 over to the CE.

Customers with 3866s not covered by IBM Maintenance Agreement may have the unit(s) repaired (if the unit is repairable) for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement Coverage, he may have the machine(s) inspected.

If, on the basis of the inspection, it is concluded that the state of the machine precludes normal maintenance, the machine is returned to the customer without charge subject to a minimum charge for the inspection.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.<)

RPQs: (Canada only>RPQs will not be accepted.<) (Except Canada> RPQs will be accepted immediately. Processing will begin in 90 days. Response time depends upon complexity.<)

SPECIFY

- (Canada only>Voltage (120V AC, 1-phase, 3-wire, 60 Hz): Specify #9891 for 3.0m (10 ft.) power cable, or #9886 for 1.8m (6 ft.) power cable or #9491 for 0.75m (2.5 ft.) special

rack-installation power cable. If one of the above is not specified, #9891 will be assigned. <)

-
- (Except Canada > Power (AC, 1-phase, 3-wire, 50/60 Hz):
100 - 127V #2804
200 - 240V #2806
- Specify #2998. <)
- (Except Canada > Power cable: Specify #9891 for 3.0m (10 ft.) power cable or #9491 for 0.75m (2.5 ft.) special rack-installation power cable. If one of the above is not specified, #9891 will be assigned. <)
- The 3-digit country code is used to select a power cord and plug which meets the requirements of that country.
- Language Group:
English #2924 Japanese #2930
French #2928 Spanish #2931
If one of the above is not specified, the language group will be in English (#2924).

SPECIAL FEATURES

Fan Unit (#3950): Provides cooling for modem enclosure. The Fan Unit is installed in the rack cabinet above the modem enclosures.

Minimum: One Fan Unit is required for a single 3866 mdl 1 modem enclosure or for a 3866 mdl 2 modem enclosure. Only one Fan Unit is required for two 3866 mdl 1 modem enclosures installed one above the other. Field Installation: Yes. (Except Canada > When ordering this feature for field installation, the specify code for Power must be indicated in the MES order (refer to the "Specify" section). <)

Power Unit (#5210): Provides power for the modem packs installed in the modem enclosure. Minimum: One per modem enclosure 3866 mdl 1 or 3866 mdl 2. Field Installation: Yes. (Except Canada > When ordering this feature for field installation, the specify codes for Power and Language must be indicated in the MES order (refer to the "Specify" section). <)

Field Installation: Yes.

MODEL CONVERSIONS (NONE)**ACCESSORIES (NONE)****SUPPLIES (NONE)**

3868 RACK-MOUNTED MODEM

PURPOSE

The 3868 modem packs are rack-mounted versions of the 3863, 3864 and 3865 modem family to be inserted in a 3866 multi-modem enclosure. Offering in a minimum volume, the maximum density of modems housing facility, they enhance the user capability for easy installation, maintenance and expansion of a user telecommunication network.

MODELS

Model 001 (No Longer Available): 2400 bps modem pack operating in half- or full-duplex data mode over 4-wire, nonswitched duplex telecommunication facility at speeds of 2400/1200 bps. It operates in point-to-point or multipoint mode.

Model 002 (No Longer Available): 4800 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 4800/2400 bps. It operates in point-to-point or multipoint mode.

Model 003: 9600 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 9600/4800 bps. It operates in point-to-point mode.

Model 004: 9600 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 9600/4800 bps. It operates in multipoint mode and can be configured as a multipoint control or as a multipoint tributary station.

Prerequisites: A 3866 mdl 1 or 2 with available modem pack slots.

HIGHLIGHTS

- The 3868 modem packs have the same functional characteristics as the equivalent 3863, 3864 and 3865 stand-alone modems. The following table gives the list of modem packs and equivalent stand-alone modems:

Modem Pack	Description	Equivalent Stand-alone Modem
3868-1	2400 bps leased	3863-1 with extended diagnostic feature
3868-2	4800 bps leased	3864-1 with extended diagnostic feature
3868-3	9600 bps pt-to-pt	3865-1 with extended diagnostic feature
3868-4	9600 bps multipt	3865-2 with extended diagnostic feature

The following list of functions already available with the 3863, 3864 and 3865 stand-alone modems are included in the 3868 mdls 001 to 004 modem packs:

- Data rate:

- 2400 bps with back-up of 1200 bps on mdl 1
- 4800 bps with back-up of 2400 bps on mdl 2
- 9600 bps with back-up of 4800 bps on mdls 3 and 4

- Operation on 4-wire nonswitched duplex communication facility.
- A microprocessor for signal processing.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed of the local modem (primary status). The network configuration of the remote modem must be secondary.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic function referred to as Link Problem Determination Aid (LPDA), operates with Systems Network Architecture (SNA) and associated program products. (Except Canada > (LPDA functions are not supported with V.26bis.) <) Under control of these programs, the modem accepts commands and initiates status retrieval and tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of a network problem. These program products are:

Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).

Network Problem Determination Application (NPDA) Version 2 (PP 5668-983) or Version 3 (PP 5668-920 MVS/370, MVS/VA) (PP 5666-925 DOS/VSE, SSX/VSE).

ACF/NCP Version 1 Release 2.1 or Release 3 (PP 5735-XX1) or ACF/NCP Version 2 (PP 5735-XX9). Receive Signal Level Reporting is not supported by these versions.

- Modem pack provides its own clocking or will accept DTE (external) clocking.
- Fast (RFS) Ready for sending delay available for multipoint tributary modem (customer switch option).

Note: If a function is not listed herein, it is not available on the 3868 modem packs.

Diagnostics: Built-in diagnostics: All modems will respond to diagnostic commands from the system. Test requests and responses utilize the same data path and controls that are used by the S/370, System/36, S/8100, (DPPX/SP), 4300 processor or 9370 processor for data transmission. Thus, diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interfaces or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results and status data including receive signal level.

In addition, tests can also be executed from the modem operator panel. These manual tests include:

MACHINES

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a "wrap" or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance.
- Lamp test -- tests all indicator lights on the operator panel.

Customer Set Up (CSU): The 3868 Rack-Mounted modems are designated to be set up by the user there by offering the customer availability and relocation flexibility.

(Except Canada > In countries where CSU is prohibited or impractical, terms and conditions will include CE support for installation. Contact IBM to find out if CSU applies.<)

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate hardware ordering including Commercial Cabinet, Site preparation and setting up. For more information, refer to the "Planning and Site Preparation Guide", GA33-0023.
- Arrangements for the price quotations, installation, and all costs of common carrier equipment and service.
- Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel.
- Ensuring the availability of the interconnecting cable between the business machine and the modem because it is not supplied by the modem.
- Receipt at the customer's receiving dock, unpacking and setting up the packs.
- Performing 3868 check-out in accordance with supplied procedures for initial setup and relocation.
- Using customer problem determination procedures provided with the 3866 to determine the failing unit and filling out the appropriate 3868 problem report prior to (Canada only> taking action to get the failing unit repaired or exchanged.<) (Except Canada> requesting maintenance service.<) (See "Maintenance" below.)
- Procuring any required spare packs. The customer may wish to replace a failing 3868 with a spare and must be informed to retain sufficient spare units for such use. The number of spare units recommended is dependent upon the number units the customer has installed, the operational requirements, physical locations, and layouts. However, the minimum number of spare units recommended is shown in the following table:

Number of 3868s Installed	Minimum Number of Spares Recommended
001-100	3
001-200	4
201-300	6
301-500	8
501-1000	14
1001-1500	19
1500-2000	24

- Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.

- Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
- All three of the following program products must be installed for LPDA to function:

NCCF Version 1 Release 2 (PP 5735-XX6)
NPDA Version 2 (PP 5668-983) or Version 3 (PP 5668-920, PP5666-925)
ACF/NCP Version 1 Release 2.1 or Release 3 (PP 5735-XX1) or ACF/NCP Version 2 (PP 5735-XX9)

(Canada only > Warranty Service: The warranty period is three years. Warranty Service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amendment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) as described below.

Customer On-Site Exchange (COE): It is the customer's responsibility to set up the equipment and to determine when maintenance is required. The customer may wish to replace a failing element with a spare element and should be advised to purchase sufficient spare elements.

It is the customer's responsibility to disconnect the element(s) and call a designated number to have a replacement element(s) delivered to the customer site where they will be exchanged (without testing) for the customer's defective unit(s). The defective elements become the property of IBM.

The 3868 will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The maintenance offering will be Customer On-Site Exchange (COE).

Maintenance: The level of maintenance service on rental (MRC) machines is Customer On-Site Exchange (COE). Maintenance service is provided under the Amendment for IBM Service/Exchange Center services.

On-Site Assistance: If the customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR), he may call for assistance on a toll free number. IBM will respond to the customer site to aid the customer in performing CPAR procedures using the same documentation available to the customer. IBM assistance is billable at the application rates and terms.<)

(Except Canada > Maintenance: Maintenance of 3868s is available under IBM Maintenance agreement for on-site maintenance. It is the customer's responsibility to install the equipment and to determine when maintenance is required.

The 3868 modem packs are made for easy insertion and removal in a 3866 Enclosure. This capability will allow for customers to determine if a modem pack is failing and to quickly restore service by the replacement of a questionable modem pack by a spare. Customers wishing to avail themselves of this capability should plan to obtain spare modem packs for this purpose.

Repair of the 3868 modem packs will require the availability of the 3868 link to the CE. If the customer has restored service with the use of a spare modem pack, it will still be necessary for the customer to turn a 3868 link over to the CE for the purposes of problem verification, determination, and repair verification.

On-site maintenance is provided during the warranty period.

Customers with 3868s not covered by IBM Maintenance Agreement may have the unit(s) repaired (if the unit is repairable) for a time and material charge.

If maintenance coverage is not contracted for immediately following the expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement coverage, he may have the machine(s) inspected.

If, on the basis of the inspection, it is concluded that the state of the machine precludes normal maintenance, the machine is returned to the customer subject to a minimum charge for the inspection.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage. <

interconnecting cable between the business machine and the modem must be supplied by the business machine.

Bibliography: See specific systems bibliography.

RPQs: (Canada only) > RPQs will not be accepted. <

COMMUNICATIONS FACILITIES - MDLS 1 AND 2

PTT Facilities: Telecommunications lines of a normal quality for data transmission can be used. See IBM for the availability of such facilities in your country.

Privately-owned Communication Facilities: Equivalent to above.

COMMUNICATIONS FACILITIES - MDLS 3 AND 4

PTT Facilities: 3868 Modems mdl 3 and mdl 4 require CCITT M1020 channels. Note: In some countries, lower cost facilities can be used.

On 3868 mdl 4, the short (24 millisecond) Ready for Sending Delay may be used.

Privately-owned Communication Facilities: Equivalent to above.

Extended Diagnostic Functions: Provided with 3868 mdls 1 to 4, these functions enhance the diagnostic capabilities of non-switched modems when it is installed in both the local and remote modems. It provides an additional test that enables NPDA to differentiate between modem failure, line failure and remote modem power loss. These functions may not work properly in some countries on a multipoint line of normal quality. A possible solution is to use a CCITT M1020 line.

Related Equipment: The 3868 operates with IBM communication products capable of 2400 bps operation for mdl 1, 4800 bps operation for mdl 2 and mdl 2 and 9600 bps operation for mdls 3 and 4. See M2700 pages. The 3868 communicates with another appropriately configured 3868 or 3863/3864/3865 stand-alone modem. The

SPECIFY

- Telecommunication cable (modem to telecommunications line connection):

7.5m (25 ft) Standard connector terminated #9713 0.7m (2.5 ft) Unterminated (no plug), for custom installation #9719

If one of the above is not specified, #9713 will be assigned.

The 3-digit country code is used to select a telephone cord and plug which meets the requirements of that country.

- Language Groups:

English #2924	Japanese #2930
French #2928	Spanish #2931

If one of the above is not specified, the language group will be in English (#2924).

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

MACHINES

3872 MODEM
PURPOSE

A 2400 bps modem, with half-speed capability, used to provide communications products with the means for transmitting data over nonswitched lines.

MODELS

Model 1 001

Prerequisites: See "Teleprocessing Systems" in GI Section 3 and the M2700 pages, for facilities description and attached machine configurations. Consult your country TP Coordinator to determine approval status and PTT requirements.

HIGHLIGHTS

Modem operation is possible in half-duplex mode over 2- or 4-wire half-duplex facilities, half-duplex or duplex mode over 4-wire duplex facilities, or half-duplex mode over switched telecommunication networks.

Data Rates: 2400 bps with backup half-speed.

Equalization: Manually adjustable by operator.

Operation: Multipoint control, multipoint tributary or point-to-point. See "Special Features".

Built-In Diagnostics: Included in each modem are the following diagnostic features accessible to the operator: (1) The modem may be *wrap tested* independently of the using machine and telecommunication channel ... (2) It may be *line tested* with a remote modem and telecommunication channel, independently of the attached business machine. The test may be one-way or remotely wrapped to the local modem.

Communication Facilities

PTT Nonswitched Lines: Telecommunication lines of a normal quality for data transmission can be used. See your country TP Coordinator for the availability of such facilities. Also see the *IBM 3872 User's Guide*, GA27-3058.

Privately Owned Communications Facilities: Equivalent to above.

International Facilities: Request your country TP Coordinator to contact the coordinator in other countries involved to determine the availability of the required telecommunication lines.

Attachment to Facilities: Attachment to telecommunication lines is by means of a cable provided with the 3872.

Related Equipment: The 3872 operates with IBM communications products capable of 2400 bps operation ... see "Related Equipment" under "Specify". Modem clocking must be used. The 3872 Modem must communicate with another appropriately equipped 3872, or with an appropriately equipped IBM 2400 bps Integrated Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages and in the Installation Planning section of the *3872 User's Guide*, GA27-3058. The customer is responsible for:

1. Arrangements for price quotations, installation and all costs of common carrier equipment and services.
2. Furnishing adequate telecommunication lines in accordance with the communication facilities noted above and with proper operating levels and characteristics. Refer to "Customer Responsibilities" in the M2700 pages and in the Installation Planning section of the *3872 User's Guide*, GA27-3058.
3. Providing voice communication between modems to coordinate tests or re-equalization. The voice facility can be provided by the 3872 Alternate Voice feature. Information concerning the handset for the Alternate Voice feature is described in the *3872 Modem User's Guide*. The voice facility must be located such that an operator can use it while operating the controls on the front of the modem.
4. If the 3872 is to be attached to a non-IBM product, the interconnecting cable between the business machine and the modem must be supplied by the business machine.

Publications: GA27-3089 ... *IBM Speed Modem Digest*, GA27-3059 ... *IBM 3872 User's Guide*, GA27-3058

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	115V #9901

235V #2814	230V #9904

- Language Groups: #2927 for English, #2928 for French, #2929 for German.

- Power Cord: #2710 for World Trade Standard; #2711 for UK type; #2906 for 60 Hz or, for Japan, 50 Hz.

- Telecommunication Cord (modem to telecommunication facility): Specify one of the following for each telecommunication channel or network connection:

#2775 - cable for single modem or for first modem in a double unit; #2943 for NTT D1 line with PD1A, Japan. #2776 - cable for second modem in a double unit; #2944 for NTT D1 line with PD1A, Japan. Do not specify #2776 or #2944 for a single modem.

A 10-foot cable will be supplied. If a longer cable is required, indicate 15, 20 or 25 feet as the quantity of the feature number specified.

- Related Equipment: For record purposes, one 3872 Attachment Feature Code from the table below must be specified for each 3872, depending upon the unit to which it is attached.

The Following Table Has Been Revised:

Machine	3872 Attach #	Machine	3872 Attach #

SPECIAL FEATURES

The basic 3872 Modem, with no additional features required, is used at the control station in a centralized multipoint network. Specify: Telecommunication Cord #2775 or #2943 (for Japan). Additional capabilities/configurations are provided by the following features:

Alternate Voice (#1051, #1052): Provides signalling capability and a socket on the operator panel into which a customer-provided handset may be plugged, permitting voice communications with the distant 3872 Modem(s). Data cannot be simultaneously transmitted with

MACHINES

3872 Modem (cont'd)

voice. A handset is not provided. See *3872 User's Guide* for description of handset. #1051 -- for basic modem ... #1052 -- for Second Modem (#6302). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #1052 requires #6302.

Direct Line Attachment (#2939, #2940): Available in some countries to meet PTT specifications to have the 3872 homologated. Consult your TP Coordinator to determine if it is required. #2939 -- for basic modem ... #2940 -- for second modem (#6302). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #6302 for #2940.

Fan-Out (#3901): This feature allows attachment, to the 3872, of up to three IBM Teleprocessing machines at one location ... see "Related Equipment" under "Specify" for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified IBM terminals without any additional user involvement. This feature may also be used to allow up to three of the specified IBM multiplexers, communications controllers, integrated communications adapters or communications adapters on 4331, at a central site, to share the same 3872 Modem for backup purposes. In this case, although all of the machines attached to the 3872 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. **Limitations:** Cannot be installed with Second Modem (#6302) or . **Maximum:** One. **Field Installation:** Yes.

Multipoint Tributary (#5101, #5102): Used on each modem attached to tributary stations in a centralized multipoint network to compensate for line distortion between the control and tributary station. Operator adjustment on front panel. #5101 -- for basic modem ... #5102 -- for Second Modem (#6302). **Limitations:** #5101 cannot be installed with Point-to-Point (#6101) ... #5102 cannot be installed with Point-to-Point (#6102). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #5102 requires #6302.

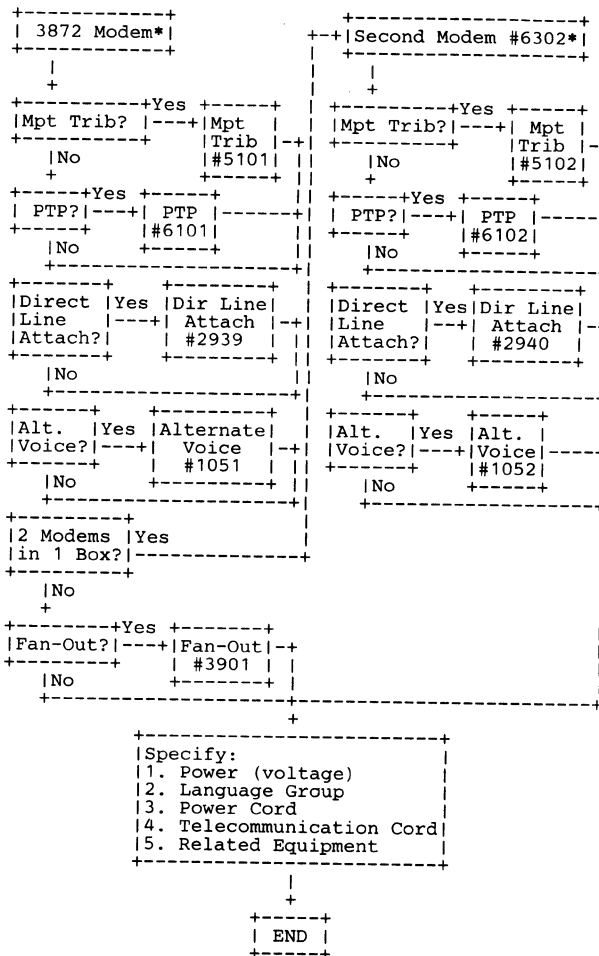

Point-to-Point (#6101, #6102): Used on modems at each end of a point-to-point private line (nonswitched) channel to compensate for line distortion. #6101 -- for basic modem ... #6102 -- for Second Modem (#6302). **Limitations:** #6101 cannot be installed with Multipoint Tributary (#5101) ... #6102 cannot be installed with Multipoint Tributary (#5102). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #6102 requires #6302.

Second Modem (#6302): Permits two modems, each to operate on a separate line, to be housed in the same stand-alone cabinet. The two modems share the same power supply. **Limitations:** Only the following features are allowed on either or both modems -- Alternate Voice (#1051, #1052), Direct Line Attachment (#2939, #2940), Point-to-Point (#6101, #6102), Multipoint Tributary (#5101, #5102). **Maximum:** One. **Field Installation:** No. **Specify:** Telecommunication Cord #2776 or #2944 (for Japan).

CONFIGURATOR

The HONE Configurator, CFMODEM, is available for assistance in configuring the 3872 Modem. The following Configurator Diagram should be used in locations where the HONE Configurator is not available.

3880 STORAGE CONTROL MODELS 1, 2, 3

THERE IS MORE THAN ONE TEXT VERSION FOR THIS PRODUCT

PURPOSE

Provides two independent control unit paths, called storage directors, for 3330/3333, 3340/3344, 3350, 3370, 3375 and 3380 direct access storage.

MODELS

Model 1 001: Each of the two storage directors provides for attachment of either up to four 3340 model A2s, or up to four 3370 model A1s and/or A2s in any combination, or up to four 3375 model A1s and/or D1s, or up to four 3333s (any model) and 3350 A2/A2Fs and C2/C2Fs in any combination (see DASD Attachment Configuration under "Specify" and M3330, 3333, 3340, 3344, 3350, 3370, and 3375 pages).

Model 2 002 (No Longer Available): One of the two storage directors provides for DASD attachment as described for both storage directors of the model 1 above. The other storage director provides for attachment of either up to two 3380 model A4s or two 3380 model AA4s (see M3380 pages).

Model 3 003: Each of the two storage directors provides for attachment of up to two 3380 model A4s or up to two 3380 model AA4s or AD4s or AE4s or any combination of AA4s, AD4s or AE4s limited to two, or with feature #3005 any combination of AD4, AE4, AJ4, or AK4 limited to two. (See M3380 pages).

Limitations:

1. See M3330, 3333, 3340, 3344, 3350, 3370, 3375, 3380 pages for system support limitations.
2. 3350 DASD attached to the 3880 must be in Native Mode format; 3330 models 1 and 11 Compatibility Mode are NOT supported.
3. In S/370 Model 135, 135-3, 138, when a 3880 is attached to a block multiplexer channel, only 16 logical devices will operate in this mode, even if more than 16 logical devices are attached.
4. Models of 3380 DASD with dynamic path selection (models AA4, AD4 and AE4) may not be attached to the same storage director as models of 3380 without dynamic path selection (model A4).
5. On a 4361 or 4381 Processor, a 3.0Mb/sec. block multiplexer channel must be used to attach 3380 DASD on a 3880 model 2 or 3 storage director, even if that storage director has the Speed Matching Buffer for 3380 feature #6550 installed.

Maximum Configuration: For configurations attaching 3340/3344 DASD, the storage director uses 64 contiguous addresses irrespective of the number of drives attached. The 3340 model A2s on the first and third strings may attach up to three 3340 model B1s/B2s and/or 3344s in any combination. The 3340 model A2 on the second string may attach up to three 3340 model B1s/B2s. The 3340 model A2 in the fourth string may attach one 3340 model B1/B2.

For a storage director attaching 3370 DASD, a maximum of four 3370 models A1 and A2 in any combination, each with up to three 3370 model B1s or B2s in any combination may be attached.

For a storage director attaching 3330/3333/3350 DASD, a maximum of four 3333 model 1s, 3333 model 11s, and/or 3350 models A2s/A2Fs in any combination. Each string with a 3333 model 1 or 11 may attach up to three 3330 models 1s/2s or 11s. Each string with a 3350 model A2/A2F may attach up to three 3350 models B2s/B2Fs or up to two 3350 models B2s/B2Fs and a 3350 model C2/C2F.

For a storage director attaching 3380 DASD, a maximum of two A4s or two AA4s, or two AD4s, or two AE4s, or a maximum of two in combination of AA4, AD4 or AE4, or with feature #3005 a maximum of two in any combination of AD4, AE4, AJ4, or AK4. Each string with a 3380 model A4/ AA4 may attach up to three 3380 model B4s. Each string with a 3380 model AD4 may attach up to three 3380 model BD4s or BE4s in any combination. Each String with a 3380 model AE4 may attach up to three 3380 model BD4s or BE4s in any combination. Each String with a 3380 model AJ4 may attach up to three 3380 model BJ4s or BK4s in any combination. Each String with a 3380 model AK4 may attach up to three 3380 model BJ4s or BK4s in any combination.

For a storage director attaching 3375 DASD, a maximum of four 3375 model A1s and/or D1s.

Prerequisites: An available control unit position for each storage director on a block multiplexer channel. One unshared subchannel for each logical address attached to a block multiplexer channel.

3880 models 2 and/or 3 storage directors attaching 3380 model A4/ AA4 DASD must be attached to either a 3.0Mb/sec. block multiplexer channel which can operate in data streaming mode or must have the Speed Matching Buffer for 3380 feature (#6550). 3880 model 3 storage directors attaching 3380 models AD4 or AE4 DASD must be attached to a 3.0Mb/sec. block multiplexer channel which can operate in data streaming mode. 3380 models AD4, AE4, AJ4 and AK4 cannot be attached to 3880 model 3 storage directors with a Speed Matching Buffer for 3380 feature (#6550). On 3880 models 1 and/or 2, storage directors attaching 3375 DASD must be attached to either a block multiplexer channel which can operate at 1.859Mb/sec. or more or must have the Speed Matching Buffer for 3375 feature (#6550). Attachment of either the 3380 without use of the Speed Matching Buffer for 3380 feature or the 3375 without use of the Speed Matching Buffer for 3375 feature, through the 3880 to 3031, 3032, 3033 or 3042 model 2 requires the Data Streaming feature (#4850) installed on the processor. Attaches to a 3081, 3083, or 3084 Processor via any block multiplexer channel.

When 3380 models AD4 or AE4 are attached to a 3880 model 3, the 3880 model 3 requires the presence of a 3380 AD4/AE4 Support feature (#8173) and two 3380 Extended specify codes (#9208).

When 3380 models AJ4 or AK4 are attached to a 3880 model 3, the 3880 model 3 requires the presence of a 3380 AJ4/AK4 support feature (#3010) and two 3380 enhanced specify codes (#9050).

On a 4361 or 4381 Processor, storage directors on 3880 models 2 or 3 attaching 3380 DASD must be attached to a 3.0Mb/sec. block multiplexer channel. This condition must be met even if the storage director has the Speed Matching Buffer for 3380 feature #6550 installed. The 4361 and 4381 Processors do not support use of feature #6550 at any data rate other than 3.0Mb/sec.

On a 4341 Processor, storage directors on 3880 models 2 or 3 attaching 3380 models A4 or AA4 DASD must either be attached to a 3.0Mb/sec. block multiplexer channel or have the Speed Matching Buffer for 3380 feature (#6550) and be attached to a 2.0 or 3.0Mb/sec. block multiplexer channel. 3880 model 3 storage directors attaching 3380 models AD4 or AE4 DASD must be attached to a 3.0Mb/sec. block multiplexer channel. On a 4381 Processor, storage directors on a 3880 model 2 or 3 attaching 3380 DASD must be attached to a 3.0Mb/sec. block multiplexer channel. Attachment of the 3380 models A4 and AA4 to 4381 processors in shared DASD environments via speed matching buffer (#6550) is supported only on 4381 3.0Mb/sec. channels. Storage directors on 3880 models 1 and 2 attaching 3350, 3370 or 3375 DASD must be attached to a 2.0 or 3.0Mb/sec. block multiplexer channel; storage directors on 3880 models 1 or 2 attaching 3330/3333 or 3340/3344 DASD may be attached to either a 1.0 (Model Group 1), 2.0 or 3.0Mb/sec. block multiplexer channel.

On a 4331 Model Group 2, a 3880 model 1 or 2 is supported only on the optional High-Speed Block Multiplexer Channel (#1431).

On a 4361 model Group 4 or model Group 5, a 3880 model 2 or 3 attaching 3380 DASD is supported only on one of the High-Speed Block Multiplexer Channels (#1431, #1432, #1433).

On a S/370 model 165-II and 168, attachment is to the 2880 Block Multiplexer Channel. On S/370 model 158, 158-3, 168 and 168-3, the S/370 Extended feature (#7730) is required in order to attach 3380 or 3375 through a 3880 model 2 or 3 when the programming support used is one of the MVS/System Program Products.

On the 9370, attachment is to the S/370 Block Multiplexer Channel (#6003). 3880 models 1 and 2 are supported by 9375 and 9377 processors only.

HIGHLIGHTS

File organization and format are under program control, allowing random or sequential processing of files. Two independent storage directors allow orderly conversion to newer 3370, 3375 or 3380 DAS. Multiple requesting allows multiple overlapped operations on DAS drives attached to each storage director. Data Integrity is provided through extensive error detection and correction capabilities. Advanced logic and improved fault detection capability provide high availability. The 3880 Model 3 now can attach the newly announced 3380 Enhanced Subsystem Models AJ4, AK4, BJ4, and BK4.

System Attachments: Each storage director attaches to a processor channel. The second of the two storage directors can attach to either the same channel as the first, or a different channel on the same processor, or a channel on a different processor. The following DASD and processor attachments are supported:

Processor(s)	DASD
4341/4361/4381	3330, 3333, 3340, 3344, 3350, 3370, 3375, 3380
4331 Md1 Group 2	3330, 3333, 3340, 3344, 3350, 3370, 3375

3380 Enh. Subsystem DASD Attach.	#9050	3 only

Notes:

- Diskette-only specify feature. There is a fee for purchased machines when DASD Attachment Configuration features are changed via MES. This fee is not charged when feature code #8173 is first installed.
- On MES orders where one of the two DASD Attachment Configuration specify codes is changed, you must also specify removal and addition of the other code, even though the code does not change. This will assure that the latest EC level of code is shipped for both storage directors.

SPECIAL FEATURES

3380 AJ4/AK4 Support (#3005): This feature allows the attachment of 3380 Models AJ4 and AK4 to the 3880 Model 003. The 3380 Models AJ4 and AK4 must have feature #9431. This feature also supports 3380 Models AD4 and AE4. This feature does not allow the attachment of 3380 Models A04 and AA4. This feature cannot be installed on machines with the Speed Matching Buffer (#6550) special feature unless it is removed. If an installed machine has the 3380 AD4/AE4 Support (#8173) special feature, it must be removed. If the attached DASD is to be cross connected to another 3880 Model 3, then both Model 3s must have #3005 installed.

Limitations: Special feature #3005 cannot be installed on 3880 Model 3s with serial numbers between 9700000 and 9709999, between X0101 and X0199, between Y0101 and Y0199, and between Z0101 and Z0199 unless RPQ 3880 Extended Feature Enable (MM2865) is also installed. Model 3s with RPQs Airline Buffer RPQ MM2741, Limited Lock w/ #8173, RPQ 8B0050, Limited Lock w/o #8173, RPQ 8S0026, Airline Buffer RPQ 8S0027, and Command Retry Modification - 3880 RPQ 8S0093 are incompatible with feature #3005. If an installed 3880 Model 3 has AD4/AE4 Support (#8173) or Speed Matching Buffer (#6550) special features installed, they must be removed. To cross connect 3380 Models AJ4 or AK4 to two IBM 3880

Storage Controls, each storage control must have matching features #3005. Maximum: One. Prerequisite: Two #9050s

(No Longer Available for Model 2)

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel connection to each storage director, or two channel connections to each storage director (using #8170). Maximum: One. Field Installation: Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8170, #8171, #6148.

Remote Switching Attachment for Eight-channel Switch (#6150): Removes the eight additional enable/disable switches provided by the Eight-Channel Switch (#8172) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Maximum: One. Field Installation: Yes. Prerequisites: #8170, #8171, #8172, #6148, #6149.

Speed Matching Buffer for 3380 (#6550): Supports attachment of 3380 models A4 and AA4 DASD to 1.5Mb/sec. block multiplexer channels on S/370 models 158, 158-3, 168 and 168-3, 3031, 3032, 3033 and 3042 model 2, and 2.0Mb/sec. block multiplexer channels on the 4341 Processor. Also supports attachment of 3380 A4 and AA4 to 3.0Mb/sec. block multiplexer channels on 3031, 3032, 3033 and 3042 model 2 that have the Data Streaming feature (#4850) with data transfer at 3.0Mb/sec., or a 3.0Mb/sec. block multiplexer channel on a 4341, 4361 or 4381 Processor. The feature is for a storage director that attaches 3380, A4 and AA4. Limitations: On a 3031, 3032, 3033 or 3042 model 2 channel group with Data Streaming (#4850), first three block multiplexer channels of the group can attach 3880 storage directors with this feature installed. When both paths of the 3380 with the dynamic path selection function are attached to a single processor, both storage directors must have the Speed Matching Buffer feature or neither may have it.

On 3031, 3032, 3033 or 3042 model 2 channel group without Data Streaming, first two block multiplexer channels of the group can attach 3880 storage directors with this feature installed. See "IBM 3031, 3032, 3033 Processor Complex Channel Configuration Guidelines", GC22-9020, for more information.

On a S/370 model 158 or 158-3, the first two block multiplexer channels can attach 3880 storage directors with this feature installed. See "Guide to the System/370 Model 158", GC20-1754, for more information.

On a S/370 model 168 or 168-3, six block multiplexer channels can attach 3880 storage directors with this feature installed. See "System/370 Model 168 Functional Characteristics", GA22-7010, for more information. Maximum: One on a 3880 model 2; two on a 3880 model 3. Field Installation: RPQ MM2865 is required as a prerequisite for field installation on machines with serial numbers 10445 through 20000. Field installable via MES on machines with serial numbers 20200 through 29999, 30200 through 39999 and 40200 through 99999. Not available for any other machines. Prerequisites: #9194 -- 3380 with #6550.

Speed Matching Buffer for 3375 (#6560): Supports attachment of 3375 DASD to 1.5Mb/sec. block multiplexer channels on S/370 Models 145, 148, 155-II, 158, 158-3, 165-II, 168, 168-3, 3031, 3032, 3033, and 3042 Model 2 Processors. Also supports attachment of 3375 to 3.0Mb/sec. block multiplexer channels on 3031, 3032, 3033 and 3042 Model 2 that have the Data Streaming Feature (#4850) with data transfer at 3.0Mb/sec., or a 2.0 or 3.0Mb/sec. block multiplexer channel on a 4341 or 4381 Processor, or the 3.0Mb/sec. block multiplexer channel on the 3081 Processor, or the optional High-Speed Channel on the 4331 Model Group 2. If channels of speeds different from 1.859 megabytes per second are switched to a storage director with Speed Matching Buffer Feature, the 3.0 and 2.0Mb/sec. block multiplexer channels are supported at the 3375 data rate (1.859Mb/sec.) and the 1.5Mb/sec. block multiplexer

channels are supported at the channel data rate (1.5Mb/sec.). The feature is for a storage director that attaches 3375. Limitations: On a 3031, 3032, 3033 or 3042 model 2 channel group with Data Streaming (#4850), first three block multiplexer channels of the group can attach 3880 storage directors with this feature installed.

On 3031, 3032, 3033 or 3042 Model 2 channel group without Data Streaming, the first two block multiplexer channels of the group can attach 3880 storage directors with this feature installed.

On a S/370 Model 155-II, the first or second block multiplexer channel can attach 3880 Storage Directors with this feature installed.

On a S/370 Model 158 or 158-3, the first two block multiplexer channels can attach 3880 Storage Directors with this feature installed.

On a S/370 Model 165-II, four block multiplexer channels can attach 3880 Storage Directors with this feature installed. On a S/370 Model 168, 168-3, six block multiplexer channels can attach 3880 Storage Directors with this feature installed.

On a S/370 Model 145 or 148, the first block multiplexer, only, can attach 3880 Storage Directors with this feature installed. Word Buffer Feature (#8810) is required on S/370 Model 145. Maximum: Two on a 3880 model 1; one on a 3880 model 2. Field Installation: Field installable on 3880 Model 1 or 2 machines with serial numbers 97-50001 and above. RPQ MM2865 is required as a prerequisite for machines with serial number 97-0001 through 97-00607. Not available for any other machines.

Two-Channel Switch Pair (#8170): To attach each storage director to a second channel. Four unique channels may be switched, two to each storage director or the same two channels may be switched to both storage directors. The channels to be switched may be on the same or on different processors. An available control unit position is required on each channel-- see "Prerequisites". Switching is under program control. Each storage director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per storage director on a 3880 with the Two-Channel Switch Pair (#8170) feature, providing four channel switch capability for both storage directors. Up to eight unique channels may be switched, four to each storage director. Each storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. Maximum: One. Field Installation: Yes. Prerequisites: #8170.

Eight-Channel Switch (#8172): For 3330/3333/3350 and/or 3380 DASD, adds switching for four additional channels per storage director on a 3880 with the Two-Channel Switch Pair and Two-Channel Switch Pair, Add'l features (#8170, #8171), providing eight channel switch capability for both storage directors. The same eight channels must be switched to both storage directors. Each storage director can be dedicated to a subset of the eight attached channels by means of an enable/disable switch. Maximum: One. Field Installation: Available at time of manufacture only. Prerequisites: #8170, #8171. Only supported for 3330/3333/3350 (#9192) and/or 3380 (#9193, #9194, #9208).

3380 AD4/AE4 Support (#8173): This feature is standard on all 3880 model 3s with serial numbers above 97-80000 that do not have Speed Matching Buffer for 3380 feature (#6550). It is required to attach 3380 models AD4 and AE4 DASD to the 3880 model 3. This feature is mutually exclusive with the Speed Matching Buffer for 3380 feature (#6550). To attach 3380 AD4/AE4 Support (#8173) to a 3880 model 3, it is necessary to remove the Speed Matching Buffer(s) first. Feature #8173 incorporates that removal where it is required. (Some parts are re-used in the process.) The 3380 AD4/AE4 Support feature can be installed on 3880 model 3s with serial numbers 97-50001 to 97-59999, 97-70000 to 97-79999. The feature cannot be installed on 3880 model 3s with serial numbers between 97-00000 and 97-09999, or 97-60000 and 97-69999. One feature provides both storage directors with 3380 AD4 and AE4 DASD attachment capability. Unless a Speed Matching Buffer for 3380 feature is ordered, all orders for 3880 model 3s must include one 3380 AD4/AE4 Support feature (#8173), and two 3380 Extended specify codes (#9208). Limitation: 3380 AD4/AE4 Support feature (#8173) cannot be installed on a 3880 model 3 with a Speed Matching Buffer

for 3880 feature (#6550) or on 3880 model 3s with serial numbers between 97-00000 and 97-09999, or 97-60000 and 97-69999. Prerequisite: Two 3380 Extended specify code #9208s.

When placing an MES order to enable 3880 model 3 to attach 3380 models AD4 and AE4 DASD, the following procedures apply:

- If there is no Speed Matching Buffer for 3380 feature, the MES Order should show:
 - Add: One (1) #8173 3380 AD4/AE4 Support feature, and two (2) #9208 3380 Extended specify codes.
 - Delete: Two (2) #9193 3380 w/o #6550 specify codes.
- If there is one Speed Matching Buffer for 3380 feature (and the customer does not wish to retain the complete SMB parts,) the MES Order should show:
 - Add: One (1) #8173 3380 AD4/AE4 Support feature, and two (2) #9208 3380 Extended specify codes.
 - Delete: One (1) #6550 Speed Matching Buffer for 3380, one (1) #9193 3380 w/o #6550 specify codes, and one (1) #9194 3380 with #6550 specify code.
- If there are two Speed Matching Buffers for 3380 features (and the customer does not wish to retain the complete SMB parts), the MES Order should show:
 - Add: One (1) #8173 3380 AD4/AE4 Support feature, and two (2) #9208 3380 Extended specify codes.
 - Delete: Two (2) #6550 Speed Matching Buffer for 3380, and two (2) #9194 3380 with #6550 specify codes.

Note: All 3880 model 3s starting with serial number 97-80000 except those with Speed Matching Buffer for 3380 feature (#6550), will be

equipped with 3380 Extended specify codes (#9208). Whenever 3380 model AA4s are attached to a storage director of 3880 model 3 with a #9208 specify code and also to a prior 3880 model 3 with #9193 specify code, it is necessary for the #9193 specify code to be at EC level 461461 or higher.

MODEL CONVERSIONS

Model upgrades are field installable. MES orders for model upgrades must include removal of old DASD Attachment Configuration specify codes and addition of new specify codes. When models 1 or 2 are upgraded to a model 3, they will attach 3380 models A4, AA4 and B4, but not models AD4/BD4, AE4/BE4, AJ4/BJ4, or AK4/BK4. 3380 AD4/AE4 Support feature (#8173) and two 3380 Extended specify codes (#9208) must be ordered by MES to support attachment of 3380 models AD4/BD4 and/or models AE4/BE4.

Note: See feature #8173 description for serial number restrictions before ordering.

3380 AJ4/AK4 support feature (#3005) and two 3380 enhanced specify codes (#9050) must be ordered by MES to support attachment of 3380 models AJ4/BJ4 and/or models AK4/BK4.

Note: See feature #3005 description for serial number restrictions before ordering.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3880 STORAGE CONTROL MODEL 4

PURPOSE

Provides a single control unit path, called a Storage Director, for 3370 and 3375 Direct Access Storage. The model 4 contains one Storage Director that provides for attachment of up to four 3370 models A1 and A2 in any combination, or up to four 3375 model A1s. See DASD Attachment Configuration under "Specify" and M3370 and 3375 pages.

MODEL 4

Model 4 004

Limitations:

1. See M3370 and 3375 pages for system limitations.
2. 3370s and 3375s cannot both be attached to the storage director at the same time.

Maximum: A maximum of four 3370 models A1 and A2 in any combination, or four 3375 model A1s can be attached -- see M3370 and 3375 pages.

Prerequisites: An available control unit position on a block multiplexer channel for the storage director. One unshared sub-channel is required for each logical address attached to a block multiplexer channel.

On the 4331-2 or 4361, the Storage Director must be attached to a High-Speed Block Multiplexer Channel (#143X).

On the 4341, the Storage Director must be attached to a 2.0Mb/sec. Block Multiplexer Channel.

On the 4381, the Storage Director must be attached to either a 3.0Mb/sec. Block Multiplexer channel or to a 2.0Mb/sec. Block Multiplexer Channel.

On the 9370, the Storage Director must be attached to the Block Multiplexer Channel (#6003). Supported by 9375 and 9377 processors only.

HIGHLIGHTS

File organization and format are under program control, allowing random or sequential processing of files; data integrity is provided through extensive error detection and correction capabilities; advanced logic and improved fault detection capability provide high availability.

Systems Attachment: The single storage director attaches to a processor channel. The following DASD and processor attachment is supported:

Processor	DASD
4331-2	3370, 3375
4341	3370, 3375
4361	3370, 3375
4381	3370, 3375
9370	3370, 3375

Bibliography: GC20-0001

DASD Attachment Configuration: Only one of the following may be specified:

Attachment Specify

3370	#9201
3375	#9202

Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES.

Color: #9060 for willow green #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, or #9065 for pebble gray.

SPECIAL FEATURES

Two-Channel Switch (#8160): To attach the storage director to a second channel. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel; see "Prerequisites" above. Switching is under program control. The storage director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

3880 STORAGE CONTROL MODEL 11

(NO LONGER AVAILABLE)

PURPOSE

The 3880 Storage Control model 11 modifies the first Storage Director, called the Paging Storage Director, to manage dynamically an 8Mb solid-state storage unit, for page and swap data. The storage unit is divided into a directory and a cache. Up to eight actuators of 3350 disk storage provide backing storage for the cache. The second Storage Director operates in a conventional manner, as a 3880 Model 1 Storage Director, for 3330/3333 and 3350 direct access storage only.

MODEL 11

Model 11 D11: Provides 8,388,608 bytes of Subsystem Storage.

Prerequisites: An available control unit position on a block multiplexer channel for each Storage Director. Four unshared subchannels are required for each 3350 device attached to the Paging Storage Director. One unshared subchannel is required for each 3350 or 3333/3330 device attached to the other Storage Director. The channel must be able to provide either a 1.5 or 3.0Mb/sec. capability.

Attaches to a 3081 or 3083, 3084, or 3090 Processor Unit via a block multiplexer channel.

Attaches to a 303X or 3042 Attached Processor model 2 via either a 1.5 or 3.0Mb/sec. channel. In order to operate at 3.0Mb/sec., the Data Streaming Feature (#4850) is required.

On a S/370 model 168 or 168-3, attachment is to a 2880 Block Multiplexer Channel capable of 1.5Mb/sec.

On a S/370 model 158 or 158-3, attachment is to any block multiplexer channel capable of 1.5Mb/sec.

On a 4341 and 4381, Storage Directors attaching 3350 DASD must be attached to a 2.0 or 3.0 Mb/sec. block multiplexer channel. Data rate will be up to 1.5 or 3.0 Mb/sec. respectively for the Paging Storage Director. See M4341 and 4381 pages for information.

Maximum: The Paging Storage Director is limited to attaching one 3350 model A2/A2F and three model B2/B2Fs, or one 3350 model A2/A2F, two model B2/B2Fs and one C2/C2F. The other Storage Director attaches 3330/3333/3350 DASD: a maximum of four 3333 model 1s, 3333 model 11s, and/or 3350 model A2s/A2Fs in any combination. Each string with a 3333 model 1 or 11 may attach up to three 3330 model 1/2s or 11s. Each string with a 3350 model A2/A2F may attach up to three 3350 model B2/B2Fs or up to two 3350 model B2/B2Fs and a 3350 model C2/C2F.

Limitations:

1. The 3350 model A2/A2F or C2/C2F attached to the Paging Storage Director may not be actively string switched to another Storage Director (i.e., String Switch special feature (#8150) on the 3350 is not supported). The switch may be installed but it is recommended that the switch should be manually positioned to the Paging Storage Director.
2. See M3330, 3333, 3350 for system support limitations.
3. 3350 DASD attached to either 3880 model 11 Storage Director must be in native mode format; 3330 models 1 and 11 Compatibility Mode are not supported.
4. All 3880 model 11 conversions require a 3880 model 1 as the converted-from machine.

US manufactured 60 Hz machines: Eligible 3880 machines that can be field model converted are 3880 models with serial

numbers between 20200 and 29999, 30200 and 39999, and 40200 and 99999.

US manufactured 50 Hz machines: Eligible 3880 machines that can be field model converted are 3880 models with serial numbers between X0201 and X9999, Y0201 and Y9999, and Z0201 and Z9999.

Non-US manufactured 50 Hz machines: Eligible 3880 machines that can be field model converted are 3880 models with serial numbers between 9750004 and 9759999.

5. While the Paging Storage Director may be attached to more than one host system for backup reasons, true dynamic sharing of the paging devices is not supported.
6. The 3880 special feature Eight-Channel Switch (#8172) is not supported.

HIGHLIGHTS

- Access to page and swap data in the cache at electronic speeds and transfer at channel speeds of up to 1.5 or 3.0Mb/sec. Up to 3.0Mb/sec. data rates are provided on data streaming channels only.
- Attaches to 1.5, 2.0 or 3.0Mb/sec. channels (Data rate on a 2.0Mb/sec. channel is up to 1.5Mb/sec.).
- Multiple exposures for 3350s attached to the Paging Storage Director in a similar manner to that provided by the 2305 Fixed Head Storage.
- Easy migration.
- Dynamically managed cache.
- Subsystem Storage size of 8MB.
- The 3880 model 11 will attach to a 1.5, 2.0 or 3.0Mb/sec. block multiplexer channel on S/370 models 158 or 168, 303X, 3042 Attached Processor model 2, 4341, 4381, 3081, 3083, 3084 or 3090 Processor. On a 303X or 3042 Attached Processor model 2, the Data Streaming Feature (#4850) is required for operation in data streaming mode at 3.0Mb/sec.
- MVS/SP Release 3 and MVS DFDS Support.
- VM/SP High-Performance Option Release 3 Support.

System Attachments: Each Storage Director attaches to a processor block multiplexer channel whose speed may be 1.5, 2.0 or 3.0Mb/sec. (Data rate on a 2.0Mb/sec. channel is up to 1.5Mb/sec.) The second of the two Storage Directors can attach to either the same channel as the first, or a different channel on the same processor, or a channel of a different processor. These channels need not be the same speed. Only the following DASD and Processor attachments are supported (note the Paging Storage Director attaches to 3350 devices only):

Processor(s)	DASD
4341 Md1 Grps 1,2	3330, 3333, 3350
4381	3330, 3333, 3350
S/370 mdls 158,158-3, 168,168-3,3131,3032, 3033,3042 mdl 2,3081, 3083,3084,3090	3330, 3333, 3350

Publications: GC20-0001

- DASD Attachment Configuration: Specify one each of the following; one for each Storage Director:

Attachment	Specify
3330/3333/3350	#9192 *
3350/Paging	#9196 *

* Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES. Note: The specify features must be changed when field model conversions of 3880 model 1 to model 11 occur. See "Model Conversions".

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble grey.

SPECIAL FEATURES

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel connection to each Storage Director, or two channel connections to each Storage Director when using the Two-Channel Switch Pair (#8170). Maximum: One. Field Installation: Yes.

Remote Switch Attachment, Add'l (#8149): Removes the four additional enable/disable switches provided by the Two-Channel Switch Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Prerequisites: #8170, #8171 and #6148. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair (#8170): To attach each Storage Director to a second channel. Four unique channels may be switched, two to each Storage Director or the same two channels may be switched to both Storage Directors. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each Storage Director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per Storage Director on a 3880 equipped with a Two-channel Switch Pair (#8170), providing four-channel switch capability for both Storage Directors. Up to eight unique channels may be switched, four to each Storage Director. Each Storage Director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. Maximum: One. Prerequisites: #8170. Field Installation: Yes.

MODEL CONVERSIONS (NO LONGER AVAILABLE)

MES orders for field model conversion of the 3880 model 1 to model 11 must include removal of both the old DASD Attachment Configuration specify codes from the 3880 model 1 and the addition of the new specify codes #9196 and #9192 for the model 11. All 3880 model 11 field model conversions require a 3880 model 1 as the converted from machine. Field installation on purchased machines involves removal of parts that become the property of IBM. Note machine serial number restrictions outlined in point 4 of the Limitations section.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3880 STORAGE CONTROL MODEL 13

(NO LONGER AVAILABLE)

PURPOSE

Provides two independent control unit paths, called cache storage directors, for 3380 Direct Access Storage devices. Each cache storage director shares access to an electronic storage unit, called subsystem storage, to two cache storage directors, to the subsystem storage and attached 3380 DASD forming a caching subsystem. The two cache storage directors and subsystem storage are contained in a single caching subsystem. For improved data availability, two 3880s may be attached in a Dual Frame Configuration. In this configuration, one cache storage director from each frame is part of each subsystem. The cache retains frequently used application data for fast access by the host, and the directory contains entries to locate data in the cache.

MODEL 13

Model B13: 4,194,304 bytes of Subsystem Storage.

Model D13: 8,388,608 bytes of Subsystem Storage.

Prerequisites: An available control unit position on a 3.0Mb/sec. data streaming channel for each cache storage director. One unshared subchannel is required for each logical address attached to a block multiplexer channel. Dynamic Path Selection (3880 model AA4) is required for attached DASD.

Attaches to a 3081, 3083, 3084 or 3090 Processor Unit via any block multiplexer channel.

Attachment to a 3031, 3032, 3033 or 3042 Attached Processor model 2 requires data streaming (#4850) on the processor's channel group.

4341 models manufactured before March, 1981, require an engineering change to achieve data streaming on their 3.0Mb/sec. channels.

Maximum: A 3880 model 13 may attach one or two 3380 model AA4s. Each string with a 3380 model AA4 may attach up to three 3380 model B4s. Each 3380 AA4 must be attached to both cache storage directors on the same caching system.

Limitations:

- See M3380 pages for system support limitations.
- In a single frame configuration, 3380 units that are attached to a 3880 model 13 cache storage director must also attach to the other cache storage director in the same 3880 model 13. In a Dual Frame Configuration, each 3380 must attach to a cache storage director in each frame. The two cache storage directors that share the 3380's must also share a subsystem storage.
- Speed Matching Buffer for 3380 (#6550) cannot be installed.
- A single channel cannot attach to both cache storage directors in a caching subsystem.
- (US manufactured 60 Hz machines) All 3880 models with serial numbers between 20200 and 29999, 30200 and 39999, and 40200 and 99999 can be field model converted to model 13s after conversion to 3880 model 3.

(US manufactured 50 Hz machines) All 3880 models with serial numbers between X0201 and X9999, Y0201 and Y9999, and Z0201 and Z9999 can be field model converted to model 13s after conversion to 3880 model 3s.

(Non-US manufactured 50 Hz machines) All 3880 models with serial numbers between 975004 through 975999 can be field model converted to model 13s after conversion to 3880 model 3.

HIGHLIGHTS

Provides fast access to disk application data records in the cache storage. Helps reduce the effect of DASD skew. Cache contents are dynamically managed by a modified Lease Recently Used (LRU) algorithm. Requires no more floor space than other 3880 models. Data integrity is provided through extensive error detection and correction capabilities and the architecture of the cache implementation.

Systems Attachments: Each cache storage director attaches to a 3.0Mb/sec. data streaming channel. The second of the two cache storage directors can attach to a different channel on the same processor, or a channel on a different processor. The following Processor attachments are supported:

Processor(s)	DASD
3081, 3083, 3084, 3090, 3033, 3032, 3031, and 3042 mdl 2	3380
4341, 4381	3380

- Machine Nomenclature:

Brazilian (Portuguese)	#2938	German	#2929
English	#2927	Japanese	#2930
French	#2928	Spanish	#2931

- DASD Attachment Configuration: Specify two #9197s *; one for each cache storage director.

* Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES. Note: The specify feature for each storage director must be changed when field model converting 3880 models to the model 13. See point 5 under "Limitations" section for field model conversion information.

- Color: #9060 for willow green, #9061 for garnet rose #9062 for sunrise yellow, #9063 for classic blue #9064 for charcoal brown, #9065 for pebble gray.

SPECIAL FEATURES

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel

connection to each cache storage director, or two channel connections to each cache storage director when using the Two-Channel Switch Pair (#8170). Maximum: One. Field Installation: Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Maximum: One. Prerequisites: #8170, #8171, #6148. Field Installation: Yes.

Remote Switch Attachment For Eight-Channel Switch (#6150): Removes the eight additional enable/disable switches provided by the Eight-Channel Switch (#8172) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Maximum: One. Prerequisites: #8170, #8171, #6148, #6149, #8172. Field Installation: Yes.

Two-Channel Switch Pair (#8170): To attach each cache storage director to a second channel. Four unique channels may be switched, two to each cache storage director. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each cache storage director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per cache storage director on a 3880 equipped with a Two-Channel Switch Pair (#8170), providing four-channel switch capability for both cache storage directors. Up to eight unique channels may be switched. Each cache storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. Maximum: One. Prerequisites: #8170. Field Installation: Yes.

Eight-Channel Switch (#8172): The Eight-Channel Switch Feature allows up to eight host systems to access either storage director in a 3880 storage control. The same eight channels must attach to both storage directors in that storage control. The Eight-Channel Switch Feature then combines with the Dual Frame Configuration option to allow up to 16 attaching channels to access each attached DASD. Note: The Eight-Channel Switch Feature can be fully utilized only in the Dual Frame Configuration (see Limitation Item 4). Maximum: One. Prerequisites: #8170, #8171. Field Installation: No.

MODEL CONVERSIONS (NO LONGER AVAILABLE)

Field installable. MES orders for field model conversions must include removal of both old DASD Attachment Configuration specify codes and the addition of the new specify code (#9197) for each cache storage director on the model 13. All 3880 model 13 field model conversions assume a 3880 model 3 as the converted from machine. Note the machine serial number restrictions outlined in point 6 of the "Limitations" section. See M3880 pages for information about field model converting 3880 models 1 and 2 to a 3880 model 3.

Parts removed or replaced when upgrading from other 3880 models to a 3880 model 13 become the property of IBM.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3880 STORAGE CONTROL MODEL 21

PURPOSE

The 3880 Storage Control model 21 modifies both storage directors to manage dynamically a 16, 32, 48, or 64Mb solid-state storage unit, for page and swap data. The storage unit is divided into a directory and a cache. Up to two strings of 3350 disk storage provide backing storage for the cache.

MODEL 21

Model E21 E21: Provides 16Mb of Subsystem Storage.

Model G21 G21: Provides 32Mb of Subsystem Storage.

Model H21 H21: Provides 48Mb of Subsystem Storage.

Model J21 J21: Provides 64Mb of Subsystem Storage.

Prerequisites: The two-channel switch feature is required. An available control unit position on a block multiplexer channel for each storage director. Four unshared subchannels are required for each 3350 device attached to the 3880 model 21. The channel must be able to provide either a 1.5 or 3.0Mb/sec. capability. With feature #6140, the model 21 can attach to 3090 4.5Mb/sec. channels.

Maximum: The 3880 model 21 is limited to attaching up to two 3350 model A2/A2Fs. A 3350 model A2/A2F may attach up to one model B2/B2F or one C2/C2F. All models A2, A2F, C2, and C2F attached must have the special feature String Switch (#8150).

Limitations:

1. See M3350 pages for system support limitations.
2. 3350 DASD attached to either 3880 model 21 storage director must be in native mode format; 3330 models 1 and 11 Compatibility Mode are not supported.
3. While a storage director may be attached to more than one host system for backup reasons, true dynamic sharing of the paging devices is not supported.
4. The 3880 special feature Eight-Channel Switch (#8172) is not supported.
5. Only 3880 models 1 and 11 may be field model converted to a model 21; this MES is purchase-only and can only be applied to purchased models 1 and 11. If the converted-from machine is a 3880 model 1, then only machines with the following serial numbers may be converted:
 - US manufactured 60 Hz machines: 20200 to 29999.
 - US manufactured 50 Hz machines: X0201 to X9999.

Non-US manufactured 50 Hz machines: 97-50001 to 97-59999; 97-70001 and above.

Note: The 3880 model 21 requires the Two-Channel Switch feature #8170; this must be added if the converted machine lacks this feature.

Parts removed or replaced when field model converting a machine become the property of IBM.

HIGHLIGHTS

- Follow-on product to the 3880 model 11 and upgradable from it.
- Subsystem Storage sizes of 16, 32, 48, and 64Mb using 256K bit Dynamic Random Access Memory technology.

- Improved transfer path allowing concurrent operations between cache and channel and DASD and cache.
- Access to page and swap data in the cache at electronic speeds and transfer at channel speeds of up to 1.5 or 3.0Mb/sec. Up to 3.0Mb/sec. data rates are provided on data streaming channels only.
- Attaches to 1.5, 2.0 or 3.0Mb/sec. channels (data rate on a 2.0Mb/sec. channel is up to 1.5Mb/sec.).
- Multiple exposures for 3350s attached to the 3880 model 21 in a similar manner to that provided by the 3880 model 11.
- Easy migration.
- Dynamically managed cache.
- MVS/370 support.
- MVS/XA support.
- For VM - VM/SP High Performance Option Release 3.4 or VM/XA Migration Aid Release 2.0 as a dedicated device.
- On 3880 Model 21, feature #6140 allows cache-to-host transfers at speeds up to 4.5Mb/sec. on 3090 4.5Mb/sec. channels.

System Attachments: Each storage director attaches to a processor block multiplexer channel whose speed may be 1.5, 2.0 or 3.0Mb/sec. (Data rate on a 2.0Mb/sec. channel is up to 1.5Mb/sec.) The second of the two storage directors would normally be attached to a different channel on the same processor complex. These channels need not be the same speed. Only the following processor attachments are supported:

- 4341 and 4381
- 3031, 3032, 3033, 3042 model 2, 3081, 3083, 3084, 3090
- 9375, 9377

Attaches to a 3090 Processor Unit via a block multiplexer channel. If feature #6140 is installed, the Model 21 can operate at rates up to 4.5Mb/sec. on 4.5Mb/sec. channels.

Attaches to a 308X Processor Unit via a block multiplexer channel.

Attaches to a 303X or 3042 Attached Processor model 2 via either a 1.5 or 3.0Mb/sec. block multiplex channel. In order to operate at 3.0Mb/sec. the Data Streaming Feature (#4850) is required. On a 4341 or 4381, storage directors attaching 3350 DASD must be attached to a 2.0 or 3.0Mb/sec. block multiplexer channel. Data rate will be up to 1.5 or 3.0Mb/sec., respectively, for the storage directors. See M4341 and 4381 pages for more information.

On a 9370 Processor, attachment is supported in environment 1 only. See M9370 pages for more information.

* Diskette-only specify feature. No fee when ordered at time of manufacture or field model conversion. Note: Attachment specify codes must be changed when field model conversions of 3880 model 1 or 11 to model 21 occur. See "Model Conversions".

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.

SPECIAL FEATURES

4.5Mb/Sec. Support (#6140): Support for cache-to-host transfers on 4.5Mb/sec. channels on 3090 Processors for 3880 Storage Control Models D21, E21, G21, H21, and J21. Limitations: 3880 Model 21 with feature #6140 4.5Mb/sec. support must use Cable Group 0185 on 4.5Mb/sec. channels. They must follow all 3990 Storage Controls on those channels and must precede all other storage controls. Maximum: One. Prerequisite: Cable Group 0185 on 4.5Mb/sec. channels.

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the two channel connections to each storage director when using the Two-Channel Switch Pair (#8170). Maximum: One. Field Installation: Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Prerequisites: #8170, #8171 and #6148. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair (#8170): (Required) To attach each storage director to a second channel. Four unique channels may be

switched, two to each storage director or the same two channels may be switched to both storage directors. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each storage director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per storage director on a 3880 equipped with a Two-Channel Switch Pair (#8170), providing four-channel switch capability for both storage directors. Up to eight unique channels may be switched, four to each storage director. Each storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. Maximum: One. Prerequisites: #8170. Field Installation: Yes.

MODEL CONVERSIONS

All 3880 model 21 field model conversions require a purchased 3880 model 1 or 11 as the converted from machine. MES orders for field model conversion of the 3880 model 1 and 11 to model 21 must include removal of both the old DASD Attachment Configuration specify codes from the 3880 model 1 or 11 and the addition of two new specify codes #9206, one on each director of the 3880 model 21. Note that the 3880 model 21 requires the Two-Channel Switch feature #8170. This must be added if the converted machine lacks this feature. A 3880 model 21 model can be field upgraded to a larger cache memory size model. A purchased memory upgrade may be applied only to a purchased 3880 model 21; a rental (MRC) memory upgrade may be applied only to a rental (MRC) 3880 model 21. Field installation on purchased machines involves removal of parts that become the property of IBM. Note machine serial number restrictions outlined in point 5 of "Limitations".

ACCESSORIES (NONE)

SUPPLIES (NONE)

3880 STORAGE CONTROL MODEL 23

PURPOSE

The 3880 model 23 and the attached 3380 DASD form a high performance cache/DASD subsystem for application data. Cache memory of 8, 16, 32, 48, or 64Mb includes a cache and a directory. The cache retains frequently used application data for fast access by the host, and the directory contains entries to locate data in the cache. Cache contents are dynamically managed by a modified least recently used (LRU) algorithm. The intent is to keep the high-activity data in the cache to provide data access without the mechanical delays of DASD.

The 3880 model 23 provides two independent control unit paths, called Cache Storage Directors, for 3380 models AA4/B04, AD4/BD4, AE4/BE4, AJ4/BJ4, and/or AK4/BK4 direct access storage devices. Note that attaching AJ4 or AK4 requires feature #3010 (with this feature 3380 Models AA4 and A04 are not supported). Each Cache Storage Director shares access to an electronic storage unit, called Subsystem Storage, and to the attached 3380 models AA4/B04, AD4/BD4, AE4/BE4, AJ4/BJ4, and/or AK4/BK4 direct access storage devices, forming a single caching subsystem called a single frame configuration. For improved data availability, two 3880s may be attached in a dual frame configuration. The dual frame configuration allows alternate path access to all attached DASD even if one of the two model 23s is unavailable. In this configuration, each string must attach to a cache storage director in each control unit. The two storage directors that have common 3380s also share the same subsystem storage.

MODEL 23

Model D23 D23: 8Mb of Subsystem Storage.

Model E23 E23: 16Mb of Subsystem Storage.

Model G23 G23: 32Mb of Subsystem Storage.

Model H23 H23: 48Mb of Subsystem Storage.

Model J23 J23: 64Mb of Subsystem Storage.

Prerequisites: An available control unit position on a 3.0Mb/sec. or 4.5Mb/sec. block multiplexer channel for each Cache Storage Director. One unshared subchannel is required for each logical address.

Two-Channel Switch (#8170) is required.

Attaches to a 3090, 3084, 3083, 3081, 3042 model 2, 3033, 3032, 3031, 4343, 4381, 9375, and 9377 processor unit via 3.0Mb/sec. block multiplexer channel. With feature #6140, the model 23 can attach to 3090 4.5Mb/sec. channels. 3031, 3032, 3033, and 3042 model 2 require the data streaming feature.

4341 models manufactured before March, 1981, require an engineering change to achieve data streaming on their 3.0Mb/sec. channels.

Maximum: A 3880 model 23 may attach one or two 3380 model AA4s, AD4s, AE4s, AJ4s, or AK4s. A 3380 string is comprised of one model AXX and from zero to three model BXX. Further, two 3380 model AXX can be attached to one 3880 storage director, allowing up to eight 3380 units per storage director. (See items 2 and 3 in "Limitations" section for attachment restrictions).

Limitations:

1. See M3880 for system support limitations.
2. In a single frame configuration, DASD strings that are attached to a 3880 model 23 Cache Storage Director must also attach to the other Cache Storage Director in the same 3880 model 23. In a dual frame configuration, each DASD string must attach

to a Cache Storage Director in each frame. The two Cache Storage Directors that share the DASD strings must also share a subsystem storage.

3. Models BD4 and BE4 can be intermixed within strings headed by either a model AD4 or model AE4. Models BO4 can attach only to strings headed by model AA4. Strings headed by models AA4, AD4, and AE4 can be paired in any combination on any two storage directors within a 3880 model 23 configuration.
4. Models BJ4 and BK4 can be intermixed within strings headed by either a model AJ4 or model AK4. Strings headed by models AD4, AE4, AJ4, or AK4 can be paired in any combination on any two storage directors within a 3880 model 23 configuration. Feature #3010 is mandatory to attach AJ4 or AK4.
5. Speed Matching Buffer for 3380 (#6550) cannot be installed.

Note: A 3880 model 3 with one or two speed matching buffers (SMB) can be converted to a 3880 model 23. This conversion removes the SMB(s) and does not require a separate MES for the removal. However, if the machine is purchased and the customer wants to retain the SMB parts, an RPQ to remove the SMB should be ordered and installed prior to the conversion of the model 23.

6. A single channel cannot attach to both Cache Storage Directors in a caching subsystem.
7. The Eight-Channel Switch is fully utilized for frames attached in a Dual Frame Configuration.
8. 3880 machines that can be field model converted to an 3880 model 23 are only purchased 3880 model 1, 2, 3, 11, 13, or 21s.

US manufactured 60 Hz machines: All 3880 model 1s, 2s, 3s, 11s, 13s, or 21s with serial numbers between 20200 and 29999, 30200 and 39999, and 40200 and 99999 can be field converted to model 23s.

US manufactured 50 Hz machines: All 3880 model 1s, 2s, 3s, 11s, or 13s with serial numbers between X0201 and X9999, Y0201 and Y9999, and Z0201 and Z9999 can be field model converted to model 23s.

Non-US manufactured 50 Hz machines: All 3880 model 1s, 2s, 3s, 11s, 13s, or 21s with serial numbers between 975004 and 975999 can be field converted to model 23s.

Parts removed or replaced when field model converting a machine become the property of IBM.

HIGHLIGHTS

Provides fast access to disk application data records in the cache storage. As the workload and the DASD activity change, cache contents are dynamically managed by a modified least recently used (LRU) algorithm to keep high activity data in the cache. This prevents a subset of the DASD actuators from becoming a bottleneck. Requires no more floor space than other 3880 models. Data integrity is provided through extensive error detection and correction capabilities and the architecture of the cache implementation. The latest copy of data in the cache is the same as the copy on DASD. The 3880 Model 23 can now attach the newly announced 3380 Enhanced Subsystem Models AJ4, AK4, BJ4, and BK4. On 3880 Model 23, feature #6140 allows cache-to-host transfers at speeds up to 4.5Mb/sec. on 3090 4.5Mb/sec. channels.

System Attachments: Each cache storage director attaches to a 3.0Mb/sec. data streaming channel. The second of the two cache storage directors can attach to a different channel on the same processor, or a channel on a different processor. The following processor attachments are supported: 3090, 3084, 3083, 3081, 3042 model 2, 3033, 3032 3031, 4381, 4341, 9375, and 9377.

The 3031, 3032, 3033, and 3042 model 2 require data streaming feature (#4850). 4341 models manufactured before March, 1981, require an engineering change to achieve data streaming on their 3.0Mb/sec. channels.

- **Machine Nomenclature:**

Brazilian	German #2929
(Portuguese) #2938	English #2927
Japanese #2930	French #2928
Spanish #2931	
- **DASD Attachment Configuration:** Specify two #9207s *, one for each storage director.

* Diskette-only specify feature. No fee when ordered at time of manufacture or with model change. Note: The specify feature for each storage director must be #9207 or changed to #9207 when field model converting 3880 models to the model 23. See point 7 under "Limitations" section for field model conversion information.
- **#9055 3880 Model 23 DASD Configuration:** This specify is required for feature code #3010 and must be ordered twice. If this is a MES order for feature #3010, remove specify #9207 twice.
- **Color:** #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.

SPECIAL FEATURES

- **3380 AJ4/AK4 Support (#3010):** This feature allows the attachment of 3380 Models AJ4 and AK4 to the 3880 Models D23, E23, G23, H23, and J23. The 3380 Models AJ4 and AK4 must have feature #9431. It also supports 3380 Models AD4 and AE4. This feature does not allow the attachment of 3380 Models A04 and AA4. If the attached DASD is to be cross connected to another IBM 3880 Model 23 then both Model 23s must have #3010 installed. Limitations: Model 23 Special Feature #3010 is incompatible with the Record Cache RPQ 8B0035. To cross connect 3380 Models AJ4 or AK4 to two IBM 3880 Storage Controls, each storage control must have matching features #3010. Maximum: One. Prerequisite: Two #9055s.
- **4.5Mb/Sec. Support (#6140):** Support for cache-to-host transfers on 4.5Mb/sec. channels on 3090 Processors for 3880 Storage Control Models D23, E23, G23, H23, and J23. Limitations: 3880 Models 23 with feature #6140 4.5Mb/sec. support must use Cable Group 0185 on 4.5Mb/sec. channels. They must follow all 3990 Storage Controls on those channels and must precede all other storage controls. Model 23 Special Feature #6140 is incompatible with the Record Cache RPQ 8B0035. Maximum: One. Prerequisite: Cable Group 0185 on 4.5Mb/sec. channels.

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of two channel connections to each cache storage director when using the Two-Channel Switch Pair (#8170). Maximum: One. Field Installation: Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Prerequisites: #8170, #8171 and #6148. Maximum: One. Field Installation: Yes.

Remote Switch Attachment for Eight-Channel Switch (#6150): Removes the eight additional enable/disable switches provided by the Eight-Channel Switch (#8172) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. Prerequisites: #8170, #8171, #8172, #6148, #6149. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair (#8170): (Required) To attach each cache storage director to a second channel. Four unique channels may be switched, two to each cache storage director. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each cache storage director can be dedicated to a single channel by means of an enable/disable switch. Maximum: One. Field Installation: Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per cache storage director on a 3880 equipped with a Two-Channel Switch Pair (#8170), providing four-channel switch capability for both cache storage directors. Up to eight unique channels may be switched. Each cache storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. Prerequisites: #8170. Maximum: One. Field Installation: Yes.

Eight-Channel Switch (#8172): The Eight-Channel Switch feature allows up to eight host systems to access either storage director in a 3880 storage control. The same eight channels must attach to both storage directors in that storage control. The Eight-Channel Switch feature then combines with the Dual Frame Configuration option to allow up to 16 attaching channels to access each attached DASD. Note: The Eight-Channel Switch feature can be fully utilized only in the Dual Frame Configuration (see "Limitations", Item 6). Prerequisites: #8170, #8171. Maximum: One. Field Installation: No.

MODEL CONVERSIONS

Field installable. If the old DASD Attachment Configuration specify code is other than #9207, MES orders for field model conversions must include both the removal of old DASD Attachment Configuration specify codes and the addition of two new specify codes #9207, one for each cache storage director on the model 23. All 3880 model 23 field model conversions assume a purchased 3880 model 1, 2, 3, 11, 13 or 21 as the converted-from machine. Note the machine serial number restrictions outlined in point 7 of "Limitations".

Parts removed or replaced when upgrading or converting from other 3880 models to a 3880 model 23 become the property of IBM.

ACCESSORIES (NONE)

SUPPLIES (NONE)

3890 DOCUMENT PROCESSOR

PURPOSE

Reads magnetically inscribed data from card and paper documents into any virtual storage S/370 (except 3115 and 3125) or to a 3090 processor or 4300 processor via the byte multiplexer or block multiplexer channel. Can be used offline for document sorting.

MODELS

Models A1, A2, A3, A4, A5, A6: 13,312 bytes of storage (10,240 bytes if image processing) for stacker select programs and initialization data.

Model	Stackers
A1 A01	6
A2 A02	12
A3 A03	18
A4 A04	24
A5 A05	30
A6 A06	36

Models E2, E3, E4, E5, E6: 13,312 bytes of storage (10,240 bytes if image processing) for stacker select programs and initialization data.

Model	Stackers
E2 E02	12
E3 E03	18
E4 E04	24
E5 E05	30
E6 E06	36

HIGHLIGHTS

The 3890 is a buffered, modular, pocket reader-sorter which is time-independent. The 3890 mdl A is available with 6 to 36 stackers in increments of 6. The 3890 mdl E is available with a minimum of 12 stackers expandable to 36 in increments of 6. Also, the 3890 mdl E includes as standard: Microfilming and System/370, 30XX, and 4300 Attachment. These features are optional on the 3890 mdl A.

Documents are read at a minimum rate of 2,400 6-inch documents per minute for the 3890 mdls A1 through A6. The 3890 mdls E3 through E6 read at a minimum of 1680 6-inch documents per minute. Actual through put depends upon length of document. The formula for determining the approximate average rated throughput per minute is: The percentage of non-card stock checks x (19,200/(average document length, which is 6 in. or greater plus 2 in.)) + the percentage of card stock checks x 1,907. For the 3890 mdl E the results of this calculation should be multiplied by 0.7. The primary component of the 3890 is the feed module, which contains the input hopper, recognition circuits, logic to determine stacker selection, merge feed, options when installed, and operator setup and run panels.

Input Hopper, 3890 Mdl A: Holds approximately 4,800 documents and permits convenient, continuous loading. A jogger is built into the hopper to eliminate jogging as a separate operation.

Input Hopper, 3890 Mdl E: Holds approximately 3,800 documents and permits convenient, continuous loading. Do not include a built-in jogger. Jogging must be performed as a separate operation. About 2,200 additional documents, previously jogged, may be placed in a separate staging area adjacent to the input hopper.

Merge Feed: Permits the merging of documents into the normal input stream from a separate hopper. Document capacity is 600.

Document merging is controlled by the user program. For example, as part of job initialization, the user can specify the approximate number of documents to be stacked in each pocket before a document is fed from the merge hopper to that pocket. The 3890 maintains a document count for each pocket. The merge function eliminates the need for programmed pocket lights. Limitations: Does not permit the 3890 to function as a collator.

Logic and Control Section: Is initialized by the processor when on-line and by a removable disk when offline. Initialization determines the fields to be read, length of the fields, starting number for the item numbering feature, merge feed controls, whether image processing is to be performed, the stacker control instruction algorithm to be used, endorser requirements, and whether the symbol error correction option is to be used. With the symbol error correction option, the 3890 performs extensive logical analysis to determine whether unreadable symbols can be replaced by internally generated field-defining symbols. The 3890 performs all stacker select determinations independent of processor control and transfers blocked data records to the processor. Due to the logical capability, the following functions are standard "programmable": split field, self-check number verification, multiple column control, base number conversion for fine sorting.

Stackers: Each pocket holds approximately 800 to 1,000 documents. The operator can unload all but the last 200-300 documents without stopping the 3890. Pocket warning lights alert the operator when a specific pocket is becoming full. The reject stacker is the first stacker -- the stacker closest to the input hopper. Racks for output trays are above each stacker.

Documents: CMC7 (coded magnetic characters with seven bars) characters and print quality must meet the specifications recommended by ECMA (European Computer Manufacturers Association) or ISO (International Standards Organization). E13B magnetic characters, print quality, and codeline arrangement on the documents must meet the specifications recommended by the American Bankers Association or the Committee of London Clearing Bankers. Intermixed paper and card documents within the following specifications can be processed.

- Length: 123 to 223mm (4.85 to 8.75 in.).
- Width: 70 to 106mm (2.75 to 4.17 in.).
- Thickness: 0.064 to 0.178mm (0.0025 to 0.007 in.). Carrier documents containing mutilated documents with a total thickness up to 0.356mm (0.014 in.) will also be transported.
- Basis Weights: 60 to 165 grams per square meter, 16 to 44 pounds (basis weight is the weight of 500 sheets of 17" x 22" paper)
- Grain: grain long or grain short, except for 16 pound paper, which must be grain long.

Publications: "IBM 3890 Document Processor, General Information Manual", GA24-3602.

SPECIFY

- (Canada only > Power (AC, 3-phase, 4-wire, 60 Hz): #9903 for 208V, #9905 for 230V; must be consistent with system voltage.<)
- (Except Canada > Power (AC, 3-phase, 4-wire):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
235V #2818	230V #9905
380V #2816	
408V #2819<)	

- Color: #9041 for red, #9042 for yellow #9043 for blue, #9046 for white.
- Upending Kit #9840, if required.
- Note: Loan basis; remains property of IBM.
- Cabling: #9181 for on the floor.
- Recognition: #2742 for E13B; #2741 for CMC7.
- Machine Nomenclature:

English #2927	Italian #2932
French #2928	Spanish #2931

- SS2 Transmission Option: #9666. Codeline SS2s are not treated as field-defining symbols. Before specifying, refer to: "IBM 3890 Document Processor, Machine and Programming Description Manual", GA24-3612. "IBM 3890 Document Processor Mdl E Machine and Programming Description Manual", GC31-0507. Field Installation: Yes.
- Tool Kits: Required for CE maintenance. For Rental Customer: Specify on first 3890 order for a customer. If required for a multiple machine installation, additional Tool Kits are available via a no-charge MES. For Purchase Customers: Specify on each 3890 machine order. When installed rental 3890s are purchased, a Tool Kit is to be ordered on a no-charge MES for each machine. Specify: #9766 for base machine, #9767 for Microfilming (#5111), #9769 for Item Numbering (#4551), 9770 for Endorsing (#3651).

Note: For mdl E and F purchased machines only, Microfilming (#9767), Item Numbering (#9769), and Endorsing (#9770) are shipped automatically.

SPECIAL FEATURES

Endorsing (#3651): Provides the capability of printing a full endorsement on the back of each document. During run initialization, the user specifies whether endorsing is active, and one of three horizontal print positions. Vertical location of endorsement is specified by the customer and is normally set at the plant. The design of the endorser facilitates operator changing of endorser legends for users who have a requirement to print different endorsements. The date portion of the endorser is set by the operator. Specify: #9167 for endorsement at top or #9168 for center. Color of endorser ink to be used: #9145 for black, #9147 for purple. Field Installation: Yes.

Item Numbering (#4551): Provides the capability of printing an eight-digit number on the back of each document. The starting item number and one of three locations is determined by the user program at initialization. The number can be incremented on any document cycle based on the user-provided Stacker Control Instructions parameters for the run. The number can be configured by the user at installation to be a combination of batch and serial numbers, or serial number only. Vertical location of the item num-

ber is specified by the customer and is normally set at the plant. Specify: #9379 for item number at bottom or #9378 for center. Field Installation: Yes.

Microfilming (#5111): Standard on mdl E. Optional feature on 3890 mdl A. Provides the capability of microfilming items, either front and back (duplex) or front only (duo), being processed on the 3890. Items are selectively filmed under program control at 3890 document speeds. An 8-digit number can be exposed on the film for every other document image filmed. The 8 digit positions can be split into two number fields, which can be incremented or reset on any document cycle under stacker control instruction parameters for the run. During run initialization, the user specifies whether microfilming is active, the mode of filming, and the starting 8-digit number. A frame mark is recorded on film for each document image for image counting during retrieval. The camera provides a reduction ratio of 50 to 1 and a resolution of 120 lines per millimeter. The film is advanced by a capstan drive system based upon the document width to maximize the use of film. The film cassette, a purchase-only item (see "Accessories"), provides space for take-up of the film as well as the film supply. Capacity of the cassette is 2,000 feet of .0027" polyester thin base film. Loading and unloading of film from the cassette into the film transport are automatic under operator control. Approximately 380,000 front and back images of an average intermix of documents can be recorded on 2,000 feet of film. The film is spaced six in. every 215 feet to facilitate splicing; if a 49-inch space is required, specify #9177. The film to be used is 16mm unperforated thin base microfilm which must be ordered on cores. Disclosure specifications covering the film, cassette, and core on which the film must be wound, are available from: Manager, Industry Relations. Field Installation: Yes.

S/370 and 4300 Attachment (#6370): Standard on 3890 mdl E. Optional feature on 3890 mdls A. Permits attachment to any virtual storage S/370 processor (except 3115 and 3125) or a 4300 processor via the byte multiplexer or block multiplexer channel. This feature is required on each 3890 attached to a S/370 or a 4300 processor. Maximum: One per 3890. Field Installation: Yes.

MODEL CONVERSIONS

Field installable.

ACCESSORIES

Microfilm Cassette (P/N 2647900): The film cassette provides space for film take-up as well as supply. Capacity is 2,000 feet of 0.0027-inch polyester thin-base film. The cassette must be loaded in a dark room. Disclosure specifications covering the film, cassette and core on which the film must be wound are available from Manager, Industry Relations, Japan.

SUPPLIES (NONE)

3979 EXPANSION UNIT

PURPOSE

The 3979 Expansion Unit provides the auxiliary device ports for the attachment of up to three input-output graphic devices to the 3179-G/3192-G. It is attached only to the 3179-G/3192-G Color Graphic Display Station.

MODELS

Model 1 001: The Expansion Unit provides for the attachment of the 5277 Mouse, 3852-2 Color Printer, and the 6180-2, 6184, 7371 or 7372 Color Plotters.

The 3979 attaches to the logic element of the 3179 model G, 3192 model G Color Graphics Display Station.

Prerequisites: A 3179-G or 3192-G Color Graphics Display Station is required for attachment of the 5277 Mouse or the 6180-2, 6184, 7371, 7372 Color Plotters via the 3979.

Note: Specify IEEE-488 interface #9920 for the 7371 or 7372. Specify IEEE-488 interface #5050 or #5060 for the 6184. Specify plotter attachment cable #5040 for all plotter attachments.

Customer Setup (CSU): Yes.

HIGHLIGHTS

- Provides attachment of graphic input/output devices to the 3179 model G, 3192 model G.
- Low-profile unit with positioning guides for convenient stacking beneath the 3179 model G, 3192 model G logic unit.

Cables: A 240mm (9.5 in.) cable is provided to attach the 3979 to a 3179 model G, 3192 model G logic unit.

Power and Line Cord: 100-127V AC, 1-phase, 3-wire, 50-60 Hz, or 200-240V AC, 1-phase, 3-wire, 50-60 Hz 2.8m (9.0 ft.) line cord with non-locking plug.

Customer Responsibilities:

- Adequate site, system and vendor preparation
- Receipt at customer's receiving dock, unpacking and placement of the unit
- Physical set-up, connection of cables in customer access area, switch settings, and checkout
- Performing Customer Problem Analysis and Resolution (CPAR)

Warranty: Three months. Terms and Conditions of the 3979 warranty are different by country. Contact your IBM marketing representative for the warranty applicable in your country.

Maintenance: The following maintenance services are available for an annual charge:

IBM On-Site Exchange
Customer On-Site Exchange
Customer Carry-In Exchange

Not all service options are available in each country. Contact country Service Department for available service options.

MACHINE ELEMENTS

Machine elements can be ordered to provide individual elements as needed by the customer in the use of the 3979 Expansion Unit.

Order Entry: For shipment, specify Machine Element (P/N) at time of order entry.

Order individual workstation elements through the Telemarketing Representatives.

Site Planning and Preparation: The customer should have on hand, or should order the "IBM 3179-G/3192-G Color Graphics Display Station Description", GA18-2261 for site planning and preparation work.

Warranty: Three months.

Terms and Conditions of the 3979 Expansion Unit warranty are different by country. Contact your IBM marketing representative for the warranty applicable in your country.

Maintenance: Maintenance for an individual element is only available on an hourly service basis at an IBM Repair Center or through an IBM Service/Exchange Center. Hourly service basis at the applicable hourly rates and terms apply. Maintenance for elements is different by country. Contact country Service department for the available maintenance in your country.

Expansion Unit and Line Cord can be ordered as follows:

Machine Element (6 ft.)	P/N	
Expansion Unit	6342060	Low voltage countries
Expansion Unit	6342061	High voltage countries
Line Cord	6952353	Brunei, Malaysia, Singapore, Hong Kong
Line Cord	6952317	Afghanistan, Indonesia, Surinam
Line Cord	6952308	Australia, New Zealand
Line Cord	6952371	Chile
Line Cord	6952285	Argentina, Paraguay, Uruguay
Line Cord	6952297	Bahamas, Barbados, Bermuda, Bolivia, Canada, Columbia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Guatemala, Guyana, Haiti, Honduras, Jamaica, Japan, Korea, Mexico, Netherlands Antilles,

MACHINES

Line Cord	6952344	Nicaragua, Panama, Philippines, Taiwan, Trinidad Bangladesh, Burma, Sri Lanka
Line Cord	6952347	Peru, Thailand, Venezuela

Prices: For all local charges, contact your country financial organization.

Customer Responsibility for Damaged or Altered Elements: Determination by IBM that damage to replaced units is due to causes or conditions not covered under the terms and conditions of the Purchase or Maintenance Agreement and the repair of that damage or replacement of missing, altered or non-IBM parts will be charged for at IBM's then applicable hourly service rates and terms. Altered elements will not be eligible for exchange or replacement services.

Customer Engineer On-Site Assistance: If the customer desires assistance in performing CPAR, the customer calls the local IBM service branch office. IBM will assist the customer on-site in performing CPAR procedures using the same documentation that is available to the customer.

Publications

- IBM 3979 Expansion Unit Setup Instructions (GA18-2272) low-voltage countries.
- IBM 3979 Expansion Unit Setup Instructions (GA18-2349) high-voltage countries.
- IBM 3192-G Color Graphics Display Station and IBM 3979 Expansion Unit Setup Instructions, (GA18-2590).
- IBM 3179-G/3192-G Color Graphics Display Station Description, (GA18-2589)

- IBM 3179-G/3192-G Color Graphics Display Station Operator Reference and Problem Solving Guide, (GA18-2591).

The applicable setup instructions are shipped with each unit.

The following publications contain supplemental information: They can be ordered from country publication centers.

- IBM 3179-G Color Graphic Display Station Description (GA18-2261)
- IBM 3179 Color Graphic Display Station Operator Reference and Problem Solving Guide, (GA18-2271)

SPECIFY (NONE)

CUSTOMER REPLACEMENT PARTS

The following part is not covered by an IBM maintenance agreement and must be purchased by the customer when replacement is needed.

Order from Country Telemarketing Representative.

Field Packaging Material For Expansion Unit	6316868

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

3990 STORAGE CONTROL MODELS 1, 2, 3

PURPOSE

The 3990 family of storage controls replaces the 3880 Storage Control Models 3 and 23. The 3990 offers improved environmental factors, price/performance, service, and function over the previous 3880 family. The 3990 is available in six models - two without cache and four with cache. Five of the models offer 4-path access to the new 3380 Enhanced Subsystem DASD.

All models attach to the new 3380 Models AJ4, BJ4, AK4, and BK4, as well as most of the older 3380 Models AA4, B04, AD4, BD4, AE4, and BE4.

The Model 3 provides all the functions of the 3880 Model 23 plus Cache Fast Write, up to 4.5Mb/sec. transfer rate on 3090 4.5M bps channels, larger cache sizes, and improved internal caching algorithms as basic cache functions. In addition, the Model 3 provides the Extended Functions, DASD Fast Write and Dual Copy.

MODELS

Provides two or four control unit paths, called storage paths, for 3380 direct access storage.

Model 1 001: Each of the two storage paths provides for attachment of 3380 AA4s/AD4s/AE4s/AJ4s/AK4s (see M3380 pages). Storage Control 2-path, no cache

Model 2 002: Each of the four storage paths provides for attachment of 3380 AA4s/AD4s/AE4s/AJ4s/AK4s (see M3380 pages). Storage Control 4-path, no cache

Model 3 003 (G03, J03, L03, Q03): Cache with four storage paths that provide for attachment of 3380 AA4s/AD4s/AE4s/AJ4s/AK4s (see M3380 pages). Model G03* - Storage Control 4-path, 32Mb cache. Model J03* - Storage Control 4-path, 64Mb cache. Model L03* - Storage Control 4-path, 128Mb cache. Model Q03* - Storage Control 4-path, 256Mb cache.

* Referred to generically as the Model 3

Hardware Requirements: Attaches to a 3090, 3084, 3083, 3081, 9370, and 4381 processor via 3.0 or 4.5M bps (3090 only) block multiplexer data streaming channel.

Software Requirements

MVS Environment: MVS support for the IBM 3380/3880/3990 Storage Subsystem is provided by MVS/XA DFP Version 2 Releases 2.3 and 3.0, MVS/XA DFP Version 1 Release 1.3, MVS/370 DFP Version 1 Release 1.2 and PTFs to MVS/SP Versions 1 and 2. These releases and PTFs provide device support for 3990 Models 1 and 2, 3990 Model 3 basic cache function, the 3380 Model CJ2 and 3380 J and K Models (including connection to 3880 Models 3 and 23). ICKDSF Release 9.0 and EREP Version 3 Release 3.2 are also required. Related IBM software products providing device support include DFDSS, DFHSM, DFSORT, ISPF/PDF and IMS.

DFP support for 3990 Model 3 extended functions, dual copy and DASD fast write, will be available in a future release of MVS/XA DFP. An Early Support Program for these extended functions will begin in 4Q 1988.

VM Environment: VM support for the IBM 3380/3880/3990 Storage Subsystem is provided by programming enhancements to VM/SP Releases 4 and 5, VM/SP HPO Releases 4.2 and 5 and VM/XA SF Release 2. These enhancements provide CP, CMS and guest device support for 3990 Models 1 and 2, the 3380 Model CJ2 and 3380 J and K Models (including connection to 3880 Models 3 and 23, except VM/SP does not support the 3880 Model 23). This device support will also be provided in VM/XA SP Releases 1 and 2. ICKDSF Release 9.0 and EREP Version 3 Release 3.2 are also required, and device support is provided for VM/IPF via PTF.

It is IBM's intent to provide basic cache function support for the 3990 Model 3 in a release of VM/SP HPO in 1988 and a release of VM/XA SP in 1989.

The above statement is being made for planning purposes only and does not represent a firm commitment to deliver the product or to deliver the product by the specified date.

Highlights for the VM programming enhancements include the following:

- A new DASD migration command (MIG3380) may simplify the process of moving data between different 3380 Models (applies to VM/SP and VM/SP HPO only.)
- Device contingent connection allows operations to continue for other DASD units when a 'unit check' for one device has not been cleared.
- The CP FORMAT utility provides a 'check/nocheck' option to control read-back checking while formatting DASD devices.
- The CP TRACE command provides the option to trace virtual sense data at a user console or printer.
- Virtual I/O will allow guest use of the new CCW commands introduced by 3990 Models 1 and 2 support.
- Support is provided for 3990/3380 CJ2 service information messages (SIMs).

VSE Environment: VSE support for the IBM 3380/3880/3990 Storage Subsystem will be available 4Q87 in the then current refresh level of VSE/SP Version 2 and 1Q88 in the then-current refresh level of VSE/SP Version 3. Device support will be provided for 3990 Models 1 and 2, the 3380 Model CJ2, and the 3380 Model J, including connection of the 3380 Model J to the 3880 Model 3.

It is IBM's intent to provide support for the IBM 3380 Enhanced Subsystem Model K in VSE/SP Version 3 in 1988.

The above statement is being made for planning purposes only and does not represent a firm commitment to deliver the product or to deliver the product by the specified date.

TPF Environment: TPF support for the IBM 3380/3880/3990 Storage Subsystem is provided in the enhancement to TPF Version 2 Release 3 announced March 17, 1987. This enhancement provides device support for 3990 Models 1 and 2, the 3380 Model CJ2, and the 3380 J and K Models, including connection of the 3380 Models J and K to the 3880 Model 3. TPF support for these devices is provided for single uniprocessor environments.

Limitations: 3990 Model 3s operating at 4.5M bps on a 4.5M bps channel must precede all other storage controls on that channel in the order of physical channel cabling. It is recommended that all other 3990 models precede all other type model storage controls on all channels. The new 3990 Storage Control supports all models of the 3380 except 3380 Standard A04 Models, those AA4 Models with serial numbers between 10001 and 14999, and the 3880 Model CJ2.

Maximum Configuration: The following summarizes the various DASD A unit configuration choices.

Column 1	Column 2
2-Path A Units	4-Path A Units
-----	-----
3380 Standard A Unit (AA4) (except serial ranges 10001 to 14999)	Two 3380 Enhanced Subsystem A Units (AJ4 or AK4) (Two #9433)

3380 Extended
Capability A Unit
(AD4 or AE4)

3380 Enhanced
Subsystem A Unit
(AJ4 or AK4)
(#9432)

3990 Model Configurations

Model 1

Configure up to two A units in any combination from Column 1 of the preceding figure. The same choice may be picked twice. The maximum configuration of two A units and 6 B units (3 B units per A unit) is 32 devices - the maximum allowable under a Model 1.

Model 2/Model 3 - Single Frame

Configure up to four A units from Column 1 or Column 2 or both in any combination (remember each choice in Column 2 is two A units) from the preceding figure except that 3380 Enhanced Subsystem A Units with features #9432 (2-path) and #9433 (4-path) can not be attached to the same storage control unit. Any choice may be repeated. The control unit is capable of addressing 64 devices. Maximum configurations are described in the following list.

- Four choices from column 1, each A unit fully configured with three B units.
- Two choices from column 2, each A unit fully configured with three B units.
- One choice from column 2 and two choices from column 1, each A unit fully configured with three B units but note restriction against intermixing features #9432 (2-path) and #9433 (4-path) on 3380 Enhanced Subsystem models.

Model 2/Model 3 - Dual-Frame

The Dual-Frame configuration option may be treated as two logical single frame configurations. The logical single frame is physically made up of two clusters, one in each of the two physical frames. Configure each logical single frame using the preceding rules. The two logical single frames do not need to have symmetric DASD configurations.

Note: Model 2 can only be dual-framed with another Model 2, a Model 3 can only be dual-framed with another Model 3.

Customer Setup (CSU): None.

HIGHLIGHTS

The 3990 family of storage controls provides:

- 4-path access for performance, availability, and the capability of non-disruptive DASD installation of Enhanced Subsystem DASD (Models 2 and 3 only).
- Support for most commonly available 3380 DASD types for configuration flexibility.
- Upgradeability from the 2-path 3990 Model 1 to the 4-path Model 2 to the cached Model 3.
- Improved reliability, availability, and serviceability through power and maintenance boundaries, remote maintenance capability, backed by a 12-month warranty.
- Improved environmental factors; less power, less heat, less floor space than the 3880s with equivalent paths.
- Improved cache functions of the Model 3 offering:

- Larger cache sizes from 32Mb to 256Mb of IBM produced one megabit Dynamic Random Access Memory for high performance data access with low cost and high availability
- Cache - Host transfers at speeds up to 4.5M bps, when connected to 3090 processors with 4.5M bps channels, improving performance and lowering channel overhead
- With DASD Fast Write, written data will exhibit comparable performance benefits as does read data
- With Dual Copy, key system or application volumes may be duplicated to minimize system outages

Standard Features:

- 4-channel switching
- Two-path DASD access (3990 Model 1)
- Two or Four-path DASD access (3990 Models 2 and 3 only)
- DASD Fast Write (Model 3 only)
- Dual Copy (Model 3 only)
- Cache Fast Write (Model 3 only)
- Read Track Command

DESCRIPTION

Physical Specifications

Width - 1,124mm (44.25 in.)
Depth - 813mm (32 in.)
Height - 1,791mm (70.5 in.)
(Canada only >

- 3990 Model 1
Weight - 318kg (700 lbs)
- 3990 Model 2
Weight - 381kg (840 lbs)
- 3990 Model 3
Weight - 544kg (1,200 lbs) <)
- (Except Canada > 3990 Model 1
Weight - 386kg (850 lbs)
- 3990 Model 2
Weight - 449kg (990 lbs)
- 3990 Model 3
Weight - 612kg (1,350 lbs) <)

Operating Environment:

Temperature: 16 to 32C (60 to 90F)
Relative Humidity: 20 to 80 percent
Wet Bulb: 23C (73F)

Publications:

The following publications are shipped with the product:

- Maintenance Information Volume A01
- Maintenance Information Volume A02
- Maintenance Support Volume A03 (Microfiche)
- Parts Catalog Volume A05 (Microfiche)

The following publications are available from the European Publications Centre (EPC) immediately:

- GA32-0098 IBM 3990 Storage Control Introduction
- GC22-7064 IBM System/360 System/370 4300 Processors Input/Output Equipment Installation Manual - Physical Planning
- GC35-0101 Cache Device Administration

The following manual will be available in 4Q, 1987.

- GA32-0100 IBM 3990 Storage Control: Planning, Installation, and Storage Administration Guide

The following manual will be available with the availability of the VM software.

- GC24-5372 Virtual Machine IBM 3990 Storage Control Models 1 and 2 and IBM 3380 Direct Access Storage Direct Channel Attach Model C2J

The following manual may be ordered at General Availability.

- GA32-0099 IBM 3990 Storage Control Reference

The 3990 Models 1, 2, and 3 provide high performance for large capacity IBM direct access storage devices. These models provide the latest technology and design. They offer improved attachment flexibility, price/performance, capacity, function, and reliability. The 3990 attaches IBM 3380 DASD products - 3380 Standard Models AA4, B04, 3380 Extended Capability Models AD4, AE4, BD4, BE4, and the newly-announced IBM 3380 Enhanced Subsystem Models AJ4, AK4, BJ4, BK4. The 3990 is supported by MVS/XA, MVS/370, TPF, VM/SP, VM/SP HPO, VM/XA SP, VM/XA SF, and VSE operating systems. Operating system support will vary by 3990 model and function. See the IBM 3380 Direct Access Storage Enhanced Subsystem Models AJ4, BJ4, AK4, and BK4 announcement letter for the specific software environments supporting the 3990 Storage Control models and functions. 3380 Model AA4s with serial numbers 10001 to 14999 are not supported, neither is the 3380 Model A04. The 3990 Models 2 and 3 have twice the attachment capability of a 3380. The 3990 supports 3380 Standard Models AA4 and B04; 3380 Extended Capability Models AD4, AE4, BD4, and BE4 with Device Level Selection (DLS) support mode (two-path access); and Enhanced Subsystem Models AJ4, AK4, BJ4, and BK4 with Device Level Selection Enhanced (DLSE) support mode (four-path access) or DLS support mode (two-path access). The 3990 Models 2 and 3 allow the intermix of 2-path strings headed by AA4, AD4, or AE4 units with 4 path Enhanced Subsystem DASD. The 3990 Model 1 is only capable of 2-path access.

The 3990 is available in models containing either one or two storage clusters. Each cluster has two data paths and four or eight CPU channel interfaces. In addition, each cluster has independent power (the AC power to the unit is shared in two cluster models) and cluster support facility. The cluster support facility includes a support microprocessor, diskette drive, and operator panel. Each cluster is designed such that it can be operated and serviced independently of the other cluster. Model 1 consists of one storage cluster and the Models 2 and 3 consist of two storage clusters. Each cluster contains two internal data paths from attached devices to CPU channel interface. The Models 2 and 3 can support four concurrent data transfer operations, in contrast to the 3380, which supports only two.

New with the 3990 is the Read Track command, which provides improved performance for IBM DFDDSS and fixed length data transfer operations of IBM DFSORT by transferring all records from a device track without first having to determine the number of records on the track or having to clear storage prior to reading tracks. The combination of the ability to read any track format and the placing of an "end-of track" identifier in storage, reduces CPU time required for IBM DFDDSS.

The 3990 Model 2 also offers significant environmental improvements. A Model 2 (four paths) requires only 35 square feet of floor space including service access, as opposed to 105 square feet for two 3380 Model 3s (four paths), almost a 70 percent reduction. The power requirement of a Model 2 is a little more than half that of two 3380 Model 3s. A Model 2 puts out about 40 percent less heat than two 3380 Model 3s.

Cache Storage Control Models: The Model 3 is available in cache sizes of 32, 64, 128, and 256Mb of randomly-accessed electronic storage and uses the one megabit chip dynamic random access memory (DRAM) technology. The Model 3 dynamically manages the contents of the cache by a Least Recently Used (LRU) algorithm to maximize the high speed cache accesses in the DASD subsystem.

Cache - Host transfers can occur at speeds up to 4.5 Mb/second on 3990 Model 3s when connected to IBM 3090 processors with 4.5 Mb/second channels. Direct cache to host transfers occur on read hits and, if DASD fast write or Cache fast write is being used, on write hits. Read and write misses operate at DASD speed.

The Model 3 provides a cache fast write function that offers high performance for temporary data. For this type of data, direct DASD accesses may be eliminated if there is sufficient cache space to hold this data during its life.

A cached Model 3 (four paths) requires only 35 square feet of floor space including service access, as opposed to 105 square feet for two 3380 Model 23s (four paths), almost a 70 percent reduction. The power requirement of a Model 3 is almost half that of two 3380 Model 23s. A Model 3 develops about half the heat of two 3380 Model 23s.

The Model 3 provides as basic functions all the functions of the IBM 3380 Model 23 plus Cache Fast Write, improved RAS, improved performance, larger cache sizes, and improved internal caching algorithms. In addition, the Extended Functions, DASD Fast Write and Dual Copy, are provided.

Nonvolatile Storage: The Model 3 incorporates a Nonvolatile Storage (NVS), which provides 4Mb of storage with battery backup. The 4Mb NVS provides up to 48 hours of battery back-up with the battery fully charged. The Extended Function enabled by NVS includes Dual Copy and DASD Fast Write.

Dual Copy: The 3990 Model 3 utilizing Dual Copy provides increased data availability with increased performance over non-cached DASD by maintaining two copies of key DASD volumes and providing dynamic switching to the secondary or back-up copy in the event of failure in accessing the primary volume. Also, a permanent data error on a portion of the primary volume is recoverable by rereading the copy of the data from the secondary volume. The failed primary track can then be recovered later. Although control unit overhead to maintain two copies of data is increased, the combination of dual copy and DASD fast write offers improved subsystem performance over the predecessor cache product - the 3380 Model 23.

DASD Fast Write: DASD Fast Write extends the benefits of cache performance to writes as well as reads. DASD Fast Write also provides improved performance for dual copy while still providing two copies of data. With DASD Fast Write, customers no longer need to concern themselves with read-to-write ratios as they did with the 3380 Model 23, thus making pre-installation analysis easier. DASD Fast Write simultaneously writes to cache and to NVS, disconnects from the channel, and asynchronously writes to DASD using internal algorithms. With use of DASD Fast Write, new candidates for caching include IMS message files, IMS and DL/1 logging volumes, and other volumes with substantial write activity.

RAS Features: The 3990 Storage Control family offers improved reliability, availability, and serviceability as compared to the 3380 Storage Control. The 3990 family comes with a 12-month warranty. The 3990 provides improved RAS due to:

- The capability of non-disruptive installation of 3380 Models BJ4 and BK4 and the second pair of AJ4s or AK4s on Models 2 and 3 in four-path configurations.
- Concurrent maintenance improvements that minimize repair actions that cannot be performed concurrently with normal operation on the Models 2 and 3.
- Improved failure isolation that captures error data at the time of failure and identifies the failing Field Replaceable Unit(s) (FRUs).
- Minimizing single points of failure.
- Improved error reporting is provided through Service Information Messages (SIM). The operator is notified by the operating system when a failure has been detected; the scope of the failure; a code to give to the service organization that tells what replacement parts to bring; and what part of the system will be unavailable while the repair is being effected.

Support processors, one per cluster, provide support for the following RAS enhancements:

- A microcode patch area prevents the loss of microcode patches in power down situations.
- Outboard error logging, a stand alone error analysis feature, reduces problem determination time by writing error data to the diskette and creating a consolidated failure record.
- A remote maintenance facility provides the capability of remote diagnostic communication with the Support Center for storage control problems.

Improved system availability is provided by minimizing single points of failure that lead to loss of access to data. This is accomplished by:

- Separate power boundaries, one per cluster
- In Model 3s, separate power boundaries each for cache and nonvolatile storage
- For Model 3 cache storage, single and double-bit error detect and correct, triple-bit error detect, soft error correct

Dual Frame: To ensure even greater data availability, Models 2 and 3 offer a Dual Frame Configuration capability, which interconnects two 3990 models such that paths to a DASD string are split across frames. The dual frame configuration ensures that if one storage control is unavailable, then the associated disk drives are still addressable by the other half of the dual frame storage control unit. There is no single point of failure except room power.

Dual frame configurations are formed by abutting two Model 2s, or two Model 3s, together. The channel switching features of the two boxes to be dual framed must be identical. The Model 3s need not have identical cache sizes.

Performance: The following performance information has been derived from analytic models. This technique has been tested with success in predicting performance of prior products both cached and non-cached. The model used in this section predicts subsystem performance in terms of response time in milliseconds versus throughput in start I/Os per second. Hit ratios for cache runs are generated by extrapolating hit ratios seen on current cache devices to the larger cache sizes of the 3990 Model 3.

The following statements summarize the performance gains of the 3990 versus the 3880 in a MVS/XA environment. The 3880s have 3380-E DASD in 2-path connect mode on 3.0M bps channels. The 3990 Models 2 and 3 are connected to 4-path 3380-K DASD. The 3990 Model 3 is operating on a 4.5M bps channel. The total arms are equal (32 E actuators vs. 32 K actuators). The data on the 3380-E actuators has been placed directly on the 3380-K actuators. In this comparison two 3880s are compared with one 3990, the number of directors or paths (4) are equal.

- The 3990 Model 2 can provide up to 30 percent greater throughput than two 3880 Model 3s at 22ms response time.
- The 3990 Model 3 can provide up to two and a half times the throughput of a 3990 Model 2 at 22ms response time.
- The 3990 Model 3 using DASD Fast Write can provide up to three times the throughput of a 3990 Model 2 at 22ms response time.
- The 3990 Model 3 can provide up to two times the throughput of a 3990 Model 2 with a 45 percent reduction in response time.
- The 3990 Model 3 using DASD Fast Write can provide up to two and a half times the throughput of a 3990 Model 2 with a 45 percent reduction in response time.
- The 3990 Model 3 at 150 accesses per second can reduce response time up to 60 percent as compared to a 3990 Model 2.

3990 Model 1 Performance: For the following comparison of 3990 Model 1 and 3880-3, one control unit with 16 actuators of 3380-J and 16 actuators of 3380-D are used, respectively. The 3990 Model 1 can provide increased throughput of up to 10 percent above that of the 3880 Model 3.

Note: These estimates of performance are based on modeled data, not representative of all environments. Results for other installa-

tions, workloads, and environments will vary and must be assessed on an individual basis. Accordingly, these estimates do not constitute a performance guarantee or warranty.

SPECIFY

- Power Supply, specify one:

#9001 All 50 Hz (except Japan)
#9002 All 60 Hz (except Japan)
#2005 All 50/60 Hz (Japan only)

- Power for AC, 3-phase, 5-wire, 50 Hz (not Japan):

50 Hz
200V #2807
220V #2815
230V #2827
240V #2818
380V #2816
400V #2825
415V #2826

- Power (AC, 3-phase, 4-wire):

60 Hz
200V #2733
208V #9903
220V #2800
240V #9915

- Power (AC, 3-phase, 4-wire) (Japan only):

50 Hz
200V #2807
220V #2815
240V #2818

- Machine Nomenclature:

Brazilian (Portuguese) #2938
French Canadian #2935
Japanese #2930
Spanish #2931
UK English #2927
US English #2924

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.

- 3380 Model AA4 Support: Specify #9003 for each 3380 AA4 that is attached to a 3990.

Note: 3380 AA4s with serial numbers between 10001 and 14999 are not supported. Maximum: two on a 3990 Model 1; four on Models 2 and 3.

SPECIAL FEATURES

Four Channel Switch, Add'1 (#8172): The Four Channel Switch, Add'1 Feature allows up to eight channels to access a cluster in a 3990 storage control unit. A different set of eight channels may be attached to the other cluster (Model 2 or Model 3) in that storage control unit. Order one for a 3990 Model 1; order two for all other models.

If this is being added to a machine that has either #6149 or #7149 installed then feature codes #6150 or #7150 must be ordered, respectively. Maximum: Two Field Installation: Yes. Prerequisites: None.

Remote Switch Attachment For Four-Channel Switch (#6149): Removes the four enable/disable switches provided per cluster by the Four-Channel Switch from the 3990 operator panel and allows them

to be relocated to a remote configuration control panel. Order one for a 3990 Model 1; order two for all other models. If feature #8172 is installed or ordered, then feature #6150 must be ordered in addition. Maximum: Two. Field Installation: Yes. Prerequisites: None.

Remote Switch Attachment For Four-Channel Switch, Add'l (#6150): Removes the four additional enable/disable switches provided per cluster by the Four-Channel Switch, Add'l (#8172) from the 3990 operator panel and allows them to be relocated to a remote configuration control panel. Order one for a 3990 Model 1; order two for all other models. Maximum: Two. Field Installation: Yes. Prerequisites: #8172, #6149.

Local Remote Switch Attachment For Four-Channel Switch (#7149): Four switches per cluster can be enabled/disabled from the 3990 operator panel or from a remote configuration control panel. Order one for a 3990 Model 1; order two for all other models. If feature #8172 is installed or ordered, then feature #7150 must be ordered in addition. Maximum: Two. Field Installation: Yes. Prerequisites: None.

Local Remote Switch Attachment For Four-Channel Switch, Add'l (#7150): Four switches, add'l per cluster can be enabled/disabled from the 3990 operator panel or from a remote configuration control panel. Order one for a 3990 Model 1; order two for all other models. Maximum: Two. Field Installation: Yes. Prerequisites: #8172, #7149.

MODEL CONVERSIONS

3990 machines that can be field model converted are:

- 3990 Model 1 can be field model converted to a 3990 Model 2.
If the 3990 Model 1 has special features #8172, #6149, #6150, #7149, or #7150 installed then these features must be ordered once more for the upgrade.
- 3990 Model 2 can be field model converted to a 3990 Model 3.
- 3990 Model 3 Models can be field model converted to a 3990 Model 3 Model with a larger cache storage size.

A purchased upgrade may be applied only to a purchased storage control unit; a rental (MRC) upgrade may be applied only to a rental (MRC) storage control unit.

Parts removed or replaced when field model converting a machine become the property of IBM.

ACCESSORIES (NONE)**MACHINE ELEMENTS (NONE)****SUPPLIES (NONE)**

4055 INFOWINDOW DISPLAY

PURPOSE

The 4055 InfoWindow Display provides the ability to display both NTSC formatted composite video from a videodisc player and RGB formatted text and graphics from an IBM Personal Computer on its color display monitor. Dual stereo speakers contained within the 4055 provide audio output. Images from an attached non-IBM videodisc player and IBM Personal Computer can be presented individually or simultaneously through the use of an overlay technique. The user can control the presentation sequence through the use of a touch-sensitive screen or the computer keyboard.

MODELS

Model 1 001: InfoWindow Display

The standard model consists of a 13-inch color display monitor with touch screen, RGB cable, Personal Computer Graphics Sync cable, "Hardware Maintenance and Service Manual" with advance diagnostic diskette, Guide to Operations with system diskette, and a six foot power cord.

Prerequisites:

- IBM 4055 Control Program (P/N 8575139)
- IBM Personal Computer

Each 4055 must be attached to an IBM Personal Computer (5150), Personal Computer XT (5160), or Personal Computer AT (5170), with a minimum of 256K of memory and one dual-sided diskette drive configured as follows:

- 1501200 #1200 Enhanced Graphics Adapter
- 1501201 #1201 Graphics Memory Expansion Card
- 2720020 #5040 General Purpose Interface Bus (GPIB) Cable
- 6451503 #1503 General Purpose Interface Bus (GPIB) Card
- 8575146 #6583 Enhanced Graphics Adapter Jumper Card
- 6280057 #0057 DOS 3.2

Note: It is desirable that the Personal Computer have two diskette drives or one diskette drive and a hard disk if used for program development. Preparation of presentations may require additional memory.

The laser videodisc player is optional and is available from original equipment manufacturers (non-IBM). The videodisc player provides audio and still and motion video capabilities. The 4055 will accommodate attachment of one or two compatible videodisc players through the appropriate RS-232-C or IEEE488 interface. If two videodisc players are attached, they must be of the same make and model and be attached via the IEEE488 parallel interface.

The IBM BERMUDA Display has an interface capable of attaching the following non-IBM videodisc players or their functional equivalent:

Make/Model	Attachment Mode	
	RS-232-C PORT	IEEE488 PORT
Pioneer LD-V6000	X	
Pioneer LD-V6000 With SWSD Processor SS-D1	X	
Pioneer LD-V6200		X

Note: The appropriate cables are required to attach the videodisc player to the 4055. Cables for video and audio connections should be obtained from the videodisc player manufacturer. Consult the announcement letter for general availability schedules for one and two videodisc player support and support of the SS-D1 (sound over still) capability.

IBM Branch Office personnel in response to customer requests for additional interface specifications should contact IBM Corporate Industry Relations.

Customer Setup (CSU): The 4055 is designated customer setup thereby offering the customer early availability and relocation flexibility. Set-up procedures are included in the Guide to Operations which is shipped with each machine. A clear indication that the machine is operational will be given.

Programming Support: Operation of the 4055 is dependent upon the IBM InfoWindow Control Program (5875-MMM, #5139) and appropriate user applications development. Applications development programs for the 4055 are provided by Video/PASSage Multimedia Authoring System (5875-MMM, #3823) and Video/PASSage Multimedia Presentation System (5875-MMM, #3822).

HIGHLIGHTS

- **Video Control:** The 4055 contains a (0.31mm dot pitch) dual-frequency 13-inch color monitor capable of displaying both NTSC composite video and RGB text and graphic images. The monitor is capable of displaying text and graphics from the Personal Computer up to 640 x 350. The monitor can display video or overlay text and graphic images on NTSC composite video in low frequency mode (up to 640 x 200). Text and graphic images can be displayed up to 640 x 350 in high-frequency mode or 640 x 200 in low frequency mode. In each frequency, the monitor can display 16 digital (RGB) colors from a 64-color palette, and is capable of displaying 40 or 80 characters per line (25 lines).

The 4055 also includes ports for an auxiliary NTSC composite monitor and for an additional RGB monitor or projection screen.

Note: Applications being developed to utilize the optional attachment of a projection screen or RGB monitor should be designed to operate at a single frequency (15.75 or 21.85K Hz) due to limitations of currently available devices and to use any color for transparency except black.

- **Touch-Sensitive Screen Control:** The 4055 has a touch-sensitive screen with up to 60 variable-touch areas, which can be used as an input device. The application author can vary the touch area location, size of the touch area, and number of touch areas per screen within the above parameters. Touch inputs may be detected as X-Y coordinates from 0 to 255 or in row-column position corresponding to video text positions, or in 'key table' mode. In key table mode, up to 60 application defined keys (touch targets) can be loaded into the display logic with response to touch input indicating the key touched. An audio feedback can be programmed to provide an indication when a touch has been sensed by the display. By user response to the touch screen or keyboard, the presentation can be modified through pre-programmed options. User selections can be recorded for later tabulation.
- **Audio Control:** The 4055 contains dual stereo speakers and ports for an external stereo amplifier with speakers and for a set of headphones. If headphones are plugged into the available port, the integrated stereo speakers are disabled. The volume for the internal speakers or head phones may be adjusted via a control on the front of the display.

The audio card in the display contains a voice synthesis chip with 218 prerecorded words and sounds stored in ROM for playback of stored digital speech. Additional words can be read from a PC diskette or hard disk to extend the vocabulary. Words to be used for this 'external speech' function must be recorded, digitized, and stored by the user.

The optional videodisc player can provide the majority of pre-recorded audio needed for presentations. Audio from a

videodisc can be played over a still composite video frame when using a sound over still option provided by the videodisc player manufacturer. This still frame with sound capability allows the user to accompany one video frame with sound from the videodisc. Multiple frames may be used to extend the duration of the audio. Certain additional videodisc features may be required to support this capability.

Operating Environment:

Voltage: 120V AC Single-Phase, 3-wire, 60 Hz
Temperature: 15.6 to 32.2C (60 to 90 degrees F)
Humidity: 8 to 80 percent RH

Customer Responsibilities: The customer is responsible for:

1. Adequate site preparation and planning.
2. Receipt, unpacking and placement of the system.
3. Physical setup including the connection of cables between the display, IBM Personal Computer and optional non-IBM equipment (i.e., videodisc player) and initial test of the equipment.
4. Using and following the Problem Determination Procedures to diagnose a failing unit before calling IBM for service.
5. Providing a desk or table top or a suitable kiosk for the display and supporting units.
6. Acquiring a suitable non-IBM videodisc player if required, attaching cables, and ensuring delivery in time to install as part of the system.
7. Reviewing the recommendations in the "IBM InfoWindow Site Planning Guide" (GA27-3743) and insuring adequate access of the machine for repair by the IBM Customer Engineer. The customer is responsible for removing the machine from a kiosk if the kiosk does not provide adequate access to the machine by the IBM Customer Engineer.

Problem Determination: Problem Determination Procedures are provided with the 4055 to enable the customer to determine the failing unit (i.e., PC, InfoWindow Display, or Videodisc Player). The problem determination procedures are provided in the "4055 InfoWindow Display Guide to Operations". The problem determination procedures for the IBM Personal Computer are covered in its own documentation.

Publications: The following publications are available for the 4055 InfoWindow Display:

- GA27-3743 Site Planning Guide
- GX27-3671 IBM InfoWindow Guide to Operations (Shipped with each 4055 includes: Guide to Operations Text, Binder, Slip case, Tabs, Label Sheet, Diagnostic diskette (with plastic diskette holder))

- SX27-3665 IBM InfoWindow Hardware Maintenance and Service (Shipped with each 4055 includes: Hardware Maintenance and Service Text, Binder, Slip case, Advanced diagnostic diskette)
- G580-0689 IBM InfoWindow System (Executive Brochure)
- G580-0692 IBM InfoWindow System (Hardware Brochure)

A videodisc presentation entitled "Exploring the IBM InfoWindow System" (GV30-0169), consisting of a videodisc and diskettes designed to be run on the 4055, a Personal Computer XT or AT with 512K memory and a 10MB fixed disk and a compatible videodisc player, is available for customer information and demonstration. The purpose of the videodisc is to introduce the concepts of interactive videodisc technology, applications, and IBM hardware/software. This videodisc has been sent to all demonstration locations. Additional copies are available from Mechanicsburg.

See Personal Computer sections of the sales manual for appropriate Personal Computer publications.

SPECIFY

- (Canada only > Color: Standard color is pearl white for the front bezel and shell gray for covers.

SPECIAL FEATURES (NONE)**MODEL CONVERSIONS (NONE)****ACCESSORIES**

4055 Tilt and Swivel Adapter (P/N 8575140, #3660*): Allows vertical and horizontal adjustments to the 4055 InfoWindow Display. The tilt/swivel base allows for tilt angles of -5 degrees to 15 degrees from vertical and allows for rotation angles of +/- 180 degrees from centerline.

9-Foot Power Cord (P/N 6952300, #4770*): 9-foot power cord (a 6-foot power cord is standard).

* For shipment with the machine, use the feature number.

Accessories can be ordered for installed machines by specifying part number.

SUPPLIES (NONE) <

4201 PROPRINTER

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 4201 Proprinter is a serial wire-matrix impact printer that attaches to the 3192 mdl G or 3979 mdl 1 (when attached to the 3192-G only), IBM Personal Computers PC/AT/XT/XT370/AT370 Industrial Computer, Portable PC, 3270 PC (Control Program Version 1.2 and 2.0), 3270 PC/G, 3270 PC/GX, (Canada (English only) > and 3194 mdl H50 with #4899 - P/N 1614899, 3194 (except the mdl H50) with P/N 1525612, <) 3192 display station mdls C and D and 3197 display station mdls C and D. In addition, the 4201 is designed for hardware and software capability with certain non-IBM hosts. Attachment is via the parallel interface (standard) or asynchronous serial interface (optional) and attachment cable. (Non-IBM Personal Computers may require a different cable. Check with your IBM authorized dealer at point of sale for assistance.) Included with the 4201 Proprinter is one ribbon cartridge, continuous forms guide, a 1.8m (6 ft) power cord, "IBM 4201 Guide to Operations", service/exchange center form, and an inventory checklist. The 4201 is a customer set-up, purchase only product.

MODELS

Model 1 001: (No Longer Available) Includes integrated tractor and friction forms feeding with integrated front sheet feed for cut sheets and envelopes.

Limitations: Continuous Forms: Pinfeed continuous forms can be used.

Both edges of the pinfeed forms must be threaded through the tractor. No fasteners are permitted in the areas exposed to the printhead.

Printer Operation and print quality vary with paper and number of copies. Multipart forms should be tested in operating conditions to verify that results are satisfactory. The forms thickness lever must be varied to accommodate differing paper weight and thickness.

Paper Specifications: Maximum continuous forms paper width is 254mm (10 in.) --- Maximum print-line width is 203.2mm (8 in.).

Front Sheetfeed: Front sheetfeed is accomplished by hand insertion. One-part continuous feed paper can remain in the printer while you use cut forms or envelopes of the same or narrower width than the continuous forms.

Paper Width: Cut form - 76.2mm to 279.4mm (3 in. to 11 in.) --- Continuous forms - 76.2mm to 254mm (3 in. to 10 in.) --- Print standard 241.3mm (9 1/2 in.) wide envelope.

Paper Weights: Single part - 12-24 pound 0.0023 in. - 0.0045 in. thickness.

Multi-part forms: One- and three-part forms use 10 to 15 pound paper (0.0019 in. - 0.0023 in. thickness). Four-part forms use 10 to 12 pound paper (0.0019 in. - 0.0023 in. thickness). For multi-part forms, thickness must not exceed 0.014 in.

Paper over 24 pound must be tested for acceptable operation and legibility.

Non-IBM Hosts: The 4201 Proprinter attaches to the following non-IBM PCs via the parallel or the serial interface and the appropriate attachment cable.

These non-IBM personal computers have been tested with the IBM Proprinter by IBM using the indicated software with the following results. This does not imply lack of compatibility with other non-IBM personal computers that may not have been tested.

PC	DEGREE OF CAPABILITY	SOFTWARE PACKAGES	MODIFICATIONS
Compaq Deskpro	Compatible	Peachtext Multiplan	Parallel attachment without modification
Compaq Portable	Compatible	Peachtext Multiplan	Parallel attachment without modification
AT&T (Mdl 6300)	Compatible	Peachtext Multiplan	Serial attachment Parallel attachment without modification
Apple IIE Apple IIC	Full text No graphic	Appleworks	Serial attachment Apple Cable Normal print mode only

Customer Setup (CSU) and Responsibilities: The IBM 4201 Proprinter is designated a customer setup machine. The marketing representative must advise the customer of his/her responsibilities before receipt of the machine. Customer setup instructions are included in the "IBM Proprinter Guide to Operations".

HIGHLIGHTS

- Multiple speed serial impact printing
 - 200 cps DP mode
 - 100 cps text mode
 - 40 cps near letter quality mode

- Integrated front sheet feed for envelopes, cut sheet, etc.
- Document on demand - tractors below print line
- Up to four-part forms
- Drop in "clean hands" ribbon cartridge
- Integrated tractor and friction feed
- APA (all points addressable) graphics
- Maximum 203.2mm (8 in.) print line
- Program selectable line spacing 1/6, 1/8, 7/72, n/72, n/216*

* Printer recognizes n/216 in. spacing commands; the smallest individual line increment is 1/144 with corrections made every third print line to obtain apparent n/216 spacing.

- 76.2mm (3 in.) to 279.4mm (11 in.) wide paper can be used with the front sheet feed
- 76.2mm (3 in.) to 254.0mm (10 in.) wide paper can be used with the continuous forms feed
- Bottom of forms printing: 12.7mm (0.5 in.)
- IBM PC compatible parallel interface (standard)
- Optional asynchronous serial interface module - customer purchase and install
- Optional 5K print buffer - customer purchase and install

Physical Specifications:

Height - 133.4mm (5 1/4 in.)
Width - 419.1mm (16 1/2 in.)
Depth - 355.6mm (14 in.)
Weight - 7.94 KG (17.5 lb.)

SPECIFY

One asynchronous serial interface module option #3000 (P/N 6493187).

One 5K print buffer #4000 (P/N 6493188).

- (Canada only > Voltage (120V AC, 1-phase, 60 Hz); No specify required. Standard power cord is 1.8m (6 ft.). <)
- (Except Canada > Power: 220/230/240V AC, 1-phase, 50/60 Hz. No specify required.
- A 2.8m (9.2 ft) power cord is supplied with the machine. The Country will select a power cord plug to the specifications most commonly used in that country. See configurations for order information.<)
- Attachment cable (required to cable connect the 4201 Proprinter to IBM Personal Computer):
 - #5612 (P/N 1525612) for parallel IBM PC interface cable.
 - #6031 (P/N 8509386) for asynchronous serial attachment cable.
- Attachment cable (required to cable connect the 4201 Proprinter to the 3192 mdl G or 3979 mdl 1 (when attached to the 3192-G only)):
 - #2058 (P/N 6342058) for interface cable.
- Color: Pearl White only (no specify required).
- Language: English (no specify required).

SPECIAL FEATURES

Asynchronous Serial Interface, #3000 (P/N 6493187).

5K Print Buffer, #4000 (P/N 6493188).

MODEL CONVERSIONS (NONE)

ACCESSORIES

Attachment Cable: Required to cable connect the 4201 Proprinter to the host. Specify #5612 (P/N 1525612) for IBM parallel attachment 1.8m (6 ft). Specify P/N 8509386 for serial attachment 6m (19.5 ft). Specify P/N 6457008 for the attachment to 3192 display station mdl C and D and 3197 display station mdls C and D.

SUPPLIES

Ribbons: The IBM 4201 black fabric ribbon (P/N 6328829) or equivalent. None required with machine order.

4201 PROPRINTER II

PURPOSE

The 4201 Proprinter II printer is a high speed, near letter quality printer for attachment to IBM Personal Computers and compatible non-IBM PC hosts. The narrow carriage IBM Proprinter II includes the functions of the IBM Proprinter XL in addition to providing an alternate NLQ font and a fast 12-pitch draft speed. The Proprinter II is an enhanced replacement product for the Proprinter.

MODELS

Model 2 002

Limitations:

1. Continuous forms: Both edges of the pinfeed forms must be threaded.
2. Paper Specifications: Maximum paper width is 279.4mm (11.0 inches). Maximum pin-to-pin width for continuous forms is 254mm (10.0 inches). Maximum print-line width is 203.2mm (8.0 inches).
3. Single sheetfeed: Single sheetfeed is by manual front insertion.

Prerequisites: For parallel attachment, the IBM PC Printer Attach Cable (P/N 1525612, #5612) is required and must be ordered separately.

Customer Setup (CSU): The IBM Proprinter II is designated as a customer set-up (CSU) box. A customer "Guide To Operations Manual" is provided with this printer. CSU allowance is one day. IBM set-up service is available from the IBM National Service Division at IBM hourly service rates and minimums.

HIGHLIGHTS

- High Speed Printing
 - 200-240 cps (Fastfont) burst speed in draft mode
 - 40 cps in near letter quality mode
- Easy to Control Printing
 - Operator panel menu selection of print modes
 - User controlled quiet mode for DP printing
- Versatile Printing
 - Seven pitches (5, 6, 8.55, 10, 12, 17.1 cps, proportional)
 - 4K Standard Print Buffer
 - Double high printing
 - Alternate NLQII font (Courier 10/12 cpi)
 - All points addressable (APA) graphics
- Flexible Paper Handling
 - Continuous forms
 - Power assisted paper loading
 - Built-in variable width tractor
 - Document-on-demand for easy tear off of form just printed
 - Single sheets and forms
 - Convenient front sheet feed
 - Standard friction feed
- Easily installed, "clean hands" ribbon cartridge with a yield of three million draft mode characters.

DESCRIPTION

The IBM Proprinter II is a new member of the Proprinter family and attaches to IBM Personal Computers, to compatible non-IBM personal computers, and to certain displays. The printer offers three software or operator selectable burst print speeds of 40 cps (Near Letter Quality), 120 cps (Emphasized-Fastfont) and 240 cps (DP mode-Fastfont). Speed is dependent on the selected print mode and pitch. Graphics and text modes may be alternately used in the same document.

The IBM Proprinter II printer offers one-button selection of quality and quiet mode. In addition, the operator may use the printer setup mode to select Fastfont, double high printing, double wide printing, 12 or 10 of spi, condensed print, emphasized print, NLQ II font, or printer reset to initial defaults.

The 4201 Proprinter II uses the IBM 4201 Proprinter ribbon, a black fabric ribbon in a "clean hands" cartridge for easy installation.

The printer attaches to the IBM Personal Computer via the IBM PC printer attach cable. Attachment to other than the IBM Personal Computer may require a different cable.

An optional asynchronous serial interface and an optional 8K print buffer are also available.

The Proprinter II attaches to the following IBM Personal Computers:

- Personal Computer (5150)
- Portable Personal Computer (5155)
- Personal Computer XT (5160)
- Personal Computer XT Model 286 (5162)
- Personal Computer XT/370 (5160 Model 589)
- Personal Computer AT (5170)
- Personal Computer AT/370 (5170 Models 599, 739, 919, 939)
- RT Personal Computer (6150 and 6151)
- 3270 Personal Computer (5271) (DOS 2.1/3.1/3.2; CP 1.2.2/2.1/3.0)
- 3270 Personal Computer AT (5273) (DOS 3.1/3.2; CP 2.1/3.0)
- 3270-PC/G and GX (5371)
- 3270-PC AT/G and AT/GX (5373)
- IBM Personal System/2 Model 30
- IBM Personal System/2 Model 50
- IBM Personal System/2 Model 60
- IBM Personal System/2 Model 80
- IBM PC Convertible
- PCjr (4860)
- Displays
 - 3161, 3162, 3163, 3164
 - 3192 Models C, D (requires cable P/N 6457008)
 - 3192 Model G (requires cable P/N 6342058)
 - 3194 Models C, D, H (Canada only) > (except the H50) < require cable P/N 1525612
 - 3197 Models C, D (requires cable P/N 6457008)

Local Area Networks

The Proprinter II is compatible with systems configured with the following hardware and software products:

- DOS 3.3
- PC Local Area Network Program Version 1.2
- IBM PC Network Protocol Driver Program
- IBM Local Area Network Support Program
- IBM Token-Ring Network PC Adapter
- IBM Token-Ring Network PC Adapter II
- IBM Token-Ring Network Adapter/A
- IBM PC Network Adapter II
- IBM PC Network Adapter II/A
- IBM Personal System/2 Model 30
- IBM Personal System/2 Model 50
- IBM Personal System/2 Model 60

Physical Specifications:

Width - 419.1mm (16.5 in.)
Depth - 350.5mm (13.8 in.)
Height - 127.0mm (5.25 in.)
Weight - 8.43 kg (18.1 lbs) US & Canada, 8.85 kg (19.5 lbs) all other countries

Operating Environment:

Temperature - 10 - 40.6 degrees C (50 to 105 degrees F)
Relative Humidity - 8 to 80 percent

Publications: The IBM Proprinter II Guide to Operations (SC31-3711) is shipped with the IBM Proprinter II.

The following publications are available:

- IBM Proprinter II/Proprinter XL Guide To Operations (SC31-3711)

- (Except Canada > Power: 100-110V, 50/60 Hz, P/N 87X9717; 115-120V, 50/60 Hz, 87X9712; 200-208V, 50/60Hz, P/N 87X9707; 220-240V, 50/60 Hz, P/N 87X9792. <)
- Cable Lengths (required to cable connect the IBM Proprinter Printer Model 2 to a Personal Computer): Cable length is 1.8 meters (6 feet). Order P/N 1525612 for the IBM 5150 and 5160.
- Color: Single color only (no specify required).
- Guide to Operations Manual.

SPECIAL FEATURES

IBM PC Parallel Attach Cable, P/N 1525612, #5612
IBM PC Serial Attach Cable, P/N 8509386, #6031

SUPPLIES

Ribbons: IBM 4201 Proprinter Ribbon, P/N 6328829

4202 PROPRINTER XL

PURPOSE

The 4202 Proprinter is an XL, a wide carriage serial dot matrix printer for attachment to IBM Personal Computers; Personal Computer Jr. (4860), Personal Computer (5150), Portable Personal Computer (5155), Personal Computer Convertible, Personal Computer/XT (5160), Personal Computer/XT/370 (5160 Mdl 589), Personal Computer/AT (5170), Personal Computer/AT 370 (5170 Mdl 599 and 739), 3270 Personal Computer (5271--DOS 2.1/3.1/3.2, CP 1.2.2/2.1/3.0), 3270 Personal Computer/AT (5273--DOS 3.1/3.2; CP 1.2.2/2.1/3.0), 3270 Personal Computer/G and /GX (5371) 3270 AT/G and /GX (5373) and 3194 (Canada only > (except the mdl H50) <) with P/N 1525612, and compatible non-IBM hosts.

The 4202 adds high speed, wide carriage, desk-top, impact printing to the IBM Personal Computer family. Manual front sheet feed and continuous forms paper handling are integrated into the 4202, which is capable of handling downloadable print fonts (256 character), and is offered with a standard IBM Personal Computer compatible parallel interface, an optional asynchronous serial interface, and an optional 8K print buffer. The 4202 has a 13.6-inch print line, and will accept: continuous forms up to 15 inches in width; cut sheets up to 16.5 inches in width. Other features include - a user-friendly operator panel that lets the user choose many different print modes without the need for programming skills; support for proportional character spacing, software selectable margins and two high printing; approximately four million character ribbon life (DP mode); power-assisted paper loading for continuous forms; 4K standard print buffer; and "quiet" mode, a user-controlled feature that mutes the sound level while printing (10 cpi in DP mode).

The 4202 also includes a host independent self-test that demonstrates many of the print modes; this allows the printer to be demonstrated during self-test.

MODEL

Model 1 001: Includes integrated tractor and friction forms feeding with integrated front sheet feed for cut sheets and envelopes.

Limitations: Continuous Forms: Pinfeed continuous forms can be used: Both edges of the pinfeed forms must be threaded through the tractor. No fasteners are permitted in the areas exposed to the printhead.

Printer Operation and print quality vary with paper and number of copies. Multipart forms should be tested in operating conditions to verify that results are satisfactory. The forms thickness lever must be varied to accommodate differing paper weight and thickness.

Paper Specifications: Maximum continuous forms paper width is 381mm (15 inches). Maximum print-line width is 345.4mm (13.6 inches).

Front Sheetfeed: Front sheetfeed is accomplished by hand insertion. One-part continuous feed paper can remain in the printer while you use cut forms or envelopes of the same or narrower width than the continuous forms.

Paper Width: Cut form: 76.2mm to 419.1mm (3 inches to 16.5 inches). Continuous Forms: 76.2mm to 419.1mm (3 inches to 15.0 inches).

Print standard envelopes:

Type	Size (inches)
No. 6 1/4	3 1/2 x 6
No. 6 3/4	3 5/8 x 6 1/2
No. 9	3 7/8 x 8 7/8
No. 10	4 1/8 x 9 1/2
No. 11	4 1/2 x 10 3/8
No. 12	4 3/4 x 11
No. 14	5 x 11 1/2

Paper Weights:

Single part:

- 12-24 pound, 0.0023-inch to 0.0045-inch thickness *

Multi-part:

- 1 to 3-part forms usage 10 to 15 pound paper * (maximum 0.003-inch thickness)
- 4 part forms use 10 to 12 pound paper * (maximum 0.003-inch thickness)
- For multi-part forms thickness must not exceed 0.014 inch (carbon)
- Carbonless forms...individual plies 0.0019 to 0.003-inch thick. Multiple part carbonless should not exceed 0.012-inch thickness.
- Paper over 24 pound must be tested for acceptable operation and legibility.

*For 3-4 part carbonless forms and for paper weights less than 15 pounds the recommended maximum width is 241.3mm (9.5 inches). Multipart forms with fasteners along edges are not supported.

Non-IBM Hosts: The 4202 attaches to the following non-IBM PCs via the parallel or the serial interface and the appropriate attachment cable (Customer purchase and install). These non-IBM personal computers have been tested with the 4202 by IBM with the following results. This does not imply lack of compatibility with other non-IBM personal computers that may not have been tested.

PC	Degree of Compatibility	Modifications
Compaq Deskpro	Functionally compatible*	Parallel attachment without modification
Compaq Portable	Functionally compatible*	Parallel attachment without modification
AT&T (Mdl 6300)	Functionally compatible*	Serial attachment without modification Parallel attachment without modification
Apple IIE	Full text**	Serial attachment
Apple IIC	No graphic	Apple cable DP print mode only

*These non-IBM computers were tested with the 4202 using IBM's version of the parallel interface or asynchronous serial interface. The 4202 was tested using the appropriate attachment cables. This test was done using selected popular application software packages typically available for the specific non-IBM computers being tested. There were no problems noted that were attributed to interface differences. The printer output prepared with the 4202 attached to these non-IBM computers operating with IBM PC DOS and using selected application programs was comparable to the printer output of runs with the IBM Personal Computer.

**These non-IBM computers were tested with the 4202 using IBM's version of the asynchronous serial interface and the appropriate non-IBM cable. Text printing resulting from attachment of the 4202 to these non-IBM computers, using typical Apple software applications was comparable to text printing resulting from the attachment of the 4202 to IBM Personal Computers using typical IBM-compatible application programs.

To insure satisfactory results the user must test the specific printer, computer and software combination against the desired results. The selection and testing of an IBM printer and any combination of non-IBM computers are the responsibilities of the IBM Authorized dealer and the user.

IBM makes no warranties, expressed or implied, including but not limited to, the warranty of merchantability and the implied warranty of fitness for a particular purpose with respect to the compatibility of IBM printers and non-IBM computers using any particular software applications.

Copyrights: Compaq Deskpro and COMPAQ Portable are registered trademarks of COMPAQ Computer Corporation. AT&T is a registered trademark of American Telephone and Telegraph Co. Apple IIE and Apple IIC are registered trademarks of Apple Computer, Inc.

Customer Setup (CSU): The 4202 is designated a customer setup machine. The marketing representative must advise the customer of his/her responsibilities before receipt of the machine. Customer setup instructions are included in the "IBM Proprinter XL Guide to Operations".

HIGHLIGHTS

- Wide carriage printing (13.6-inch maximum print line)
- User friendly operator panel allowing selection of
 - Near Letter Quality printing
 - 12 CPI printing
 - Condensed printing
 - Emphasized printing
 - Double high printing
 - Double wide printing
 - Proportional character spacing
 - Quiet Mode
 - Audible alarm on/off
- Multiple speed serial impact printing
 - 200 cps DP Printing
 - 100 cps Emphasized Printing
 - 40 cps Near Letter Quality Printing
- Integrated front sheet feed for envelopes, cut sheet, etc.
- 256 character downloadable font capability
- Proportional character spacing
- Power-assisted paper loading
- Quiet mode
- Document on demand - tractors below print line
- Up to 4-part forms (original plus 3 parts)
- "Clean Hands" ribbon cartridge with approximately 4 million character life
- Integrated tractor and friction feed
- APA (All Points Addressable) graphics
- Program selectable line spacing 1/6, 1/8, 7/72, N/72, N/216*

*Printer recognizes n/216 inch spacing commands; the smallest individual line increment is 1/144 with corrections made every third print line to obtain apparent n/216 spacing.

- 76.2mm (3 inches) to 419.1mm (16.5 inches) wide paper can be used with the front sheet feed
- 88.9mm (3 inches) to 381.0mm (15 inches) wide paper can be used with the continuous forms feed
- Bottom of forms printing - within 12.7mm (0.5 inches) of the bottom of a cut form
- IBM PC compatible parallel interface (standard)
- Optional asynchronous serial interface module - customer purchase and set-up
- Optional 8K print buffer - customer purchase and set-up

Note: The Proprinter 5K print buffer functions as an 8K print buffer in the 4202.

Physical Specifications:

Width - 574.0mm (22.6 inches)
Depth - 363.2mm (14.3 inches)
Height - 133.4mm (5.25 inches)
Weight - 9kg (23.6 pounds)

SPECIFY

No specify.

- (Canada only) > Voltage (120V AC, 1-phase, 60 Hz). No specify required. Standard power cord is 1.8m (6 ft.). <
- Power (100/120/200/220/230/240V AC, 1 phase, 50/60 HZ. No specify required.
- A 2.8m (9.2 ft) power cord is supplied with the machine. The country will select a power cord plug to the specifications

most commonly used in that country. See configurations for order information.

- Color: Pearl white only (no specify required).

SPECIAL FEATURES

Asynchronous serial interface P/N 6493187, AAS #3000.

8K print buffer P/N 6493188, AAS #4000.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Attachment cable (required to cable connect the 4202 to the host). Specify P/N 1525612 (#5612) for parallel attachment (1.8m/6 ft); P/N 8509386 (#6031) for serial attachment (6m/19.5 ft).

SUPPLIES

Ribbons: The 4202 black fabric ribbon (P/N 1040150) or equivalent. None required with machine order.

4207 PROPRINTER X24

PURPOSE

The 4207 Proprinter X24 is a narrow-carriage high-speed, 24-wire serial dot-matrix impact letter quality printer for attachment to IBM Personal Computers, certain IBM Display Stations, and compatible non-IBM PC hosts. The 4207 Proprinter X24 will provide letter quality printing and high-resolution graphics in addition to all the print functions of the IBM Proprinter XL.

MODELS

Model 001

Limitations:

- Continuous Forms: Both edges of the pinfeed forms must have pinfeed holes.
- Paper Specifications:
 - Maximum paper width is 11 inches
 - Maximum pin to pin width for continuous forms is 10 inches
 - Maximum print-line width is 8.0 inches.
- Single Sheet feed: Single sheet is by manual front insertion, unless the sheetfeed is used.
- Sheetfeed Option:

Sheetfeed Option-Only Paper Characteristics:

- Paper Length: 5.5 in. (139.7 mm) to 14 in (356 mm)
- Paper Weight: 16 lb. (60 g/sq m) to 24 lb. (90 g/sq m)
- Paper Width: 5.5 in. (139.7 mm) to 8.5 in. (216 mm)

Sheetfeed Option Physical Description:

- Height - 205mm (8 in.)
- Width - 323mm (12.7 in.)
- Depth - 230mm (9.1 in.)
- Weight - 5 lb.

Supply and Exit Bin Capacity: 100 sheets of 20 lb. (75 g/sq m) paper. (15-mm stack)

Typical Form Sizes: US/Canada (Type: 8.5" x 11" (P4) - 8.5" x 14" (legal); World Trade (Type: 8.24" x 11.69" (A4))

Prerequisites: For parallel attachment, the IBM PC Printer Attach Cable (P/N 1525612, #5612) is required and must be ordered separately.

Customer Setup (CSU): The 4207 Proprinter X24 is a customer setup (CSU) machine. The CSU allowance is one day. Detailed set-up instructions are included with each machine. Set-up service is available from the IBM National Service Division at IBM hourly rates and minimums.

HIGHLIGHTS

- High Quality Printing
 - Letter quality text
 - High resolution, all points addressable (APA) graphics
 - Four resident type families: (sans serif, Courier 10, Prestige Elite-12, and Courier Proportional)
 - FontSet Option
- High Speed Printing
 - 67-80 cps burst speed in quality mode
 - 200-240 cps burst speed in draft mode
- Easy To Control Printing

- Operator panel selection of print modes
- User controlled quiet mode for DP printing
- Set up mode for selection of commonly used functions
- Pitch indicators
- Quiet mode indicator

● Versatile Printing

- Variable pitches (5, 6, 8.55, 10, 12, 17.1 CPI and proportional)
- 6K standard print buffer
- 8.0 in. printing line
- Double high printing
- FontSet Option for additional type families

● Versatile Paper Handling

- Continuous forms
 - ▲ Built-in variable width tractors
 - ▲ Document on demand (tear off page just printed)
 - ▲ Continuous forms up to 10 inches wide
 - ▲ Power assisted continuous forms loading
- Single sheets and forms
 - ▲ Convenient front cut sheet feed
 - ▲ Cut forms up to 11 inches wide
 - ▲ Standard friction feed
 - ▲ Sheetfeed Option

DESCRIPTION

The printer is a new member of the Proprinter family and attaches to the IBM Personal Computers, to many compatible non-IBM personal computers, and to several IBM display stations. The printer offers two software or operator-selectable burst print speeds of 67-80 cps (Letter Quality) and 200-240 cps (Draft mode). Speed is dependent on the selected print mode and pitch. Both Draft and Letter Quality may be enhanced by double strike printing. Graphics and text modes may be alternately used in the same document.

The 4207 Proprinter X24 ribbon is a black fabric ribbon in a "clean hands" cartridge for easy installation. The ribbon is not the same as the ribbon used on the 9-wire Proprinters (4201 and 4202). A modified cartridge design prevents the installation of the 9-wire Proprinters' ribbons on the 4207 Proprinter X24.

Other enhancements include:

- This printer has four type families resident in the printer. Each type family is a group of typefaces that share a basic design, but vary in boldness and size. Over 50 typefaces are available.
- FontSet Option: will allow user-selected optional fonts to be placed in non-volatile memory.

The 4207 Proprinter X24 allows the user to choose among manually-fed cut sheets, continuous forms, or using the sheetfeed, automatically-fed cut sheets.

This printer attaches to the following:

- Personal Computer (5150)
- Portable Personal Computer (5155)
- Personal Computer XT (5160)
- Personal Computer XT Model 286 (5162)
- Personal Computer XT/370 (5160 Model 589)
- RT PC (6150 and 6151) (IBM 4201 Proprinter-only functions supported)
- Personal Computer AT (5170)
- Personal Computer AT/370 (5170 Models 599, 739, 919, 939)
- 3270 Personal Computer (5271) (IBM 3270 Workstation Program Version 1.0)
- 3270 Personal Computer AT (5273) (IBM 3270 Workstation Program Version 1.0)
- 3270-PC/G and GX (5371)

- 3270-PC AT/G and AT/GX (5373)
- PC Convertible
- System/2 Model 30 (8530)
- System/2 Model 50 (8550)
- System/2 Model 60 (8560)
- System/2 Model 80 (8580)

Local Area Network Support: The 4207 Proprinter X24 is compatible with the following hardware and software products:

- DOS 3.3
- PC Local Area Network Program Version 1.2
- IBM PC Network Protocol Driver Program
- IBM Local Area Network Support Program
- IBM Token-Ring Network PC Adapter
- IBM Token-Ring Network PC Adapter II
- IBM Token-Ring Network Adapter/A
- IBM PC Network Adapter II
- IBM PC Network Adapter II/A
- IBM System/2 Model 30 (8530)
- IBM System/2 Model 50 (8550)
- IBM System/2 Model 60 (8560)

3708 Network Conversion Unit (local attachment via the optional serial interface module).

The 4207 Proprinter X24 can be attached to an IBM 3708 Network Conversion Unit. The optional serial interface module must also be ordered for the 4207 Proprinter X24. The IBM 3708 Network Conversion Unit provides IBM 3270 protocol conversion and protocol enveloping for attaching the 4207 Proprinter X24, other Proprinters, and ASCII displays. Using the 4207 Proprinter X24 in this configuration provides a very effective low-cost solution to access IBM 3270 host applications. The 4207 Proprinter X24s attached to the IBM 3708 Network Conversion Unit are supported as an IBM 3287 Model 1 or 2. Printers are supported as an LU1 (SCS model) and/or LU3 (DSC model).

The PC/Host File Transfer and Terminal Emulator Program (6476052) 5875-MMA, 3708 feature code 0914 can be used with an IBM Personal Computer with the 4207 Proprinter X24 and attached to an IBM 3708 Network Conversion Unit. (Refer to Programming Announcement dated September 18, 1986).

Token Ring LAN support: The 4207 Proprinter X24 offers one-button selection of quality, pitch, font, and quiet mode. In addition the operator may use the printer Setup mode to select emphasized, double-high, double-wide, slashed zeroes, and reset the printer. The operator may also use the operator panel to print the status of the setup mode controllable options.

Printer Options and Features: The Printer attaches to the IBM Personal computer via an IBM PC Printer attach cable. Attachment to other than the IBM Personal Computer may require a different cable.

An optional sheetfeed is offered for the printer. This option permits convenient, automatic loading of cut sheets or letterhead with no additional software.

An optional FontSet is available. This option contains customer setup hardware, diskettes, and a Guide to Operations for downloading up to 11 additional type families. Each downloaded type family can be modified at the operator panel to print in several type faces. Also, this option allows the Printer to retain the downloaded font and operator panel settings in memory even when the printer has been turned off. This option will be offered in two versions:

1. P/N 94X6120: FontSet option (Diskettes, module, manual, module tool)
2. P/N 94X6121: FontSet diskettes, manual

An optional Asynchronous serial interface (identical to Proprinter and Proprinter XL) is also available.

FontSet Option: Each diskette (or diskettes) will contain the download utility and up to 11 font data files. All diskettes will be double-sided, available in 5.25-inch and 3.5-inch diskettes and will support DOS levels 2.0 and higher.

The FontSet option offers the following fonts:

The FontSet option will allow the user to place selected optional typefaces in non-volatile memory. This option will contain customer setup hardware, diskettes and a Guide to Operations for downloading up to 11 additional type styles. Each downloaded type family can be modified at the operator panel to print in several pitches. Also, this option allows the printer to retain the downloaded font and operator panel setting in memory. This option will be offered as follows:

- P/N 94x6120
English version (Contains 32K RAM, Unplug tool, Guide to Operations, and two diskettes to provide 11 additional fonts)
- P/N 04F5185
International version (contains 12K RAM, Unplug tool, Guide to Operations, NLS (code page 850) for Resident Fonts (two diskettes), and the International Font Option (code page 437 for 11 additional fonts- two diskettes; and code page 850 NLS for 11 additional fonts-two diskettes)
- Resident Fonts:

4208 PROPRINTER XL24

PURPOSE

The 4208 Proprinter XL24 is a wide-carriage high-speed, 24-wire serial dot-matrix impact letter quality printer for attachment to IBM Personal Computers, certain IBM Display Stations, and compatible non-IBM PC hosts. The 4208 Proprinter XL24 will provide letter quality printing and high-resolution graphics in addition to all the print functions of the IBM Proprinter XL.

MODELS

Model 001

Limitations:

- Continuous Forms: Both edges of the pinfeed forms must have pinfeed holes.
- Paper Specifications:
 - Maximum paper width is 419.1mm (16.5 in.)
 - Maximum pin-to-pin width for continuous forms is 381mm (15.0 in.)
 - Maximum print-line width is 335mm (13.6 in.)
- Single Sheet feed: Single sheet is by manual front insertion, unless the sheetfeed is used.
- Sheetfeed Option:

Sheetfeed Option-Only Paper Characteristics:

- Paper Length: 139.7mm (5.5 in.) to 356mm (14 in.)
- Paper Weight: 60g/sq.m (16 lb.) to 90g/sq.m (24 lb.)
- Paper Width: 139.7mm (5.5 in.) to 356mm (14.33 in.)

Sheetfeed Option Physical Description:

- Height: 205mm (8 in.)
- Width: 477mm (18.8 in.)
- Depth: 230mm (9.1 in.)
- Weight: 5 lb.

Supply and Exit Bin Capacity: 100 sheets of 75 g/sq.m (20 lb.) paper (15mm stack)

Typical Form Sizes: US/Canada (Type: 8.5" x 11" (P4) - 8.5" x 14" (legal); World Trade (Type: 8.24" x 11.69" (A4))

Prerequisites: For parallel attachment, the IBM PC Printer Attach Cable (P/N 1525612, #5612) is required and must be ordered separately.

Customer Setup (CSU): The 4208 Proprinter XL24 is a customer setup (CSU) machine. Detailed setup instructions are included with each machine.

3708 Network Conversion Unit (local attachment via the optional serial interface module).

The 4208 Proprinter XL24 can be attached to an IBM 3708 Network Conversion Unit. The optional serial interface module must also be ordered for the 4208 Proprinter XL24. The 3708 Network Conversion Unit provides 3270 protocol conversion and protocol enveloping for attaching the 4208 Proprinter XL24, other Proprinters, and ASCII displays. Using the 4208 Proprinter XL24 in this configuration provides a very effective low-cost solution to access 3270 host applications. The 4208 Proprinter XL24's attached to the 3708 Network Conversion Unit are supported as an 3287 Model 1 or 2. Printers are supported as an LU1 (SCS model) and/or LU3 (DSC model).

The PC/Host File Transfer and Terminal Emulator Program (P/N 6476052) 5875-MMA, 3708 feature code #0914 can be used with an IBM Personal Computer with the 4208 Proprinter XL24 and attached to an 3708 Network Conversion Unit. (Refer to Programming Announcement September 18, 1986).

Token-Ring LAN support: The 4208 Proprinter XL24 offers one-button selection of quality, pitch, font, and quiet mode. In addition the operator may use the printer Setup mode to select emphasized, double-high, double-wide, slashed zeroes, and reset the printer. The operator may also use the operator panel to print the status of the setup mode controllable options.

Printer Options and Features: The Printer attaches to the IBM Personal computer via an IBM PC Printer attach cable. Attachment to other than the IBM Personal Computer may require a different cable.

An optional sheetfeed is offered for the printer. This option permits convenient, automatic loading of cut sheets or letterhead with no additional software.

An optional FontSet is available.

This option will contain customer setup hardware, diskettes, and a "Guide to Operations" for downloading up to 11 additional type families. Each downloaded type family can be modified at the operator panel to print in several type faces. Also, this option allows the Printer to retain the downloaded font and operator panel settings in memory even when the printer has been turned off. This option will be offered in two versions:

1. P/N 94X6120: FontSet Option (Diskettes, module, manual, module tool)
2. P/N 94X6121: FontSet diskettes, manual

An optional Asynchronous serial interface (identical to Proprinter and Proprinter XL) is also available.

FontSet Option: Each diskette (or diskettes) will contain the download utility and up to 11 font data files. All diskettes will be

double-sided, available in 5.25-inch and 3.5-inch diskettes and will support DOS levels 2.0 and higher.

The FontSet Option will allow the user to place selected optional typefaces in non-volatile memory. This option will contain customer setup hardware, diskettes, and a Guide to Operations for downloading up to 11 additional type styles. Each download type family can be modified at the operator panel to print in several pitches. Also, this option allows the printer to retain the downloaded font and operator panel setting in memory. The following option versions will be offered.

The English version (P/N 94X6120) contains 32K RAM, Unplug tool, the Guide to Operations, and 2 diskettes to provide 11 additional fonts.

The International version (P/N 04F5185) contains 32K RAM, Unplug tool, Guide to Operations, NLS (code page 850) for Resident Fonts (2 diskettes), and the International Font Option (code page 437) for 11 additional fonts (2 diskettes) and code page 850 NLS for 11 additional fonts (2 diskettes).

The FontSet option offers the following fonts:

Character Set:

- IBM PC International Character Set--NLS:
 - Code Page: 850
 - 3.5-inch Diskette P/N 94X6208
 - 5.25-inch Diskette P/N 94X6201
 - Total Fonts: 5 (Draft, Courier 10, Courier 12, Prestige Elite 12, Courier PS)
- IBM PC Multilingual Character Set--FontSet Option
 - Code Page: 437
 - 3.5-inch Diskette P/N 94X6169
 - 5.25-inch Diskette P/N 94X6168
 - Total Fonts: 11 (Artisan 10, Boldface PS, Boldface Italic PS, Courier 10 Italic, Courier 12, Courier 12 Italic, Courier PS Italic, Letter Gothic 12, Gothic 17, Prestige Pica 10, Title PS)

4210 PRINTER

PURPOSE

The 4210 Printer is a 200 cps serial dot matrix impact printer for local and remote attachment to System/36 and System/38. Three print quality modes are standard including NLQ (near letter quality) at 40 cps. The 4210 is designed for light-duty non-graphic printing applications.

MODELS

Model 1 001

Limitations:

1. Use of pre-printed forms is not recommended, unless thoroughly tested, because of possible print registration errors.
2. The LAC (Load Alternate Characters), SCS Transparency, and the ASCII Transparency commands are not supported.
3. Unattended operation is not recommended.
4. Under certain conditions (e.g. a power loss to the printer during printing, or a printer "machine check"), there is a potential for the data loss not being communicated to the host.
5. A Cancel command from the host cannot clear the print buffer and may result in the printing of unwanted data.

Prerequisites

Attachment	Requirement
System/36 (5360, 5362, 5364)	An available Workstation Controller position. The System/36 SSP must be at Release 4 or higher.
System/38 (5381, 5382)	An available Workstation Controller position. The System/38 CPF must be at Release 7 or higher.
5294 Remote Control Unit	An available workstation position. (Remote attachment to System/36 with SSP at Release 4 or higher and System/38 with CPF at Release 7 or higher.)

Note: The 4210 must be defined as a 4214 Model 2 Printer.

Customer Setup (CSU): The 4210 is designated as a customer setup machine. Setup instructions are included with each machine.

HIGHLIGHTS

- Rated print speeds of 200 cps for DP quality, 100 cps for Emphasized and 40 cps for NLQ (near letter quality).
- Vertical spacing: System/36 - 3, 4, 6, and 8 lines per inch; System/38 - 4, 6, 8, and 9 lines per inch.
- Horizontal spacing of 5, 10, 12, and 17.1 characters per inch.

- Multipart forms up to 4 parts (including original).
- Power-assisted paper loading for continuous forms.
- Program compatible with 4214 Printer function subset. (See Compatibility section.)
- Twinax attachment to System/36, System/38 and 5294 Remote Control Unit with cable-thru and termination standard.
- Ribbon cartridge allows "clean hands" removal and installation.

Physical Specifications:

Width - 574.0mm (22.6 in.)
Depth - 363.2mm (14.3 in.)
Height - 133.4mm (5.25 in.)
Weight - 11.3 kg (25 lbs.)

Operating Environment:

Temperature - 10 to 41 degrees C (50 to 105 degrees F)
Relative Humidity - 8 to 80 (percent)

Publications:

- SC31-3782 Description, Programming, and Operations Kit (Includes SC31-3783 and SC31-3784)
- SC31-3783 Guide to Operations
- SC31-3784 Product and Programming Description
- SC31-3785 Hardware Maintenance and Service Manual

DESCRIPTION

The 4210 is a compact table top convenience printer utilizing serial dot matrix impact technology.

The print head consists of nine (9) wires arranged in a single vertical column. Each wire has a diameter of 0.28mm (0.011 in.).

Print Quality Modes

DP Mode: The character box is 9 dots high by 12 dots wide. The nominal DP character matrix is 7 dots high (0.098 in.) by 4 of 7 wide. Maximum character box height is 0.125 inches.

Emphasized Mode: The dot density is doubled horizontally compared to DP mode. The character box is 9 dots high by 24 dots wide. The nominal Emphasized character matrix is 7 dots high (0.098 in.) by 7 of 13 wide. Maximum character box height is 0.125 inches. Emphasized Mode is selectable from the Operator Panel only.

NLQ Mode (Near Letter Quality): The dot density is doubled both horizontally and vertically compared to DP mode. The character box is 18 dots high by 24 dots wide. The nominal NLQ character matrix is 13 dots high (0.098 in.) by 7 of 13 wide. Maximum character box height is 0.125 inches.

The 4210 will provide the following forms handling capabilities:

- Program controlled line spacing capability of 1/6 and 1/8 inches and incremental line spacing of n/72 inch increments.
- Horizontal positioning of characters is operator adjustable over a range of at least one full character width to allow for horizontal print alignment. With a print line length of 335.28mm (13.2 in.), the following number of characters per line is possible:

66 Characters at 5 cpi
132 Characters at 10 cpi
158 Characters at 12 cpi
198 Characters at 15 cpi*
220 Characters at 16.7 cpi*

* Printing in these densities will be at 17.1 cpi. However, the number of characters printed on the line (MPP) will be adjusted for the cpi selected, as shown above.

- Printing capability within 12.7mm (0.5 in.) of the top and bottom of the form.
- Forms length for both continuous (length between folds) and cut forms is 76.2mm (3 in.) minimum to the maximum length specifiable by the printer data stream.
- Forms thickness is manually adjustable to allow continuous multipart and cut forms up to 4 plies (original + 3 copies) to be used. Use of pre-printed forms is not recommended.
- An easy to read guide to accurately position forms and first print position on forms both horizontally and vertically.
- Forms movement under control of host software support (e.g., description of page length and first print position).

Continuous Forms

- Continuous forms width from 76.2mm (3 in.) to 381.0mm (15 in.) with a maximum print line length of 335.28mm (13.2 in.).
- Manually adjustable width forms tractors that span the printer width range of 76.2mm (3 inches) to 381.0mm (15 inches) are standard.
- Document on Demand capability, the convenience of removing a printed continuous form without wasting or disturbing the unprinted forms.
- Print within 12.7mm (0.5 inches) from the top and bottom edges of the form when printing Document on Demand applications.

Cut Forms/Cut Sheets

- Paper width from 76.2mm (3 inches) to 420.0mm (16.5 inches) with a maximum print line length of 335.28mm (13.2 inches).
- The ability to easily load cut sheets or cut form sets (single or multi-part forms) from the front of the printer.
- The ability to have single part continuous forms remain in the printer while cut sheets, cut forms, or envelopes are manually inserted for printing. The dimensions of the inserted material must be of the same width or narrower than the continuous form. The continuous forms still move through the printer.
- The ability to manually position the forms at a predetermined first line position which can be at the top of the form.

End-of-Forms Sensor

- The printer will detect end-of-forms when approximately 0.9 inches of paper remains and will continue to print to within 0.5 inches of the bottom of the page.

Compatibility: The 4210 is designed to attach to the System/36 or System/38 and maintain compatibility with the 4214 Printer in functionally similar areas where not precluded by mechanical differences. Major differences between the 4210 and 4214 are:

- The 4210 will not provide support for the Load Alternate Characters (LAC) command. As a result, the following programs are not supported:
 - S/36: Advanced Printer Function Program (5727-AP1/AP6); Business Graphics Utilities (5727-BG1/BG6)
 - S/38: Advanced Printer Function Utility (5714-UT2); Business Graphics Utility (5714-GP1) and GDDM
- The 4214 uses either 120 or 108 steps per inch, depending on paper feed mechanism, and uses a software algorithm to em-

ulate movement in 72nds of an inch. The 4210 provides movement in 72nds of an inch.

- The 4214 supports 5, 10, 12, 15 and 16.7 cpi. The 4210 supports character spacing of 5 cpi (double wide mode), 10, 12 and 17.1 cpi. If 15 or 16.7 cpi is selected on the 4210, character spacing will be at 17.1 cpi, however the number of characters printed will be related to the cpi selected.
- The 4214 supports NLQ in 10 or 12 cpi; the 4210 will print NLQ at 5 (Double wide), 10 and 12 cpi.
- The 4214 offers an Auto Sheet Feed (ASF) mechanism and supports the drawer selection parameters of the Page Presentation Media control. The 4210 does not support an ASF device and will ignore the drawer selection command.
- The selection of Near Letter Quality from the 4210 Operator Panel will override the last received data stream quality selection. A subsequent data stream quality selection will override the last Operator Panel quality selection.

Cable Orders: The 4210 is connected to the System/36, System/38, or 5294 via twinaxial cable or shielded twisted pair cable. For information on twinaxial cabling see the "IBM 5250 Information Display System Planning and Site Preparation Guide", GA21-9337. For information on twisted pair cabling see "IBM Cabling System - Planning and Installation Guide", GA27-3361.

The customer is responsible for ordering, installation and maintenance of these cables and their various parts. The attachment cables may be purchased from IBM or from a customer-selected source. When twinax cabling is ordered from IBM:

Twinax Cables For:	Assembled P/N	Bulk (No. Connectors) P/N
Indoor/outdoor	7362267	7362211 (note 1)
Plenum	7362062	7362061 (note 2,4)
Connectors	P/N	
Kit of two indoor /outdoor cable connectors	7362268	(note 1)
Kit of two plenum cable connectors	7362063	(note 2)
Cable to Cable Adapter	7362230	(note 3,4)
Insulation Tubing	483619	(note 4)
Twinaxial Station Protector	7361807	(note 5)

Notes:

1. The order must specify the desired length. One twinaxial connector kit, P/N 7362268, required for each cable. This is an indoor/outdoor cable. Two male connectors included.
2. The order must specify the desired length. One twinaxial connector kit, P/N 7362063, required for each cable. Two male connectors included.
3. Use to join two P/N 7362267 or P/N 7362262 cable assemblies together.
4. Must be used when connecting two Teflon covered cable assemblies P/N 7362062 together with adapter P/N 7362230.
5. The kit includes two protectors. One is required at the end of each twinaxial attachment cable installed outdoors (either above or below ground level). Individual twinaxial station protectors, P/N 7362426, are available for replacement purposes. The station protector is CSU.

SPECIFY

- (Canada only > Voltage (120V AC, 1-phase, 60 Hz); No specify required. Standard power cord is 1.8m (6 ft.). <)
- Power: 100/120/200/220/230/240V AC, 1-phase, 50/60 Hz. No Specify required.
- A 2.8m (9.2 ft) power cord is supplied with the machine. The Country will select a power cord plug to the specifications most commonly used in that country. (See configurations for order information.)

National Languages: The following languages are available and are selected by switch setting at time of installation:

Belgian/Dutch	German
Belgian/French	Greek
Brazilian	Dutch
US English	Arabic
Danish	Norwegian
UK English	Icelandic
Finnish	Hebrew
French	Turkish
Italian	Thai
Japanese (English)	Swedish
Japanese (Katakana)	Yugoslavian
Portugese	
Spanish	
Canadian/French	

In addition, the following language groups are selectable:

Multilingual Cyrillic
Latin 2

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES

The following supply item is available

- IBM 4202/4210 Ribbon Cartridge (One included with printer), P/N 1040150

Approximate life of 4 million characters (DP Mode).

The above ribbon yields are derived from IBM-conducted tests in DP Mode. Ribbon life experienced by the user may vary significantly depending on the user's own quality criteria and on factors such as printer condition, machine settings, and paper quality.

Ordering Information: The Description, Programming and Operations Kit (the Product and Programming Description manual is

provided in English only) and the Operator Panel overlay are shipped in the language required for a particular country as determined by the Country Code. Exceptions, such as countries with 2 or more languages will require Specify features or special model numbers as explained below.

Language	Countries
Canadian/ French	Canada
English	Canada, Australia, New Zealand, Bahamas, Barbados, Jamaica, Philippines, Thailand, Netherlands Antilles, Taiwan, Malaysia, Singapore, Indonesia, Bermuda
Katakana	Japan
Spanish	Mexico, Guatemala, Honduras, Bolivia, Dominican Republic, El Salvador, Nicaragua, Ecuador, Argentina, Columbia, Paraguay, Venezuela, Uruguay, Panama, Costa Rica, Peru, Chile

Orders from Canada require a Specify feature for language as follows:

#2934 Canadian English
#2935 Canadian French

Translated Publications

Language	Title	P/N
Canadian French	Description, Programming and Operations Kit	88X5469
English	Description, Programming and Operations Kit Hardware Service and Maintenance	88X5526 88X5527
Japanese/ Katakana	Description, Programming and Operations Kit	88X5477
Spanish	Description, Programming and Operations Kit	88X5539

4216 PERSONAL PAGEPRINTER**PURPOSE**

The 4216 Personal Pageprinter is a compact, table top, page printer capable of printing up to 6 pages per minute utilizing a laser/electrophotographic (EP) process. The 4216 is designed for use with the new IBM Personal Publishing System Solution Packages and attaches to the host systems through the IBM Personal Pageprinter Adapter and IBM Personal Pageprinter attachment cable. The new video interface is designed to allow the printer to be coupled with the host system, with a large portion of what is normally regarded as printer function residing in the IBM Personal Pageprinter Adapter. The IBM Personal Publishing System Application System Solution Packages provide the facilities to do compound document creation, editing and printing for the cross industry application known as "Desktop Publishing".

MODELS**Model 020: Video Interface**

Limitations: The 4216 is capable of printing up to 6 pages per minute. However, the printer's performance depends on several things:

- 6 pages per minute excludes the first page print time of 25 sec.
- Host system and application (image/graphics content varies performance)
- Paper size (6 PPM is for letter or A4 size paper)
- The complexity of the page to be printed

The 4216 is capable of handling the following paper types and sizes:

1. Letter Size - 216 x 279mm (8.5 x 11 in.)
2. Legal Size - 216 x 356mm (8.5 x 14 in.)
3. Half Letter - 140 x 216mm (5.5 x 8.5 in.)
4. A4 - 210 x 297 mm
5. B5 - 182 x 257 mm
6. A5 - 148 x 210 mm
7. Envelopes - Manual
8. Transparencies - A4 or Letter (Manual) (similar to IBM Copy Transparency 1674107)
9. Xerographic Labels - Letter or A4 size (Manual only)

Envelopes, Labels and Transparencies should be tested by the customer for satisfactory results before purchasing large quantities.

For satisfactory feeding, envelopes should not be stored nor manually fed where the humidity exceeds 70% R.H.

Transparencies with white optical sensor stripes coated with silicon lubricant and transparencies intended for infrared copiers are not recommended.

Transparencies should be treated for de-static control.

Maximum envelope stacking: 25 in upper tray; 5 in lower tray

All papers placed in the printer should be new, unused and without packaging damage. To improve feed reliability all papers should be "fanned" before being placed into the input tray.

For best performance, xerographic paper should be used in the printer. Because of its special characteristics, xerographic paper usually works better than other types of paper. IBM Multi-System Paper is top quality xerographic paper.

Plain bond paper of one of the following compositions may also be used:

- No. 1 sulfite (100% chemical wood pulp)
- 25% cotton content
- 50% cotton content
- Paper made from recycled office paper

100% cotton content paper is not recommended for use in this printer because poor print quality may result and extended use may shorten the life of the cleaning unit or fuser assembly.

The 4216 is capable of automatically feeding, printing, and ejecting paper with weights of 60 - 90 g/m² (16 to 24 lbs). Printing on pre-printed forms should be tested by the customer for satisfactory results.

The printer feeds and aligns envelopes whose length, defined as the dimension parallel to the feed direction, ranges from a minimum of 187mm (7.36 in.) to a maximum of 250mm (9.84 in.), and whose width, defined as the dimension perpendicular to the feed direction, ranges from a minimum of 98.4mm (3.875 in.) to a maximum of 176mm (6.93 in.).

The composition and substance weight of envelopes which are fed are based on the same standards as for paper.

Refer to the "IBM Page Printers Paper Reference Booklet" (P/N 1686710, G544-3178) for additional paper characteristics.

Prerequisites: A IBM Personal Pageprinter attachment cable (P/N 01F1175) is required to attach the 4216 to the IBM Personal Publishing System. Refer to the "IBM Personal Publishing System" for additional information.

Customer Setup (CSU): The 4216 is designated as a customer setup (CSU) box. A customer "Guide-To-Operations Manual" is provided with this printer. CSU allowance is one day. IBM setup is available at the applicable IBM hourly service rate and terms.

HIGHLIGHTS

- Up to 6 pages per minute for letter size paper
- 300 x 300 DPI Resolution
- Video Interface standard
- Uses memory resident in the host
- Very Quiet (52 dBAI-printing; 48 dBAI-idling)
- 150 sheet single input drawer standard
- Two output trays for sequenced or unsequenced output
- Average expected usage is 1,000 pages per month
- The duty cycle* specification is 3,000 pages per month
- Handles various paper sizes and weights
- Envelopes, Transparencies and Labels
- Initial set of Supplies included (Toner Cartridge, Photoconductor Kit)
- Memory, Printer Control Function, and Fonts are all resident in the host.

* Duty cycle is defined as the maximum pages per month the printer can be run and still expect to meet product specifications. Refer to the "IBM Personal Publishing System" for additional information.

DESCRIPTION

The 4216 Personal Pageprinter is a compact, table top, page printer capable of printing up to 6 pages per minute utilizing a laser/electrophotographic (EP) process. It is capable of printing on various paper types and sizes with a high resolution dot matrix pattern. The 4216 provides an output device for the IBM Personal Publishing Systems. The 4216 is designed for attachment to the IBM Personal Publishing System host systems through the IBM Personal Pageprinter Adapter and IBM Personal Pageprinter attachment cable. The special serial video interface allows the printer to be coupled with the host system, with a large portion of what is normally

regarded as printer function residing in the IBM Personal Pageprinter Adapter.

The 4216 is designed for customer setup (CSU) and ease of use. The printer can communicate with the operator via the control panel LED display and indicators. The operator can control the printer via control panel push buttons. The control panel is used by the customer to verify printer operation and diagnose problems.

The operator can gain access to the mechanism for supplies changes via an access cover. The customer will be supplied information necessary to install, relocate, operate and determine when service is required.

Physical Specifications:

Width: 418mm (16.46 in.)
Depth: 449mm (17.68 in.)
Height: 212.5mm (8.37 in.)

Weight: The maximum weight of the printer ready for operation including all trays, consumables, but not including packing material, paper, documentation or font cartridge shall be 16kg (35 lbs.). The maximum weight of the printer packaged for shipping to the customer shall be 22.7kg (50 lbs.).

Operating Environment:

Temperature: 15.6 - 32.2 degrees C (60 to 90 degrees F)
Relative Humidity: 20 to 80%
Wet Bulb: 22.8 degrees C (73 degrees F)

Publications: The following publication is shipped with 4216 Personal Pageprinter.

- (P/N 00F5794) IBM Personal Pageprinter (4216-020) Guide To Operations Manual

The following publications will be available by 3Q87 from Mechanicsburg for a fee. To order, contact your IBM representative.

- (P/N 00F5794) IBM Personal Pageprinter (4216-020) Guide To Operations Kit
- (P/N 00F5793) IBM Personal Pageprinter (4216-020) Hardware Maintenance and Service Manual Kit
- IBM Personal Pageprinter (4216-020) HMS Vol. 1
- IBM Personal Pageprinter (4216-020) HMS Vol. 2
- IBM Personal Pageprinter (4216-020) Planning and Description Manual (Included with GTO)
- IBM Personal Pageprinter (4216-020) GTO

SPECIFY

- Voltage: 120V, 50/60 Hz, Single Phase. (IBM Personal Pageprinter (4216-020) Low Voltage (P/N 90X6300)). A 1.8m (5.9 ft) power cord with non-locking plug is included.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES

- Toner Cartridge (6 per carton) (P/N 6190603)
- Photoconductor Unit Kit (P/N 6190604)
- Cleaning Unit Kit (P/N 6190605)
- Xerographic Paper - letter size (8 reams (4K sheets)) (P/N 7034548); legal size (8 reams (4K sheets)) (P/N 7034550)

4224 PRINTER

THERE IS MORE THAN ONE TEXT VERSION FOR THIS DOCUMENT

PURPOSE

A serial dot matrix bidirectional impact printer for local and remote attachment to System/36 and System/38 for a variety of DP and WP applications. Multiple models offer speeds up to 400 CPS and color printing. Advanced print functions are implemented through the new Intelligent Printer Data Stream (IPDS).

MODELS 101, 102, 1E2, 1C2

Model 101: 200 CPS maximum (64K Memory)

Model 102: 400 CPS maximum (64K Memory)

Model 1E2: 400 CPS maximum - Expanded storage (512K Memory)

Model 1C2: 400 CPS maximum - Color and expanded storage (512K Memory)

Note: All models of the 4224 are capable of graphics printing; however if use of System/36 Business Graphics Utilities (BGU), Licensed Program (5727-BG1) for 5360 and 5362 System Units and (5727-BG6) for 5364 System Units, or if use of System/38 Business Graphics Utility, Licensed Program (5714-GP1), or System/38 GDDM is anticipated, it is recommended that a Model 1E2 (or 1C2) be ordered initially.

Prerequisites: Attachment/Requirement

System/36 (5360, 5362, 5364)

An available Workstation Controller position. The System/36 SSP must be at Release 4 or higher.

System/38 All Models

An available Workstation Controller-Extended position. The System/38 CPF must be at Release 8 or higher.

5294 Remote Control Unit

An available workstation position and Extended Function A (#3601). (Remote attachment to System/36 with SSP at Release 4 or higher, or to System/38 with CPS Release 8 or higher.)

Customer Setup (CSU): The 4224 is designated as a customer setup machine. Setup instructions are included with each machine.

HIGHLIGHTS

Two basic print speeds:

- 200 CPS (9 wire head)
- 400 CPS (18 wire head)

Three print quality modes and maximum print speeds:

Mode	Model 101	Model 102, 1E2, 1C2
DP	200 CPS	400 CPS
DP TEXT	100 CPS	200 CPS
NLQ	50 CPS	100 CPS

See "Throughput Considerations"

Print quality mode descriptions:

DP Mode - The character box is 9 dots high x 10 dots wide. The nominal DP character matrix is 7 dots high (0.098 in.) x 4 of 7 wide. Maximum character box height is 0.126 inches.

DP Text Mode - The dot density is doubled horizontally compared to DP mode. The character box is 9 dots high x 20 dots wide. The nominal DP Text character matrix is 7 dots high (0.098 in.) x 7 of 13 wide. Maximum character box height is 0.126 inches.

NLQ Mode (Near Letter Quality) - The dot density is doubled both horizontally and vertically compared to DP mode. The character box is 18 dots high x 20 dots wide. The nominal NLQ character matrix is 12 dots high (0.091 in.) x 7 of 13 wide. Maximum character box height is 0.133 inches.

- Vertical spacing of 6 and 8 lines per inch.
- Horizontal spacing of 10, 12, and 15 characters per inch. A special proportional font is available in DP TEXT and NLQ resulting in an average spacing of 11.5 characters per inch. Machines with serial number XX-F0001 and later also have 16.7 characters per inch in DP Mode only.
- Color printing (Model 1C2) is 4 or 8 colors as determined by ribbon type: (A 4 Color Primary ribbon is supplied with Model 1C2)
 - Accent Colors (4 Color Primary Ribbon): Black, Red, Blue, Green.
 - Subtractive Colors (8 Color Process Ribbon): Black, Yellow, Red, Magenta (Pink), Blue, Cyan (Turquoise), Green, Brown.
 - Two print passes are required to print the subtractive colors red, blue, green, and brown.
- A special longer life black ribbon may be installed in the Model 1C2 and conveniently exchanged by the operator for a color ribbon when color printing is required.
- Advanced print functions supported through the new Intelligent Printer Data Stream (IPDS) include vector graphics, resident bar codes, OCR A & B, raster image, and electronic forms (overlays).
- Bar codes supported by the 4224 are: 3 of 9 Code, MSI, UPC-A, UPC-E, UPC-2 Digit Magazine, UPC-5 Digit Magazine, EAN-8, EAN-13, 2 of 5 Industrial, 2 of 5 Matrix, 2 of 5 Interleaved, EAN-2 Digit Add-on, and EAN-5 Digit Add-on.
- Word processing functions include proportional spacing, sub/super script, and various emphasis capabilities (software dependent). Print quality, e.g., NLQ, is operator selectable and may be overridden by software.
- Print line max of 13.2 inches. Paper width from 3 inches to 15 inches (continuous forms).
- Up to four-part continuous forms may be used. Some five- and six-part forms may function satisfactorily but are not warranted by IBM.
- Direct attachment to IBM System/36 and IBM System/38 and to an IBM 5294 communicating with an IBM System/36 or System/38.
- Graphics printing at 144 x 144 dots per inch.
- Three operator changeable "forms modules" provide paper handling flexibility for continuous forms, document on demand, and document insertion (see "Special Features").
- Front loading and straight paper path provides operator convenience, added reliability, and reduction of multipart form "shingling".
- Advanced jam detection checks for paper motion when using continuous forms (Continuous Forms Device and Document

on Demand). Paper skew and insertion errors are detected when using cut forms (Document Insertion Device).

- Ribbon cartridge allows "clean hands" removal and installation.
- Operator replaceable printhead improves machine availability.
- Multi-function operator panel includes 3 position digital display.
- Cable-thru and termination are standard for twinax attachments through the use of a T-Connector assembly (included).
- Compact table top design will fit a variety of commercially available printer tables and stands.
- National Languages: National languages are selected via the operator panel. Available selections are:

Austria/Germany
Belgian
Brazil
Canadian French
Denmark/Norway
Finland/Sweden
France
International
Italy
Japan English
Japan Katakana
Portugal
Spain
Spanish Speaking
United Kingdom
USA/Canada

Physical Specifications:

Height: 267mm (10.5 in.)
Width: 642mm (25.3 in.)
Depth: 358mm (14.0 in.)
Weight: 22.68 kg (50 lb.)

System Attachment: An interface card and twinaxial connector for direct attachment to the System/36 (5360, 5362, 5364) Workstation Controller, the System/38 Workstation Controller-Extended and the IBM 5294 Remote Control Unit (An available workstation position and Extended Function A (#3601) is required on the 5294) is included with the 4224. Cable-thru and termination are standard through the use of a T-Connector included with the 4224. The host System/36 SSP must be at Release 4 or higher, and the host System/38 CPF must be at Release 8 or higher.

Compatibility Considerations: The 4224 is generally compatible with the IBM 5224 Printer when attached to System/36 or System/38. There are minor differences described in the "4224 Printer Product and Programming Description Manual", GC31-2551, along with comparisons of Operator Panel functions between the 4224 and the 5224, 5256, and 4214 that should be reviewed.

Throughput Considerations: The overall throughput depends on the print mode, application program, system response time, and the type of print operation being done. Any print operation that requires multiple passes or a reduction of horizontal dot spacing causes a reduction in the throughput.

Some print operations that affect throughput are:

Heavy print patterns
Line length (number of characters per line)
Subtractive color printing
Multiple colors on a single line
Bold printing, double strike printing, and other types of emphasis
Graphics printing

The 4224 uses an internal print management feature to guard against overheating the printhead due to the quantity of dots being

printed. During extended printing of dense lines (greater than 60% of possible character positions printed), this safe-guard may cause the print mechanism to slow down. The additional printing time, due to this slow down, lowers the overall throughput proportionally.

Intelligent Printer Data Stream (IPDS): IPDS is a structured field approach to management and control of printer processes and is designed to allow the presentation of text, raster images, vector graphics, bar codes and previously stored overlays at any point on a page. This structure allows data and commands to be sent to the device independently from the attachment protocol. This enables the same data stream to be used for printers attached by any method which supports transparent transmission of data.

IPDS commands within the data stream enable the host processor to control and manage the down loading of fonts, symbol sets, and stored objects, such as overlays and page segments. The printer can later use these stored objects to construct a printed page. IPDS can significantly reduce the load on the host processor and the number of characters transmitted to the printer in many advanced printing applications.

System/36 Programming Support: Programming support for the 4224 Printer is provided by Release 4.0 of the System/36 System Support Program (SSP) - Program Numbers 5727-SS1 (5360 and 5362) and 5727-SS6 (5364). In addition two (2) new System/36 PRPQs support advanced print functions and graphics:

PRPQ NAME: IPDS Advanced Function
5360 & 5362 5364

5799-CGK (P84094) 5799-CGL (P84095)

PRPQ NAME: IPDS Graphics/Text Merge
5360 & 5362 5364

5799-CGJ (P84096) 5799-CGP (P84097)

Most existing System/36 applications are supported on the 4224 printer with few or no changes required. The IBM System/36 Advanced Printer Function (APF) Licensed Program Product (5727-AP1, AP6) is not supported on the 4224 printer. Release 5.1 of the SSP and the IPDS Advanced Function PRPQ (P84094 or P84095) are required for support of 16.7 CPI.

The IPDS Advanced Functions PRPQ consists of subroutines that provide interfaces for use of IPDS functions from RPG, COBOL and Assembler. Functions include selection of printer options such as color and print quality, and printing bar codes and graphics.

The IPDS Graphics/Text Merge PRPQ provides support for merging an IPDS graphics file with a page prior to printing. Also included is a utility for printing an IPDS graphics file directly on the 4224. This utility is required for printing BGR graphs on the 4224.

IBM System/36 software support of the 4224 printer also includes:

- Operation Control Language (OCL) support of Lines Per Inch (LPI), quality selection (Near Letter Quality or the current operator selected 4224 default), and font selection.
- DisplayWrite/36 support of LPI, 3 levels of quality selection, font selection, bold printing, underscore, overstrike, subscript, superscript, justification and OCR A/B printing.

Refer to HONE for current and detailed PRPQ information.

System/38 Programming Support: The 4224 Printer is supported by IBM System/38 CPF (5714-SS1) Release 8. Software support includes Control Language (CL) support of lines per inch (lpi), quality selection, font selection including OCR fonts, and code page selection. Also included is DDS support of LPI, color designation, font selection including OCR fonts, bold printing, underscore, expanded characters, bar codes and code page selection.

Most existing applications are supported on the 4224 with few or no changes required. The System/38 Advanced Printer Function Utility (5714-UT2) is not supported on the 4224 Printer. System/38 Business Graphics Utility (5714-GP1) and GDDM printing is supported on the 4224 Printer.

Customer Responsibilities:

- Adequate site and system preparation. See "IBM 4224 Planning and Site Preparation", GC31-3625.
- Ordering, installing, and maintaining cables.
- Receipt at the customer's receiving dock, unpacking, and placement of the 4224 printer.
- Physical setup, setting configuration options, printer checkout, installation of forms device, and cable connections.
- Using and following the problem determination procedures before calling for IBM service.
- Ordering and replacing a worn printhead and ensuring that a functional printhead is available for problem determination purposes.
- Contacting IBM service to make cable connection to IBM non-CSU units where customer access areas are not provided.
- Ordering and replacing the ribbon cartridge.

Publications:

- Product & Programming Description (GC31-2551)
- Guide to Operations (GC31-3621)
- Operating Instructions (GC31-2546)
- Planning & Site Preparation (GC31-3625)
- Setup Instructions (GC31-3607)
- Maintenance Information (SC31-3541)
- Parts Catalog (SC31-3542)
- Intelligent Printer Data Stream (IPDS); Reference Manual (S544-3417)*

A special information binder is available, "4224 Printer Planning and Description Information", GC31-3605, which contains two key planning manuals conveniently packaged for presentation to customers:

- Planning and Site Preparation Manual (GC31-3625)
- Product and Programming Description Manual (GC31-2551)

Also see "KWIC Index", GA20-1621, and specific system bibliography.

* Planned availability is third quarter 1986.

SPECIFY

- Machines for AG-A/PG countries may either require low voltage (100 to 127V, 50/60 Hz, 1 phase) or high voltage (200 to 240V, 50/60 Hz, 1 phase) power supplies.
- When both low and high voltage machines are required in a particular country a specify feature must be used as follows:
 - #9200 for Low Voltage-120V (100V to 127V)
 - #9201 for High Voltage-220V (200V to 240V)
- The specific non-locking power plug is automatically selected by the Country Code of the order. A 2.8m (9 ft) power cord is provided. For Japan, specify type of power plug: #9250 for Non-locking, #9251 for Locking.

Forms Device:

- Specify one (only) at time of machine order
- Specify #9501 for Continuous Forms Device (#4001), or
- Specify #9502 for Document on Demand (#4002), or
- Specify #9503 for Document Insertion Device (#4003)
- See description of forms devices under "Special Features"

Also see "Ordering Information".

SPECIAL FEATURES

See "SPECIFY" for selection of one (1) forms device at time of machine order.

Additional forms devices must be ordered as Special Features. See (#4001, #4002, and #4003) below.

See "Product and Programming Description Manual" (GC31-2551), for form specifications and design information.

Continuous Forms Device (#4001): Provides an operator changeable "drop in" mechanism optimized for handling continuous forms. The right hand tractor is adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 3 inches to 14 inches. Up to six (6) part continuous forms may be used, however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Five (5) and six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Forms less than 6 inches in length or width and forms greater than 12.5 inches in length should be tested for satisfactory stacking. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4002 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document on Demand (#4002): Provides an operator changeable "drop in" mechanism for handling continuous forms. For applications requiring removal (tear off) of the individual printed form without feeding a blank form or waiting for another form to print. The right hand tractor and feed rolls are adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 3 inches to 14 inches. Up to six (6) part continuous forms may be used, however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Not for Model 1C2. Five (5) and six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Forms less than 6 inches in length or width and forms greater than 12.5 inches in length should be tested for satisfactory stacking. Applications requiring more than 6 forms to be fed before separation (tear off) should be tested for satisfactory operation. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document Insertion Device (#4003): Provides an operator changeable "drop in" mechanism to handle individually inserted forms. Includes a snap on guide for the left edge of the form. The right hand set of feed rolls is adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 7 inches to 14 inches. Limitations: Not for Model 1C2. Forms over 13 inches wide should be tested for satisfactory feeding and registration. Two (2) to six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Multipart form sets must not be fastened with staples, and must be glued only at the top edge securely enough to prevent form separation while passing through the printer. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4002). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

MODEL CONVERSIONS

Field conversions can be made from Model 102 to Model 1E2. No other conversions are possible. Not Customer Setup.

Note: All models of the 4224 are capable of graphics printing; however if use of System/36 Business Graphics Utilities (BGU), Licensed Program (5727-BG1) for 5360 and 5362 System Units and (5727-BG6) for 5364 System Units, or if use of System/38 Business Graphics Utility, Licensed Program (5714-GP1), or System/38 GDDM is anticipated, it is recommended that a Model 1E2 (or 1C2) be ordered initially.

Cables: The 4224 is connected to the System/36, System/38 or 5294 via twinaxial cable or shielded twisted pair cable. For information on twinaxial cabling see "IBM 5250 Information Display System Planning and Site Preparation Guide", GA21-9337. For information on twisted pair cabling see "IBM Cabling System-Planning and Installation Guide", GA27-3361.

The customer is responsible for ordering, installation and maintenance of these cables and their various parts. The attachment cables may be purchased from IBM or from a customer-selected source. When twinax cabling is ordered from IBM:

Twinax Cables for:	Assembled P/N	Bulk (No Connectors) P/N
Indoor/ outdoor	7362267	7362211 (note 1)
Plenum	7362062	7362061 (note 2, 4)

Connectors

Kit of two indoor/ outdoor cable connectors	P/N 7362268 (note 1)
Kit of two plenum cable connectors	P/N 7362063 (note 2)
Cable to Cable Adapter	P/N 7362230 (note 3, 4)
Insulation Tubing	P/N 483619 (note 4)
Twinaxial Station Protector	P/N 7361807 (note 5)

Notes:

1. The order must specify the desired length. One twinaxial connector kit, P/N 7362268, required for each cable. This is an indoor/outdoor cable. Two male connectors included.
2. The order must specify the desired length. One twinaxial connector kit, P/N 7362063, required for each cable. Two male connectors included.
3. Use to join two 7362267 or 7362262 cable assemblies together.
4. Must be used when connecting two Teflon covered cable assemblies P/N 7362062 together with adapter P/N 7362230.
5. The kit includes two protectors. One is required at the end of each twinaxial attachment cable installed outdoors (either above or below ground level). Individual twinaxial station protectors, P/N 7362426, are available for replacement purposes. The station protector is CSU.

Order the above items via MES from Poughkeepsie.

Ordering Information: Operating Instructions, Guide to Operations, Setup Instructions, and the Operator Panel overlay are shipped in the language required for a particular country as determined by the Country Code. Exceptions, such as countries with 2 or more languages will require Specify features as explained below.

Language	Countries
Spanish	Mexico, Guatemala, Honduras, Bolivia, Dominican Republic, El Salvador, Nicaragua, Ecuador, Argentina, Columbia, Paraguay, Venezuela, Uruguay, Panama, Costa Rica, Peru, Chile
Canadian French	Canada
English	Canada, Australia, New Zealand, Bahamas, Barbados, Jamaica,

4224 Printer

Philippines, Thailand, Netherlands Antilles, Taiwan, Malaysia, Singapore, Indonesia

Katakana Japan

Orders from Canada require a Specify feature for language as follows:

Specify #2934 for Canadian English
Specify #2935 for Canadian French

Specify codes are required for the following Languages:

Specify #2808 for Thai

Translated Publications:

ACCESSORIES

Forms Stand (#4450), (P/N 2526750): Provides for stacking of continuous forms on a stand after printing.

SUPPLIES

● Ribbon Cartridge

- P/N 6091849 Black - 14 mm (average 4 Million Char.) (Model 101, 102, 1E2)
- P/N 1040440 Black - 14 mm (average 6 Million Char.) (Model 101, 102, 1E2)
- P/N 6115549 Black - 27 mm (6 Million Char.) (Model 1C2 only)
- P/N 6115555 4 Color Primary (2.7 Million Char.) (Model 1C2 only)
- P/N 6115554 8 Color Process (2.7 Million Char.) (Model 1C2 only)

The above ribbon yields are derived from IBM conducted tests in DP Mode. Ribbon life experienced by the user may vary significantly depending on the users own quality criteria and on factors such as printer condition, machine settings, and paper quality.

Color ribbon yield was calculated as 1.2 million per black band plus 0.5 million for each of the three color bands.

● Printhead:

P/N 6091490 -- 9 Wire --- (Model 101 only)
P/N 6091449 -- 18 Wire --- (Model 102, 1E2, 1C2)

The life expectancy of the 9 wire printhead is 125 million DP characters and 250 million for the 18 wire printhead. Printhead life ex-

perienced by a user may vary significantly depending on the user's own quality criteria and on factors such as printer condition, machine settings, and ribbon used.

4224 PRINTER

PURPOSE

A serial dot matrix bidirectional impact printer for local attachment to Series/1 and System/88. Three levels of print quality combined with forms handling options and graphics capability makes the 4224 ideal for a variety of applications. Multiple models offer speeds up to 400 CPS and color printing. The Model 3C2 is not supported by System/88.

MODELS 301, 302, 3C2

Model 301: 200 CPS maximum (64K Memory)

Model 302: 400 CPS maximum (64K Memory)

Model 3C2: 400 CPS maximum - Color (512K Memory)

Prerequisites:

INTERFACE	SERIES/1 PROCESSOR FEATURES
RS-232-C or RS422-A	Multifunction Attachment (#1310)
RS-232-C	Feature Programmable 4-Line Adapter (#2095/2096)
	SYSTEM/88 PROCESSOR FEATURES
RS-232-C Local	Direct Connect Asynchronous Line Adapter (#1202)

Customer Setup (CSU): The 4224 is designated as a customer setup machine. Setup instructions are included with each machine.

HIGHLIGHTS

- Two basic rated print speeds:
 - 200 CPS (9 wire head)
 - 400 CPS (18 wire head)
- Three print quality modes and rated print speeds:

Mode	Model 301	Model 302 & 3C2
DP	200 CPS	400 CPS
DP TEXT	100 CPS	200 CPS
NLQ	50 CPS	100 CPS

See "Throughput Considerations"
- Print quality mode descriptions:
 - DP Mode** - The character box is 9 dots high by 10 dots wide. The nominal DP character matrix is 7 dots high (0.098 in.) x 4 of 7 wide. Maximum character box height is 0.126 inches.
 - DP Text Mode** - The dot density is doubled horizontally compared to DP mode. The character box is 9 dots high x 20 dots wide. The nominal DP Text character matrix is 7 dots high (0.098 in.) x 7 of 13 wide. Maximum character box height is 0.126 inches.
 - NLQ Mode (Near Letter Quality)** - The dot density is doubled both horizontally and vertically compared to DP mode. The character box is 18 dots high x 20 dots wide. The nominal NLQ character matrix is 12 dots high (0.091 inches) x 7 of 13 wide. Maximum character box height is 0.133 inches.
- Vertical spacing of 6 and 8 lines per inch.
- Horizontal spacing of 10, 12, and 15 characters per inch. A special proportional font is available in DP TEXT and NLQ resulting in an average spacing of 11.5 characters per inch. (Proportional font not available for PC Multilingual character set) Machines with serial number XX-F0001 and later also have 16.7 characters per inch in DP Mode only.
- Color printing (Model 3C2) is 4 or 8 colors as determined by ribbon type: (A 4-color Primary ribbon is supplied with Model 3C2)
 - Accent Colors (4-color Primary Ribbon): Black, red, blue, green.
 - Subtractive Colors (8 color Process Ribbon): Black, red, blue, green, yellow, magenta (pink), cyan (turquoise), brown.
- Two print passes are required to print the subtractive colors red, blue, green, and brown.
- A special longer life black ribbon may be installed in the Model 3C2 and conveniently exchanged by the operator for a color ribbon when color printing is required.
- Bar codes supported by the 4224 are: 3 of 9 Code, MSI, UPC-A, UPC-E, UPC-2 Digit Magazine, UPC-5 Digit Magazine, EAN-8, EAN-13, 2 of 5 Industrial, 2 of 5 Matrix, 2 of 5 Interleaved, EAN-2 Digit Add-on, and EAN-5 Digit Add-on.
- Word processing functions include proportional spacing, sub/super script, and various emphasis capabilities (software dependent). Print quality, e.g., NLQ, is operator selectable and may be overridden by software.
- Print line max of 13.2 inches. Paper width from 3 inches to 15 inches (continuous forms).
- Multipart forms up to 6 parts (including original).
- Direct attachment to IBM Series/1 Processors (except 4950 and 5170 System Units) via either EIA RS-232-C or RS-422-A interfaces and to System/88 via the RS-232-C interface.
- Data transfer rates of 300, 600, 1200, 2400, 4800, 9600, and 19200 baud are operator selectable to match the system rate.
- Graphics printing at 144 x 144 dots per inch.
- Three operator changeable "forms modules" provide paper handling flexibility for continuous forms, document on demand, and document insertion. (See SPECIAL FEATURES).
- Front loading and straight paper path provides operator convenience, added reliability, and reduction of multipart form "shingling".
- Advanced jam detection checks for paper motion when using continuous forms (Continuous Forms Device and Document on Demand). Paper skew and insertion errors are detected when using cut forms (Document Insertion Device).
- Ribbon cartridge allows "clean hands" removal and installation.
- Operator replaceable printhead improves machine availability.
- Multi-function operator panel includes 3 position digital display.
- Compact table top design will fit a variety of commercially available printer tables and stands.

- National Languages: National languages (EBCDIC) are selected via the operator panel. Available selections are:

Austria/Germany
Belgian
Brazil
Canadian French
Denmark/Norway
Finland/Sweden
France
International
Italy
Japan English
Japan Katakana
Portugal
Spain
Spanish Speaking
UK
US/Canada

Physical Specifications:

Height: 267mm (10.5 in.)
Width: 642mm (25.3 in.)
Depth: 358mm (14.0 in.)
Weight: 22.68 kg (50 lb.)

System Attachment: Series/1 Attachment - Local: The 4224-301, 302, and 3C2 attach to the Series/1 Multifunction Attachment (#1310) and the Feature Programmable 4-Line Adapter (#2095/2096).

Series/1 Features	RS-232-C	RS-422-A
----------------------	----------	----------

#1310	X	X
-------	---	---

#2095/2096	X	
------------	---	--

XON/XOFF pacing must be used to ensure data transfer integrity.

System/88 Attachment - Local: The 4224-301 and 302 attach to the System/88 Direct Connect Asynchronous Line Adapter (#1202).

System/88 Features	RS-232-C
-----------------------	----------

#1202	X
-------	---

Throughput Considerations: The overall throughput depends on the print mode, application program, system response time, and the type of print operation being done. Any print operation that requires multiple passes or a reduction of horizontal dot spacing causes a reduction in the throughput.

Some print operations that affect throughput are:

- Heavy print patterns
- Line length (number of characters per line)
- Subtractive color printing
- Multiple colors on a single line
- Bold printing, double strike printing, and other types of emphasis
- Graphics printing

The 4224 uses an internal print management feature to guard against overheating the printhead due to the quantity of dots being printed. During extended printing of dense lines (greater than 60% of possible character positions printed), this safe-guard may cause the print mechanism to slow down. The additional printing time, due to this slow down, lowers the overall throughput proportionally.

Programming Support: Programming support for the IBM 4224 Models 301, 302, and 3C2 is provided by Series/1 Realtime Programming System (RPS) Version 7.2 and Event Driven Executive (EDX) Version 5.2.

Event Driven Executive Version 5.2: Support for the 4224 is provided through Event Driven Language (EDL) instructions preprocessed by a compiler and prepared for execution (linked) by system utilities.

At execution time the compiled instructions are processed by the Supervisor/Emulator.

The PRINTTEXT instruction is used to write data to the printer. The data may be an explicit text message to be printed or direct I/O control (data streaming mode) of the printer.

The XLATE = YES parameter causes translation of character codes from EBCDIC to ASCII.

The XLATE = NO parameter allows an application to send data stream controls directly to the 4224 without interpretation by the Supervisor/Emulator. This allows the application to send the advanced function graphics, overlays, and page segment controls defined in the printer documentation.

The TERMCTRL instruction is used to request execution of special 4224 functions. TERMCTRL instructions are provided to:

- Print bar code
- Initialize or modify a font
- Down load printable images for specific code points
- Specify the new active font for subsequent printing
- Assign a specific character set to a font
- Delete a font from the printer storage
- Turn on and off continuous underscore mode
- Turn on and off continuous overscore mode
- Turn on and off italics mode
- Turn on and off double strike print mode
- Turn on and off double wide print mode
- Turn on and off bold (emphasized) print mode
- Turn on and off superscript or subscript print mode
- Specify the color of subsequent printing
- Specify print quality

Emulation of 4975 on 4224: A new System generation is required to add the 4224 printer to the operating system.

Applications must be re-linked to include a modified 4975 support module.

The Supervisor/Emulator intercepts and translates 4975 TERMCTRL instructions into 4224 instructions.

Recoding of applications is not required; however, the following differences apply:

The 4224 has a higher print density for DP Text and NLQ than the 4975.

The 4224 provides 10, 12 and 15, and 16.7 CPI (serial number XX-F0001 and later); the 4975 provides 10, 15 and 20 CPI.

Language selection on the 4224 is set offline as a configuration option.

The 4224 is a locally attached device only.

The DCB operand of the 4975 TERMCTRL instruction is not supported by the 4224 printer.

Utilities are available to set or change the state of the printer. Commands entered to execute 4224 utilities may differ from those for the 4975.

Pacing: Support is provided for XON/XOFF pacing at all baud rates using the RS-232 or RS-422 interface up to the maximum rates supported by the attachments.

Realtime Programming System Version 7.2: The 4224 printer is accessed using the WRITE macro:

Formatted WRITES are supported by the Print Spooler.

Formatted WRITES are intercepted by the 4224 Device Handler and transformed from the Series/1 Device Control Block into data stream controls (4975 like functions).

Unformatted WRITES are not supported by the Print Spooler.

Unformatted WRITES allow application generated data stream controls and text to be transmitted directly to the 4224 allowing

access to advanced function graphics, overlays, and page segment controls.

Support is provided for XON/XOFF data pacing at data rates up to 9600 baud with the asynchronous RS-422 interface via the Multi-function Attachment (#1310).

System/88: The 4224 Models 301 and 302 will be supported in the 4th Quarter 1986 with the then most current level of the System/88 Operating System (5732-001).

Customer Responsibilities:

- Adequate site and system preparation. See "IBM 4224 Planning and Site Preparation", GC31-3625.
- Ordering, installing, and maintaining cables.
- Receipt at the customer's receiving dock, unpacking, and placement of the 4224 printer.
- Physical setup, setting configuration options, printer checkout, installation of forms device, and cable connections.
- Using and following the problem determination procedures before calling for IBM service.
- Ordering and replacing a worn printhead and ensuring that a functional printhead is available for problem determination purposes.
- Contacting IBM service to make cable connection to IBM non-CSU units where customer access areas are not provided.
- Ordering and replacing the ribbon cartridge.

Publications:

- Product & Programming (ASCII) Description (GC31-2550)
- Guide to Operations (GC31-3621)
- Operating Instructions (GC31-2545)
- Planning & Site Preparation (GC31-3625)
- Setup Instructions (GC31-3607)
- Maintenance Information (SC31-3541)
- Parts Catalog (SC31-3542)

A special information binder is available, "4224 Printer Planning and Description Information", GC31-3706, which contains two key planning manuals conveniently packaged for presentation to customers:

- Planning and Site Preparation (GC31-3625)
- Product and Programming (ASCII) Description (GC31-2550)

Also see "KWIC Index", GA20-1621, and specific system bibliography.

SPECIFY

- Machines for AG-A/PG countries may either require low voltage (100 to 127V, 50/60 Hz, 1 phase) or high voltage (200 to 240V, 50/60 Hz, 1 phase) power supplies.
- When both low and high voltage machines are required in a particular country a specify feature must be used as follows:
 - #9200 for Low Voltage-120V (100v to 127v)
 - #9201 for High Voltage-220V (200v to 240v)
- The specific non-locking power plug is automatically selected by the Country Code of the order. A 2.8m (9 ft) power cord is provided.

For Japan- specify type of power plug:

- #9250 for Non-locking
- #9251 for Locking

Forms Device:

Specify one (only) at time of machine order

Specify #9501 for Continuous Forms Device (#4001) or
Specify #9502 for Document on Demand (#4002) or
Specify #9503 for Document Insertion Device (#4003)
See description of forms devices under SPECIAL FEATURES

Also see "Ordering Information".

SPECIAL FEATURES

See "SPECIFY" for selection of one (1) forms device at time of machine order.

Additional forms devices must be ordered as Special Features. See (#4001, #4002, and #4003) below.

See "Product and Programming (ASCII) Description Manual", GC31-2550, for form specifications and design information.

Continuous Forms Device (#4001): Provides an operator changeable "drop in" mechanism optimized for handling continuous forms. The right hand tractor is adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 3 inches to 14 inches. Up to six (6) part continuous forms may be used, however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Five (5) and six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Forms less than 6 inches in length or width and forms greater than 12.5 inches in length should be tested for satisfactory stacking. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4002 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document on Demand (#4002): Provides an operator changeable "drop in" mechanism for handling continuous forms. For applications requiring removal (tear off) of the individual printed form without feeding a blank form or waiting for another form to print. The right hand tractor and feed rolls are adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 3 inches to 14 inches. Up to six (6) part continuous forms may be used, however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Not for Model 3C2. Five (5) and six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Forms less than 6 inches in length or width and forms greater than 12.5 inches in length should be tested for satisfactory stacking. Applications requiring more than 6 forms to be fed before separation (tear off) should be tested for satisfactory operation. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document Insertion Device (#4003): Provides an operator changeable "drop in" mechanism to handle individually inserted forms. Includes a snap on guide for the left edge of the form. The right hand set of feed rolls is adjustable to accommodate forms width from 3 inches to 15 inches. Forms length can be from 7 inches to 14 inches. Limitations: Not for Model 3C2. Forms over 13 inches wide should be tested for satisfactory feeding and registration. Two (2) to six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Multipart form sets must not be fastened with staples, and must be glued only at the top edge securely enough to prevent form separation while passing through the printer. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4002). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Cables - Series/1: The 4224 may be attached to the Series/1 RS-232-C features using the Series/1 Asynchronous Local Attachment Communications Cable (#2056) in conjunction with EIA External Data Set Cable (P/N 5640736).

Attachment to the Series/1 RS-422-A features may be made using the 50 foot Series/1 Local RS-422 Cable (#5770).

IBM shielded twisted pair cable (or equivalent) may be used with the RS-422-A interface for distances up to 4,000 feet. This cable and associated accessories may be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

For proper identification, installation, and application of cable and associated accessories refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361 and/or "IBM Series/1 Customer Site Preparation Manual", GA34-0050. For pricing and ordering information, refer to the System Supplies operation within your country.

Cables - System/88: The 4224 may be attached to the System/88 communications adapters using Cables (#1802), (#1803), or (#1804) for direct connection to the RS-232-C interface.

ORDERING INFORMATION

Operating Instructions, Guide to Operations, Setup Instructions, and the Operator Panel overlay are shipped in the language required for a particular country as determined by the Country Code. Exceptions, such as countries with 2 or more languages will require Specify features or special model numbers as explained below.

Language	Countries
Spanish	Mexico, Guatemala, Honduras, Bolivia, Dominican Republic, El Salvador, Nicaragua, Ecuador, Argentina, Columbia, Paraguay, Venezuela, Uruguay, Panama, Costa Rica, Peru, Chile
Canadian French	Canada
English	Canada, Australia, New Zealand, Bahamas, Barbados, Jamaica, Philippines, Thailand, Netherlands Antilles, Taiwan, Malaysia, Singapore, Indonesia, Bermuda
Katakana	Japan

Orders from Canada require a Specify feature for language as follows:

Specify #2934 for Canadian English
Specify #2935 for Canadian French

Translated Publications:

MODEL CONVERSIONS (NONE)

ACCESSORIES

Forms Stand (#4450), (P/N 2526750): Provides for stacking of continuous forms on a stand after printing.

SUPPLIES

● Ribbon Cartridge:

- P/N 6091649 Black - 14 mm (average 4 Million Char.) (Model 301,302)
- P/N 1040440 Black - 14 mm (average 6 Million Char.) (Model 301,302)
- P/N 6115549 Black - 27 mm (6 Million Char.) (Model 3C2 only)
- P/N 6115555 4 Color Primary (2.7 Million Char.) (Model 3C2 only)
- P/N 6115554 8 Color Process (2.7 Million Char.) (Model 3C2 only)

The above ribbon yields are derived from IBM conducted tests in DP Mode. Ribbon life experienced by the user may vary significantly depending on the users own quality criteria and on factors such as printer condition, machine settings, and paper quality.

Color ribbon yield was calculated as 1.2 million per black band plus 0.5 million for each of the three color bands.

● Printhead:

P/N 6091490 -- 9 Wire -- (Model 301 only)
P/N 6091449 -- 18 Wire -- (Model 302, 3C2)

The life expectancy of the 9 wire printhead is 125 million DP characters and 250 million for the 18 wire printhead. Printhead life experienced by a user may vary significantly depending on the user's own quality criteria and on factors such as printer condition, machine settings, and ribbon used.

4224 PRINTER

PURPOSE

A serial dot matrix bidirectional impact printer for attachment to 3174/3274/3276 Control Units, 43XX Processors, 9370 Processor, and the 3694 Document Processor. Multiple models offer speeds up to 400 CPS and color printing. Advanced print functions are implemented through the new Intelligent Printer Data Stream (IPDS).

MODELS 201, 202, 2E2, 2C2

Model 201: 200 CPS maximum (64K Memory)

Model 202: 400 CPS maximum (64K Memory)

Model 2E2: 400 CPS maximum - Expanded storage (512K Memory)

Model 2C2: 400 CPS maximum - Color and expanded storage (512K Memory)

Note: GDDM graphics applications may not run satisfactorily on 4224 models without expanded storage. Therefore, the expanded storage models (2E2 and 2C2) are recommended and should be ordered initially if use of GDDM is planned.

Prerequisites:

ATTACHMENT	REQUIREMENT
Non-IPDS Mode	
3174 Subsystem Control Unit	An available terminal port
3274 Control Unit	An available Category A terminal port*
3276 Control Unit	An available terminal port
4321/31 Processor	An available position on the Display/Printer Adapter
4361 Processor	An available position on the Display/Printer Adapter or the Workstation Adapter
3694 Document Processor	An available position on the Device Cluster Adapter

* When attaching the IBM 4224 to an IBM 3274 Control Unit using Configuration Support D at Release 65.0, contact the

IBM 3274 National Service Division representative for support information; refer them to 3274 RETAIN TIP #756.

IPDS Mode

3174 Subsystem Control Unit	An available terminal port and Release 2 Microcode
3274 Control Unit	An available Category A terminal port and Configuration Support D Microcode at Release 65 or higher. Contact the IBM 3274 National Service Division representative for support information; refer them to 3274 RETAIN TIP #756.
4361 Processor	An available position on the Workstation Adapter and Specify #9261 installed
9370 Processor	Workstation Subsystem Controller (#6020)

SOFTWARE REQUIREMENTS:

Non-IPDS Mode

3268/3287 Compatibility (except PSS graphics) No special requirements

IPDS Mode

Graphics functions GDDM V2.1 under MVS/VM(Non-RSCS)/VSE

Customer Setup (CSU): The 4224 is designated as a customer setup machine. Setup instructions are included with each machine.

HIGHLIGHTS

- Two basic rated print speeds: 200 CPS (9 wire head); 400 CPS (18 wire head)
- Three print quality modes and rated print speeds:

Mode	Model 201	Models 202, 2E2, 2C2
DP	200 CPS	400 CPS
DP TEXT	100 CPS	200 CPS
NLQ	50 CPS	100 CPS

Note: See "Throughput Considerations"

● Print quality mode descriptions:

DP Mode - The character box is 9 dots high by 10 dots wide. The nominal DP character matrix is 7 dots high (2.49mm or 0.098 in.) by 4 of 7 wide. Maximum character box height is 3.20mm (0.126 in.).

DP Text Mode - The dot density is doubled horizontally compared to DP mode. The character box is 9 dots high by 20 dots wide. The nominal DP Text character matrix is 7 dots high (2.49mm or 0.098 in.) by 7 of 13 wide. Maximum character box height is 3.20mm (0.126 in.).

NLQ Mode (Near Letter Quality) - The dot density is doubled both horizontally and vertically compared to DP mode. The character box is 18 dots high by 20 dots wide. The nominal NLQ character matrix is 12 dots high (2.31mm or 0.091 in.) by 7 of 13 wide. Maximum character box height is 3.33mm (0.133 in.).

- Vertical spacing can be set for 3/4/6/8 lines per inch from the data stream or 6/8 lines per inch from the operator panel.
- Horizontal spacing of 10, 12, and 15 characters per inch. A special proportional font is available (when using the Intelligent Printer Data Stream) in DP TEXT and NLQ resulting in an average spacing of 11.5 characters per inch. Machines with serial number XX-F0001 and later also have 16.7 characters per inch in DP Mode only.
- Color printing (Model 2C2) is 4 or 8 colors as determined by ribbon type: (A 4 Color Primary ribbon is supplied with Model 2C2)

Accent Colors (4 Color Primary Ribbon): Black, Red, Blue, Green

Subtractive Colors (8 Color Process Ribbon: Black, Red, Blue, Green, Yellow, Magenta (Pink), Cyan (Turquoise), Brown

Two print passes are required to print the subtractive colors red, blue, green and brown.

- A special longer life black ribbon may be installed in the Model 2C2 and conveniently exchanged by the operator for a color ribbon when color printing is required.
- Advanced print functions, e.g., vector graphics, are supported through the new Intelligent Printer Data Stream (IPDS).
- Word processing functions include proportional spacing, sub/super script, and various emphasis capabilities (software dependent). Print quality, e.g., NLQ, is operator selectable and may be overridden by software.
- Print line max of 335.28mm (13.2 in.). Paper width from 76.2mm to 381.0mm (3 in. to 15 in.) (continuous forms).
- Multipart forms up to 6 parts (including original).
- Direct attachment to 3270 Control Units, 43XX Processors, and the 3694 Document Processor.
- Graphics printing at 144 x 144 dots per inch.
- Three operator changeable "forms modules" provide paper handling flexibility for continuous forms, document on demand, and document insertion. (See "Special Features").
- Front loading and straight paper path provides operator convenience, added reliability, and reduction of multipart form "shingling".
- Advanced jam detection checks for paper motion when using continuous forms (Continuous Forms Device and Document on Demand). Paper skew and insertion errors are detected when using cut forms (Document Insertion Device).
- Ribbon cartridge allows "clean hands" removal and installation.

- Operator replaceable printhead improves machine availability.
- Multi-function operator panel includes 3 position digital display.
- Compact table top design will fit a variety of commercially available printer tables and stands.

National Languages: National languages are selected via the operator panel. Available selections are:

Physical Specifications:

Height: 267mm (10.5 in.)
Width: 642mm (25.3 in.)
Depth: 358mm (14.0 in.)
Weight: 22.68kg (50 lb.)

Customer Responsibilities:

1. Adequate site and system preparation. See "IBM 4224 Planning and Site Preparation", GC31-3625.
2. Ordering, installing, and maintaining cables.
3. Receipt at the customer's receiving dock, unpacking, and placement of the 4224 printer.
4. Physical setup, setting configuration options, printer checkout, installation of forms device, and cable connections.
5. Using and following the problem determination procedures before calling for IBM service.
6. Ordering and replacing a worn printhead and ensuring that a functional printhead is available for problem determination purposes.
7. Contacting IBM service to make cable connection to IBM non-CSU units where customer access areas are not provided.
8. Ordering and replacing the ribbon cartridge.

Publications:

- Product & Programming Description GC31-2551
- Guide to Operations GC31-3621
- Operating Instructions GC31-2547
- Planning & Site Preparation GC31-3625
- Setup Instructions GC31-3607
- Maintenance Information SC31-3541
- Parts Catalog SC31-3542
- Intelligent Printer Data Stream (IPDS) Reference Manual S544-3417*

A special information binder is available, "4224 Printer Planning and Description Information", GC31-3605, which contains two key planning manuals conveniently packaged for presentation to customers:

- Planning and Site Preparation Manual (GC31-3625)
- Product and Programming Description Manual (GC31-2551)

Also see "KWIC Index", G320-1621, and specific system bibliography.

* Planned availability is third quarter 1986

Unit, 3276 Control Unit, the 4321/4332/4361 Processors (Display/Printer Adapter and Workstation Adapter), and the 3694 Document Processor. See "CABLES".

Compatibility Considerations: The 4224-2XX is data stream compatible with the 3268 and 3287 for non-graphics printing applications. There are minor differences described in the "4224 Printer Product and Programming Description Manual", GC31-2551, along with comparisons of Operator Panel functions between the 4224 and the 3268 and 3287 that should be reviewed. For example, the 4224 has no index key (3268) but does have vernier keys to move the forms up, down, and fast up. Fast up always moves the forms 1/6 of an inch. Unlike the 3268 and 3287, the 4224 does not support PSS graphics. Functional compatibility for graphics applications through IPDS is provided by GDDM Version 2.1. When selecting operator panel changes online (e.g., MPP or MPL), these changes are buffered and may not take effect immediately depending on the print job in process. Unlike the 3268/3287, overprinting of text can occur after Aborts, Buffer Reprints, and Cancels if the subsequent print job does not include an initial line feed. The 4224 does not support 16.7 characters per inch (3268). IPDS is available in SCS (SNA LU-1) and 3270 DSC (Non-SNA) environments only.

System Attachment: An interface card and coaxial connector for direct attachment to the 3174 Subsystem Control Unit, 3274 Control

Overlays/Ret. Segments	no	no	yes

AP = Through Application Program only

PS = Programmed Symbols

G = Supported by GDDM Version 2.1

* = Machines with serial number XX-F0001 and later

Throughput Considerations: The overall throughput depends on the print mode, application program, system response time, and the type of print operation being done. Any print operation that requires multiple passes or a reduction of horizontal dot spacing causes a reduction in the throughput.

Some print operations that affect throughput are:

- Heavy print patterns
- Line length (number of characters per line)
- Subtractive color printing
- Multiple colors on a single line
- Bold printing, double strike printing, and other types of emphasis
- Graphics printing

The 4224 uses an internal print management feature to guard against overheating the printhead due to the quantity of dots being printed. During extended printing of dense lines (greater than 60% of possible character positions printed), this safeguard may cause the print mechanism to slow down. The additional printing time, due to this slow down, lowers the overall throughput proportionally.

Intelligent Printer Data Stream (IPDS): IPDS is a structured field approach to management and control of printer processes and is designed to allow the presentation of text, raster images, vector graphics, bar codes and previously stored overlays at any point on a page. This structure allows data and commands to be sent to the device independently from the attachment protocol. This enables the same data stream to be used for printers attached to many different systems.

IPDS commands within the data stream enable the host processor to control and manage the downloading of fonts, symbol sets, and stored objects, such as overlays and page segments. The printer can later use these stored objects to construct a printed page. IPDS can significantly reduce the load on the host processor and the number of characters transmitted to the printer in many advanced printing applications.

Programming Support: Existing non-graphics printing applications for the 3268/3287 will support the 4224-2XX with no modification. The system programmer should configure the system as though a 3268 were installed. The 4224 is functionally compatible to the 3268 and 3287 printers except for the PSS command. The Graphical Data Display Manager (GDDM) Program Product Version 1, Release 4 uses the PSS command to support graphics and APA image printing applications with the 3268 and 3287. In order to achieve functional compatibility with the PSS command for these applications, GDDM Version 2, Release 1 must be used with the 4224. Other users of the PSS command must modify their programs to conform to the IPDS data stream which is used by the 4224 in all advanced function printing applications. The query reply will reflect 4224 characteristics which may be different from 3268 and 3287 information because of the additional functions supported. Although these replies will adhere to existing architectural format, applications using query replies may require modification because of these potential differences. The Product and Programming Description Manual, GC31-2551, will assist users in adapting their applications to take advantage of the advanced printing functions offered by the 4224, e.g., bar codes. GDDM Version 2, Release 1 will support the use of vector graphics in the IPDS data stream. Also supported are alphanumeric text, GDDM fonts, and user designed images.

SPECIFY

- Voltage: Machines for AG-A/PG countries may either require low voltage (100 to 127V, 50/60 Hz, 1 phase) or high voltage (200 to 240V, 50/60 Hz, 1 phase) power supplies.

When both low and high voltage machines are required in a particular country, a specify feature must be used as follows:

#9200 for Low Voltage-120V (100v to 127v)
#9201 for High Voltage-220V (200v to 240v)

- The specific non-locking power plug is automatically selected by the Country Code of the order. A 2.8m (9 ft) power cord is provided. For Japan specify type of power plug:

#9250 for Non-locking
#9251 for Locking

- Forms Device: Specify one (only) at time of machine order.

#9501 for Continuous Forms Device (#4001), or
#9502 for Document on Demand (#4002), or
#9503 for Document Insertion Device (#4003)

See description of forms devices under "SPECIAL FEATURES".

SPECIAL FEATURES

See "SPECIFY" for selection of one (1) forms device at time of machine order.

The Document on Demand (#4002) and Document Insertion Device (#4003) can not be installed on the Model 2C2 (color).

Additional forms devices must be ordered as Special Features. See (#4001, #4002, and #4003) below.

See Product and Programming Description Manual, GC31-2551, for form specifications and design information.

Continuous Forms Device (#4001): Provides an operator changeable "drop in" mechanism optimized for handling continuous forms. The right hand tractor is adjustable to accommodate forms width from 76.2mm to 381.0mm (3 in. to 15 in.). Forms length can be from 76.2mm to 355.6mm (3 in. to 14 in.). Up to six (6) part continuous forms may be used; however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Five (5) and six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Forms less than 152.4mm (6 in.) in length or width and forms greater than 317.5mm (12.5 in.) in length should be tested for satisfactory stacking. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4002 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document on Demand (#4002): Provides an operator changeable "drop in" mechanism for handling continuous forms. For applications requiring removal (tear off) of the individual printed form without feeding a blank form or waiting for another form to print. The right hand tractor and feed rolls are adjustable to accommodate forms width from 76.2mm to 381.0mm (3 in. to 15 in.). Forms length can be from 76.2mm to 355.6mm (3 in. to 14 in.). Up to six (6) part continuous forms may be used; however, for optimum feeding and stacking a maximum of four (4) parts is recommended. Limitations: Not for Model 2C2. Five (5) and six (6) part forms should be tested

for satisfactory feeding, registration, and print quality. Forms less than 152.4mm (6 in.) in length or width and forms greater than 317.5mm (12.5 in.) in length should be tested for satisfactory stacking. Applications requiring more than 6 forms to be fed before separation (tear off) should be tested for satisfactory operation. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Document Insertion Device (#4003): Provides an operator changeable "drop in" mechanism to handle individually inserted forms. Includes a snap-on guide for the left edge of the form. The right hand set of feed rolls is adjustable to accommodate forms width from 76.2mm to 381.0mm (3 in. to 15 in.). Forms length can be from 177.8mm to 355.6mm (7 in. to 14 in.). Limitations: Not for Model 2C2. Forms over 330.2mm (13 in.) wide should be tested for satisfactory feeding and registration. Two (2) to six (6) part forms should be tested for satisfactory feeding, registration, and print quality. Multipart form sets must not be fastened with staples, and must be glued only at the top edge securely enough to prevent form separation while passing through the printer. This feature cannot be installed in the 4224 simultaneously with other forms handling features (#4001 and #4002). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

MODEL CONVERSIONS

Field conversions can be made from Model 202 to Model 2E2. No other conversions are possible. Not Customer Setup.

Note: GDDM graphics applications may not run satisfactorily on 4224 models without expanded storage. Therefore, the expanded storage models (2E2 and 2C2) are recommended and should be ordered initially if use of GDDM is planned.

Cables: The 4224 is connected to the 3270, 43XX, 9370, or 3694 via coaxial cable or twisted pair cable. For information on coaxial cabling see "IBM 3270 Installation Manual- Physical Planning", GA27-2787. "Coaxial Cable and Accessories Manual", GA27-2805. For information on twisted pair cabling see "IBM Cabling System - Planning and Installation Guide", GA27-3361.

The customer is responsible for ordering, installation and maintenance of these cables and their various parts. The attachment cables may be purchased from IBM or from a customer-selected source. When coaxial cabling is ordered from IBM:

COAX CABLES FOR:	ASSEMBLED (P/N)	BULK (NO CONNECTORS) (P/N)
Indoor	2577672	0323921 (note 1)
Outdoor/Indoor	1833108	5252750 (note 2)
Plenum (Teflon)	4154741	4885584

Connectors:

- Kit of Two indoor cable connectors - P/N 1836418 (note 1)
- Kit of One indoor connector - P/N 1836444
- Kit of Two outdoor cable connectors - P/N 1836419 (note 2)
- Kit of One outdoor connector - P/N 1836447
- Kit of Two plenum cable connectors - P/N 1743508 (note 3)
- Kit of One plenum connector - P/N 4449035

Cable to Cable Adapter: P/N 5252643 (note 6)

Station Protectors:

- Kit for outdoor cable installation (includes two station protectors) - P/N 1830818 (note 4)
- Station protector attachment kit (includes two attachment adapters) - P/N 1833106 (note 5)
- Replacement station protector element (one connector) - P/N 5252899

Notes:

- Coax wire and connector kits (includes two connectors P/N 1836444). Required for each cable assembly.
- Coax wire and connector kits (includes two connector P/N 1836447). Required for each cable assembly.
- Coax wire and connector kits (includes two connector P/N 4449035). Required for each cable assembly.
- Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
- Use to attach outdoor cable to station protector. One kit is required for each cable assembly.
- Use to join two P/N 2577672 or two P/N 1833108 or two P/N 4154741 cable assemblies together.

Order the above items via MES from Poughkeepsie.

Ordering Information: Operating Instructions, Guide to Operations, Setup Instructions, and the Operator Panel overlay are shipped in the language required for a particular country as determined by the Country Code. Exceptions, such as countries with 2 or more languages will require Specify features or special model numbers as explained below.

Spanish -- Mexico, Guatemala, Honduras, Bolivia, Dominican Republic, El Salvador, Nicaragua, Ecuador, Argentina, Columbia, Paraguay, Venezuela, Uruguay, Panama, Costa Rica, Peru, Chile

Canadian French -- Canada

English -- Canada, Australia, New Zealand, Bahamas, Barbados, Jamaica, Philippines, Thailand, Netherlands Antilles, Taiwan, Malaysia, Singapore, Indonesia, Bermuda

Katakana -- Japan

Orders from Canada require a Specify feature for language as follows:

- Specify #2934 for Canadian English
- Specify #2935 for Canadian French

Specify codes are required for the following Languages:

- #2800 for Arabic X/Basic
- #2801 for Hebrew Bulletin
- #2802 for Icelandic
- #2803 for Greek
- #2804 for Turkish
- #2805 for ROECE Latin
- #2806 for Cyrillic
- #2807 for Yugoslav

MACHINES

GTO

64X8705

- P/N 6115555, 4 Color Primary (2.7 Million Char.) (Model 2C2 only)
- P/N 6115554, 8 Color Process (2.7 Million Char.) (Model 2C2 only)

ACCESSORIES

Forms Stand (#4450), (P/N 2526750): Provides for stacking of continuous forms on a stand after printing.

SUPPLIES

- Ribbon Cartridge:
 - P/N 6091649, Black - 14 mm (average 4 Million Char.) (Models 201, 202, 2E2)
 - P/N 1040440 Black - 14 mm (average 6 Million Char.) (Model 201, 202, 2E2)
 - P/N 6115549, Black - 27 mm (6 Million Char.) (Model 2C2 only)

The above ribbon yields are derived from IBM conducted tests in DP Mode. Ribbon life experienced by the user may vary significantly depending on the users own quality criteria and on factors such as printer condition, machine settings, and paper quality.

Color ribbon yield was calculated as 1.2 million per black band plus 0.5 million for each of the three color bands.

- Printhead:

P/N 6091490, 9 Wire (Model 201 only)
P/N 6091449, 18 Wire (Models 202, 2E2, 2C2)

The life expectancy of the 9 wire printhead is 125 million DP characters and 250 million for the 18 wire printhead. Printhead life experienced by a user may vary significantly depending on the user's own quality criteria and on factors such as printer condition, machine settings, and ribbon used.

4234 DOT BAND PRINTER

PURPOSE

Provides hard copy output for attachment to the S/36, S/38, 5294, 3274, (Canada only > 3694, <) and the 3276. The 4234 Printer also attaches to the) 4331 and 4361 Processors via the Display Printer Adapter and to the 4361 via the Work Station Adapter, and to the 9370 via the Workstation Subsystem Controller.

MODELS

Model 1 001: Attaches to the 3274, 3276, (Canada only > 3694, <) and Systems 4331/4361.

Model 2 002: Attaches to the System/36, System/38 and the 5294 Remote Controller communicating with a System/36 or System/38.

Prerequisites

Attachment Adapter on Control Unit

3274	Available Category A terminal port
3276	Available port or added #3255, #3256 or #3257
(Canada only > 3694	Available port or added #3101 (Device Cluster Adapter) <)
4331/4361	Available position on 4331 or 4361 Display Printer Adapter or an available position on the 4361 Work Station Adapter (SCS, and Character Print Operation are not supported on the 4331/4361). Specify code #9841 must be ordered on 4331 and specify code #9261 must be ordered on the 4361.
S/36	The 4234 Printer may be attached to the S/36, S/38, and the 5294 via user-provided twinaxial cable or the IBM Cabling System. See "IBM 5250 Information Display System Planning and Site Preparation Guide", GA21-9337 for cabling information.
S/38	
5294	
9370	Workstation Subsystem Controller (#6020)

Customer Setup (CSU): The 4234 Printer is designated as customer setup thereby offering the customer early availability and relocation flexibility. For additional information on CSU, refer to the GI section of the IBM Sales Manual.

HIGHLIGHTS

The 4234 Printer is a monochromatic dot band matrix line printer designed to operate in a semi-attended environment. The printer is floor standing, bottom forms loading and prints at a maximum speed of 410 lpm when printing in DRAFT mode, 300 lpm in DATA PROCESSING mode, and 120 lpm in NEAR LETTER QUALITY mode. It has a customer changeable print band allowing selection of different dot

sizes to best match the printer application. The dot size diameter can be 0.304, 0.406, 0.508mm (0.012, 0.016, or 0.020 inches) (one dot size per band). Smaller dot sizes for higher quality printing; larger dot sizes for higher speed draft printing. The printers are shipped with a 0.406mm (0.016 inch) dot size print band. Additional bands, either replacement or alternate element sizes, can be ordered as normal supply items.

On the 4234 Printer mdl 1, lines per inch (lpi) and characters per inch (cpi) are selectable at the operator panel or via the data stream control, when supported by the host system. Print Quality Select is controlled at the operator panel only. APL/TEXT is a standard function.

On the 4234 Printer mdl 2, lpi and cpi are supported from the host only and cannot be set at the operator panel. Print Quality select is controlled at the operator panel, but can be overridden by the host.

On both models, the vertical spacing is 25.4mm (3, 4, 6, or 8 lpi) plus 9 lpi for mdl 2 graphics. Dual Case Operation, Audible Alarm, and Cancel Print are provided as standard functions. The acoustical ratings are a very quiet 57db A, 58db AI, when printing and 44db A when idling.

Continuous forms are fed by a Variable Width Forms Tractor which accepts forms up to 406.4mm (16 in.) wide. The maximum forms length that can be accommodated is 355.6mm (14 in.). However, when using forms longer than 317.5mm (12.5 in.) the front door of the printer stand must be left open. When the door is open the acoustical level will be higher. Up to 6-part forms may be used. Forms of 5 or 6 parts should be tested on an individual basis for acceptable feeding, registration and print quality.

For forms design considerations refer to Appendix B of the "4234 Dot Band Printer Product and Programming Description", GC31-2554.

A 13.2 inch print line is standard. 10 and 15 characters per inch (cpi) provide 132 and 198 characters per line respectively.

The following print quality levels may be selected: (The maximum speeds indicated are when printing upper case non-accented characters.)

Draft	45 of 90 dpi* horizontal by 48 dpi* vertical. Upper case only. (Character height is 5 dots). Maximum of 410 lpm.
Data Processing	45 of 90 dpi* horizontal by 72 dpi* vertical (character height is 7 dots). Maximum of 300 lpm.
Near Letter Quality	90 of 90 dpi* horizontal by 96 dpi* vertical (character height is 9 dots). Maximum of 120 lpm.

* dpi = dots per inch.

Note: The speeds and dpi densities are based on printing at 10 cpi and 6 lpi.

Because of the 4234 Printer's unique capability to allow the operator to change the print dot size, the resolution can be optimized at various speeds and print qualities to help meet the customers' requirements. The 0.406mm (0.016 in.) dot band is considered the standard general purpose band.

To assist the IBM Marketing Representatives in providing the proper documentation to the customers, a three ring binder "De-

scription and Planning Package" is available that includes the following 4234 Printer documents:

- Planning and Site Preparation
- Product and Programming Description
- Principles of Operations.

The kit is intended for the IBM Marketing Representatives and the individual books are available to the customers.

A black ribbon cartridge, P/N 6295158, and a print band with 0.406mm (0.016 in.) dot print-elements, P/N 6275528, will be shipped with each printer.

Physical Specifications

Height - 958mm (37.75 inches)
Width - 660mm (26.0 inches)
Depth - 765mm (30.25 inches)

The above measurements include the printer and the stand. A stand is shipped with every printer.

Programming Support: The 4234 Printer mdl 1 is supported on the 3274/3276 and the 4361 Work Station Adapter, similar to a 3262 Printer, and is compatible with the 3262 support. On the 4331/4361 the 4234 is supported on the Display/Printer Adapter as a 3287. The system programmer should configure the system as though a 3287 were attached.

The 4234 Printer mdl 2 is supported on the S/36 with Releases 3 and 4. With Release 3, the 4234 is configured as a 5225 Printer and software control of print quality is not supported. With Release 4, the 4234 is configured as a unique device, with OCL (Operator Control Language) control of print quality in addition to 5224/5225 equivalent OCL support.

Printing of graphics at 15 CPI is not supported for the System/36 Advanced Printer Function (5727-AP1/AP6). Advanced Printer Function graphics output which can be printed at 10 cpi is supported. System/36 Business Graphics Utilities (5727-BG1/BG6) printing is not supported on the 4234 printer.

The 4234 mdl 2 is supported on the S/38 with Release 7. Included is 5224/5225 equivalent support with CL (Control Language), print quality control with CL, and graphics printing with System/38 Business Graphics Utility (5714-GP1) and GDDM.

Printer of graphics at 15 cpi is not supported for the IBM System/38 Advanced Printer Function Utility (5714-UT2). Advanced Printer Function graphics output which can be printed at 10 cpi is supported.

Problem Determination Procedure: Significant function has been designed into this unit to provide greater availability to the customer. This has been done by the use of problem determination and recovery routines and procedures that can be understood and used by the casual operator. See "Customer Responsibilities" below.

Performance Considerations: Printer throughput is dependent upon operational and system characteristics. Factors such as host and controller configurations, line transmission speed, output format, and program application processing must all be considered in determining actual throughput.

In addition to printer mode (Draft, Data Processing, or Near-Letter Quality), characters per inch (cpi), and, in some cases, average line length, actual printer throughput is furthermore dependent upon system configuration, operational environment, and other document and programming characteristics.

The FIVE 3270 SE Aid (mdl 1 only) is available to estimate performance for the particular environment in which the 4234 Printer will be installed. Use of this aid is essential for understanding the effects of transmission speed, data stream protocol, and message sizes on printer throughput.

Mdl 1 Performance Considerations:

When attaching to a 3274 control unit, printer throughput (in lpm) may be affected by whether the 3274 is a local or remote model; for

remote control units, the protocol (BSC or SDLC) and transmission line speed; the operations by other devices attached to the 3274 control unit; and the data stream protocol (DSC, DSE, (LU3), or LU1 mode).

Print Speeds (Lines Per Minute)

Mdl 1 - Maximum print speeds for the 4234 mdl 1 when printing at 6 lpi, upper case*, (and LU1 mode).

	Draft	Data Processing	Near Letter Quality
CPI	10 15	10 15	10 15
Mdl 1	410** (325)	125 300 85	120 60

Mdl 2 - When printing at 6 lpi, alphanumeric, upper case.

	Draft	Data Processing	Near Letter Quality
CPI	10 15	10 15	10 15
Mdl 2	410 (345) ***	125 300 85	120 60

* Mixed case output will decrease throughput by approximately 10 percent.

** When printing 80-132 cpl in Draft mode, throughput decreases from 410 to 325 lpm for the mdl 1.

*** When printing 80-132 cpl in Draft mode, the mdl 2 throughput decreases from 410 to 345 lpm. All other throughputs are insensitive to line length.

The following performance comparison was run by IBM using a job mix of 22 typical customer applications. The printing was at 6 lpi, 10 cpi, in DP print mode.

Printer	Relative Performance
4234-2	1.0
5224-2	0.6
5225-1	0.7
5225-2	1.0
5225-3	1.2

Customer Responsibilities: The customer is responsible for:

- Adequate site, system and other vendor preparation
- Receipt at the customer's receiving dock, unpacking and placement of the 4234 Dot Band Printer printer.
- Physical setup, connection of cables, switch settings and printer checkout.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for IBM service.
- Contact Customer Engineering to make cable connection of IBM CSU units to IBM non-CSU units where access areas are not provided.
- Changing ribbons.
- Changing print bands.
- Cleaning print band and ribbon shield.

Publications: See "KWIC Index", GA20-1621, or specific system bibliography.

Customer Publications:

- Customer Setup Instructions, GC31-2552
- Principles of Operations, GC31-2553
- Product and Programming Description, GC31-2554
- Planning and Site Preparation Guide, GC31-2555
- Operating Instructions for Model 1, GC31-2556
- Operating Instructions for Model 2, GC31-2557
- Description and Planning Package, GC31-0058

Language: National Use Character Sets are selected via the operator panel for mdl 1 and 2. The selection can also be made via the SCGL SCS command from the host for the mdl 2. Character Sets which may be selected include:

Brazilian
Canadian Bilingual
US English
UK English
French
International
Japanese English
Katakana
Portuguese
Spanish Speaking

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

SPECIFY

- Additional Languages Supported: There is no additional charge for the specify codes.

Mdl 2

Support for the following languages on the 4234 Printer mdl 2 will be by a new release of PSH RPQs 8D0223 for the S/36 attach and 8D0224 for the S/38 attach: Thai.

See the RPQ description and price transmittal for features and limitations of this support.

These languages are ordered as model number L02. A specify feature code is not required.

- For the correct power plug and receptacle, refer to the "IBM 4234 Dot Band Printer Planning and Site Preparation Guide".
- Power, nomenclature, model: (One specify in 50 or 60 Hz chart selects all three.)

Freq.	Power Volts	Operator Panel Language	Mdl	Specify

ACCESSORIES (NONE)

CABLES

Coax: The IBM cabling system or the coax cables and/or associated parts to attach the 4234 Printers to 3274s, 3276s, 3694s, (or Local Display Adapter (#4702) on the 3276,) or the 4331/4361/systems, or 9370 Processors, may be purchased from IBM or from a customer-selected source. For the proper identification, installation, and application of the subject cables and parts, see "IBM 3270 Installation Manual- Physical Planning", GA27-2787, and "Coaxial Cable and Accessories Manual", GA27-2805. The customer is responsible for installation and maintenance of these cables and their associated parts.

Coax Cables for:	Assembled (P/N)	Bulk (No Connectors) (P/N)
Indoor	2577672	0323921 (note 1)
Outdoor/Indoor	1833108	5252750 (note 2)
Plenum (Teflon)	4154741	4885584
Connectors	Part Number	
Kit of two indoor cable connectors	1836418 (note 1)	
One indoor connector	1836444	
Kit of two outdoor cable connectors	1836419 (note 2)	
One outdoor connector	1836447	
Kit of two plenum cable connectors	1743508 (note 3)	
One plenum connector	4449035	
Cable to cable adapter	5252643 (note 6)	

MACHINES

Station Protectors

Kit for outdoor
cable install.
(includes two
station
protectors) 1830818 (note 4)
Station protector
attachment kit
(includes two
attachment
adapters) 1833106 (note 5)
Replacement
station protector
element (one
connector) 5252899

Notes:

1. Coax wire and connector kits (includes two connectors P/N 1836444). Required for each cable assembly.
2. Coax wire and connector kits (includes two connectors P/N 1836447). Required for each cable assembly.
3. Coax wire and connector kits (includes two connectors P/N 4449035). Required for each cable assembly.
4. Must be used with outdoor cable assembly when installed outdoors (either above or below ground level). One kit required for each cable assembly.
5. Used to attach outdoor cable to station protector. One kit is required for each cable assembly.
6. Used to join two P/N 2577672 or two P/N 1833108 or two P/N 4154741 cable assemblies together.

Order the above items via MES from Poughkeepsie.

Twinax: The IBM cabling system or the Twinax cables and/or associated parts for attachment to S/36, S/38, and the 5294 may be purchased from IBM or from a customer-selected source. For description of these cables and parts, see "IBM 5250 Information Display System Planning and Site Preparation Guide", GA21-9337 or "IBM 5280 Cable Assembly Manual", GA21-9341. The customer is responsible for the installation and maintenance of these cables and their associated parts. When cabling is ordered from IBM:

Twinax Cables for:	Assembled (P/N)	Bulk (No Connectors) (P/N)
Indoor/Outdoor	7362267	7362211 (note 1)
Plenum	7362062	7362061 (notes 2, 4)

Connectors

Kit of two
indoor/outdoor
cable
connectors 7362268 (note 1)
Kit of two
plenum cable

connectors	7362063 (note 2)
Cable to cable adapter	7362230 (notes 3,4)
Insulation tubing	483619 (note 4)
Twinaxial station protector	7361807 (note 5)

Notes:

1. The order must specify the desired length. One twinaxial connector kit, P/N 7362268, required for each cable. This is an indoor/outdoor cable. Two male connectors included.
2. The order must specify the desired length. One twinaxial connector kit, P/N 7362063, required for each cable. Two male connectors included.
3. Used to join two 7362267 or 7362262 cable assemblies together.
4. Must be used when connecting two Teflon covered cable assemblies P/N 7362062 together with adapter P/N 7362230.
5. The kit includes two protectors. One is required at the end of each twinaxial attachment cable installed outdoors (either above or below ground level). Individual twinaxial station protectors, P/N 7362426, are available for replacement purposes. The station protector is a CSU.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 6295158 or equivalent is required. The ribbon cartridge has a print life of approximately 20 million characters, when printing in Data Processing mode and using the .016 dot band. Ribbon print life is derived from IBM conducted tests. Ribbon life experienced by a user may vary significantly depending on the user's own quality criteria and on factors such as printer condition, machine settings and paper quality.

Print Bands: Allows the customer to purchase additional print bands with different print dot sizes. The following dot element sizes are available:

Size	P/N	Description
304mm (0.012 in.) dot	6275527	For optimizing the quality of Near Letter Quality Printing.
406mm (0.016 in.) dot	6275528	General Purpose Printing.
508mm (0.020 in.) dot	6275529	For optimizing the quality of Draft printing.

For additional information regarding supplies refer to your country DP Supplies Coordinator.

4245 LINE PRINTER

PURPOSE

Printer Output Unit: The 4245 Models 12 and 20 channel-attaches to virtual storage S/370 Models 148, 158, and 168, 303X, 308X, 3090, all 4300 Processors, and System/38 (5381 and 5382). The 4245 Models D12 and D20 attach to the 3274, 4700 Finance Systems, 4361 WSA (workstation adapter), 4361 DPA (display/printer adapter), and the 9370 Processor via Workstation Subsystem Controller. The 4245 Models T12 and T20 attach via a Twinax interface to the System/36 and the System/38. Print speeds are 1,200 and 2,000 lines per minute (lpm) based on a standard 48-character set.

MODELS

Model 1 001: (NO LONGER AVAILABLE) Print speed 2,000 lpm.

Model 12 012: Print speed 1,200 lpm. This model channel-attaches to virtual storage S/370 Models 148, 158, and 168, 303X, 308X, 3090, all 4300 Processors, and System/38 (5381 and 5382).

Model 20 020: Print speed 2,000 lpm. This model channel-attaches to virtual storage S/370 Models 148, 158, and 168, 303X, 308X, 3090, all 4300 Processors, and System/38 (5381 and 5382).

Model D12 D12: Print speed 1,200 lpm. This model attaches to the 3274, 4700 Finance Systems, 4361 WSA (workstation adapter), 4361 DPA (display/printer adapter), and the 9370 Processor via Workstation Subsystem Controller.

Model D20 D20: Print speed 2,000 lpm. This model attaches to the 3274, 4700 Finance Systems, 4361 WSA (workstation adapter), 4361 DPA (display/printer adapter), and the 9370 Processor via Workstation Subsystem Controller.

Model T12 T12: Print speed 1,200 lpm. This model attaches via a Twinax interface to the System/36 and the System/38.

Model T20 T20: Print speed 2,000 lpm. This model attaches via a Twinax interface to the System/36 and the System/38.

Limitations:

- Only marginally punched, pinfeed, continuous forms may be used. For multiple part forms it is recommended that both sides be securely fastened. However, when only one side is fastened it must be the right side.
- For full flexibility of column locations for margins, 451mm (17.8 in.) maximum width forms are recommended. If forms greater than 356mm (14 in.) in length are used, the rear stacker enclosure must be opened. If forms greater than 432mm (17 in.) in length are used, the front forms compartment door must be left open. For additional information, see "Forms Design Reference Guide for Printers", GA24-3488.
- No staples are permitted in the area exposed to the print band.
- Both edges of the form must be engaged by the pinfeed forms tractors.
- All 4245 models except model 1 may be used to generate input in OCR applications (see "Supplies" section for ribbon recommendations). Multiple-part forms are not recommended for OCR printing. The print quality of the top sheet is affected by the underlying sheets. Under no circumstances should the copy sheets be used for optical scanning. For best results use 75-90 g/sq.m (20-24 lb.) OCR bond in single-part form for printing. OCR form utilizing other papers should be tested for satisfactory results with user requirements. When reading 4245 documents on the 3886, reread on reject capability and 3211/5211 compatibility (#9701) should be used on the 3886.

For OCR-B, in addition to OCR numerics, only four specials (less than, greater than, plus and diagonal), and the 10 letters used by the ECMA (European Computer Manufacturing Association) and NRMA (National Retail Merchants Association) have been qualified in readability performance. These 10 letters are: A, C, E, N, P, R, S, T, V, X.

- Print quality and printer operation (such as forms feeding and stacking) varies with paper specifications, number of copies, ribbons, and environmental conditions (temperature and humidity).

Forms of more than four parts or forms with a first part heavier than 49 grams/sq. meter (13 pounds) should be tested under operating conditions to verify that results are satisfactory for the user applications. The maximum forms thickness is 0.51mm (0.020 in.).

(Japan only) Carbon forms of more than four parts or carbonless forms of more than five parts (Models 12, D12, and T12); carbon forms of more than three parts or carbonless forms of more than four parts (Models 20, D20, and T20) should be tested under operating conditions to verify that results are satisfactory. <)

Prerequisites:

- One operator changeable print band for each 4245 printer (see "Specify" section).
- One control unit position on a system byte multiplexer, selector, or block multiplexer channel for each mdl 1, 12, 20 printer. A maximum of two 4245 Models 12 or 20 (or 3203 Model 5) can be attached to a System/38. See M5381 "Special Features" for attachment explanation.
- Models D12 and D20 attach via 3174, 3274, 4700 communication controllers, 4361 WSA or DPA as terminal or system printers, or System/38. Attachment as a 4361 system printer requires specify feature #9160 on the printer. See M4361 pages for additional prerequisites.
- Attachment of Models T12 and T20 to System/36 requires software Release 4 or later. Attachment of Models T12 and T20 to System/38 requires Release 7 or later release.

HIGHLIGHTS

Print speeds are 1,200 and 2,000 lpm using a 48-character interchangeable print band. A variety of other character sets are available. Print speeds vary according to the size of the character set. The following table shows character sizes offered and expected speed ratings:

Character Set	Models 12, D12, T12	Models 20, D20, T20
48	1,200	2,000
48 (OCR)	1,200	2,000/1,906*
52	1,120	1,790
50, 63	980	1,570
94, 98	640	1,050
124	445	745
116	640	1,050
108, 127, 142	445	745
124	445	745

* There is one set of OCR bands for use on any of the models. This set provides for higher OCR speed of 2,000 lpm. There is also an additional set of OCR bands specially designed for the Models 20, D20, and T20, providing better OCR print quality at 1,906 lpm.

Print speed depends on frequency of use of various characters. Most 4245 print bands have been optimized to add greater fre-

quency of commonly used characters. This enables most print jobs to run faster than if the frequency of all characters was equal.

132 print positions is standard. Horizontal spacing is 10 characters per inch. Vertical spacing is 6 or 8 lines per inch under program control (except System/36 Release 4 which is manual only). The carriage is a dual-speed unit with normal skipping up to 0.61m (24 in.) per second and high-speed skipping up to 1.4m (55 in.) per second after six lines have passed. The output forms stacker is power-assisted.

Continuous marginally punched forms are fed by a pair of forms tractors. Maximum forms dimensions are: Width - 559mm (22 in.); length - 610mm (24 in.). Minimum forms dimensions are: Width - 89mm (3.5 in.); length 76mm (3.0 in.).

Note: In the stacker, the minimum fold-to-fold length is 152mm (6.0 in.).

Models D12 and D20:

Performance Considerations: Actual printer throughput and the number of printers attachable to the 3174 or 3274 Control Unit, 4701 or 4702 Finance Communication Controller or 4361 Processor Workstation Adapter or Display/Printer Adapter is dependent upon the system configuration, the operational environment and programming characteristics, including document characteristics. The following factors must be considered in determining actual throughput:

- System Configuration:
 - Local or remote 3174 or 3274 control unit
 - SNA or non-SNA environment
 - Other devices attached to the 3174 or 3274 Control Unit, 4701 or 4702 Finance Communication Controller, or 4361 Processor Workstation Adapter or Display/Printer Adapter.
- For Remote 3174s, 3274s or 4700s:
 - Communication Protocol (BSC/SDLC)
 - Transmission line speed
- Application processing and Document Characteristics:
 - Data organization
 - Output format: skipping, spacing, print line length
 - Character set size of print band application program

To determine whether the 4245 printer can achieve the desired throughput for a given situation, an initial estimate of anticipated throughput should be made on the basis of the speed of the desired printer model (Mdl D12 or D20) using the selected character set size (48, 64, etc.), and considerations of the output format for the document to be printed (as defined by average number of characters per line and lines skipped).

The output format translates into the character rate that is required when running at the desired speed. This character rate requirement will give a rough idea of the possible effects on printer throughput of other transactions processed by the 4361 Processor Workstation Adapter and, conversely, will help assess the significance of 4245 printer operations on the performance of other transactions processed by the 4361 Processor Workstation Adapter.

The character rate is especially important for remote 3174, 3274 or 4701 subsystems. Comparison of this character rate with available TP-link capacity (e.g., a maximum of 1,200 characters can be transmitted per second on a 100 percent utilized 9600 bps line) will show whether it is feasible to run the selected printer at its desired speed.

Model D12 and D20 Performance Characteristics: In addition to the performance considerations listed above, the 4245 mdls D12 and D20 are sensitive to data stream characteristics. Optimum throughput can be achieved using SNA LU-1 Data Streams. Significantly less than maximum rated speeds may be experienced when using BSC or DSC (SNA LU-3) Data Streams. Refer to the "Information Manual (Operator's Guide)", GA33-1586, for additional details.

Recommendations:

- Run the 4245 D models in SCS LU-1 mode:
- In the VM/RSCS environment, RU=1,024, Pacing=2, VPacing=4 is a good starting point. RSCS Version 2 is recommended. It is best to use a dedicated RSCS Virtual Machine for the 4245 printer(s).
- In the MVS/JES328X environment, RU=1,280, Pacing=1, VPacing=5 is a good starting point. JES328X Version 2 is recommended. If PTF UB00879 is installed on JES328X Version 2, define the 4245 D model as a 4245 to JES328X and data compression will take place. If Version 1 is used or Version 2 without the PTF, define the 4245 D model as a 3262. Set the JES checkpoint page value to the 20-30 range. This has a performance versus error recovery trade-off the customer will have to make.
- If running in DSC mode, it is recommended that the Early Print Complete be activated in the printer for performance considerations. Again, this has performance versus error recovery implications that the customer will have to address.
- If running in DSE mode, it is recommended that LU1/SCS mode be used instead.
- It is highly recommended for remote installations, in either software environment, to use a dedicated line and dedicated 3174/3274. A minimum of 19.2KB line is recommended for a D12 and 56KB for a D20.

Software Support: The 4245 Models 12 and 20 can be run in native or compatibility mode. The mode of operation must be reflected in the operating system's I/O table. This may require an I/O generation. There are two compatibility modes: 1) 3211 for MVS and MVS/XA, and 2) 3262 Model 1 for VM and DOS/VSE.

MVS, VM, and DOS/VSE require that the image library contain Form Control Buffers (FCBs) for various print applications. For MVS, a new image library member must be created. When migrating applications from printers that use carriage control tapes, an FCB must be created that is equivalent to the carriage control tape. Otherwise, existing FCBs may be used. Note: JES2 requires a channel 1 in the first position of the FCB.

Customers should contact the IBM Support Center for all applicable PTF information. Related software product areas such as DFP and MVS/JES should be searched for PTFs as well.

Software support levels are shown in the chart below:

Native Modes:

Oper. System	Minimum Level Required	Opt. Prod. Minimum Lvl. Required
DOS/VSE	VSE/AF 1.3.5 SIPO E 1.4.0 4245-12,20=PRT 1	POWER 2.1.0
VM/SP	SP3	HPO 3.2
OS/VS1	BPE4 and DFDS 1.2	
MVS/SP 370	MVS 1.3.4 and DFP 1.1	JES2 1.3.4 JES3 1.3.4
MVS/SP XA	MVS 2.1.2 and DFP XA 2.1	JES2 1.3.4 JES3 1.3.4

Compatibility Modes:

Oper. System	Minimum Level Required	Opt. Prod. Minimum Lvl. Required

DOS/VSE	4245-12/20=PRT 1 (3262-01) VSE/AF 1.3.1 SIPO E 1.3.1*	POWER 1.2.0
VM/SP	4245-12/20 = 3262-01 SP2 SP3	HPO 3.2
MVS/SP 370	4245-12/20 = 3211 MVS 1.3.0	DFP 1.0 JES2 1.3.0 JES3 1.3.0
MVS/DP XA	4245-12/20 = 3211 MVS 2.1.1	DFP/XA 1.1 JES2 1.3.0 JES3 1.3.0

* Contains VSE/AF 1.3.1 and VSE/POWER 1.2.0

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system, and other vendor preparations
2. Replacement of the following items as necessary:
 - Ribbons
 - Print bands
 - Plastic ribbon shields
 - Vacuum bags

All of the above replacement items except vacuum bags can be purchased through country Systems Supplies Office. Vacuum bags will be supplied at no charge by Customer Engineering for IBM-maintained machines. See the "Supplies" section for further information. If the customer desires to have Customer Engineering replace or install any of these items, the CE time involved will be billed to the customer.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Power (AC, 3-phase): Specify according to customer's power source.

50 Hz	60 Hz
200V #2807*	200V #2733*
220V #2815*	208V #9903*
380V #2816**	220V #2800*

400V #2825** 240V #9915*
415V #2826** 380V #2824**

* Delta connected

** Y connected

- Machine Nomenclature: One must be specified. Field Installation: Not recommended.

Brazilian #2933 US English #2924
Canadian Japanese #2930
Bilingual #2935 Spanish #2931
UK English #2927

- Color: Machine is available in Pearl White only.
- Specify feature #9160 on Model D12 or D20 for attachment to 4361 Processor Workstation Adapter. See M4361 for prerequisites.
- Print Band Character Set: Select one band only by specifying one number from Groups A, B, and C. Please note some cases where selections from Group B or C are not required. When printing eight lines per inch, 2.0mm (0.079 in.) character height is recommended. One print band will be shipped at no charge with the printer. Replacement or additional print bands may be obtained by the customer for a charge. See "Supplies" section. Special (RPQ) print bands may be required. Please review printing requirements prior to placing the order.

Group A:

- #9520 48-Character EBCDIC
- #9530 48-Character OCR-AON (1) (4)
- #9534 48-Character OCR-BOA (1) (6)
- #9630 48-Character OCR-AON (mdl 20/D20/T20 only) (1) (5)
- #9634 48-Character OCR-BOA (mdl 20/D20/T20 only) (1) (5)
- #9521 50-Character Scientific
- #9526 52-Character FORTRAN/COBOL (2)
- RPQ S01090 60-Character S/38 Special (1) (2)
- #9524 63-Character ASCII (2)
- #9522 63-Character EBCDIC
- #9525 94-Character Commercial (1)
- #2985 84-Character Korean Hangul-Type A (1) (2)
- #2976 84-Character Korean Hangul-Type B (1) (2)
- #9537 98-Character ASCII (1) (2)
- #2872 108-Character Japan Katakana
- #2779 116-Character Canadian French
- #9527 124-Character Scientific (1)
- #2873 127-Character Japan Katakana
- #2785 127-Character Katakana/OCR (Model 12 only)
- #2808 127-Character Katakana/OCR (Model 20 only)
- #2781 142-Character Canadian-Bilingual (1) (2)

Group B:

#2950 International
#2975 Brazil
#2977 Canadian French
#2955 Japan/English
#2973 Japanese Katakana (3)
#2961 Spanish Speaking
#2958 UK English
#2956 US English

Group C:

#9950 2.4mm (0.095 in.)
#9951 2.0mm (0.079 in.)

Notes:

1. Available only with the 2.4mm (0.095 in.) character height. No selection from Group C is required.
2. A selection from Group B is not required.
3. Japanese Katakana available only for 108 (#2872) and 127 (#2873) (Mdl 1 only), RPQ S00704 (Mdl 12 only), RPQ S00706 (Mdl 20 only), RPQ S00714 character sets.

4. Available only with language selection (See Group B) #2956, #2958, #2961.
5. Available only with language selection (see Group B) #2956.
6. Available only with language selection (see Group B) #2956, #2958. If using multiple bands of different languages for this character set, the customer must ensure the correct band (language) is installed on the printer, since the print band verification done by the printer will not distinguish among different languages for this character set.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS

Upgrades may be made in the field from a Model 12 to a Model 20, from a Model D12 to a Model D20, or from a Model T12 to a Model T20. 4245 D12/D20 without specify feature #9160 may be changed in the field to a D12/D20 with specify feature #9160 and vice versa. Conversions cannot be made from a Model 12 to a Model D12 or a Model 20 to a Model D20. All conversions require MES orders.

ACCESSORIES

See "Customer Responsibilities" under "Highlights".

SUPPLIES

Ribbons

- P/N 7034437 (No Longer Available) or equivalent is required for all non-OCR printing applications.
- P/N 6204923, or equivalent is required for OCR printing applications.

Print Bands: Replacement or additional bands are available. See the 4245 Print Band manual (GA33-1584) for print band P/Ns.

Plastic Ribbon Shields: P/N 6092766, or equivalent is required.

For all of the above supplies, ordering information and prices may be obtained through country Systems Supplies Office.

4248 IMPACT LINE PRINTER

PURPOSE

The 4248-002 Printer is a new addition to the IBM family of high speed impact printers. Using a new hammer magnet technology and an etched steel print band, the 4248-002 achieves print quality at 4000 lpm which approaches that of the 4248-1 at 3000 lpm and print density on multipart forms equivalent to that of the 3211. Ergonomic enhancements facilitate operator setup and utilization, such as elimination of platen wear strips and the ability to store up to 20 job setups for instant recall. OCR capability is a standard feature at 2200 lpm. The enhanced print quality, superior performance and function, and reliability make this machine an excellent growth path for 3211, 4245, 3203 and 1403 customers. It also provides an offering for non-IBM users to consider new levels of performance and reliability. The 4248-002 attaches via a channel to 43XX, 303X, 308X, 3090 and 9370 processors.

MODELS

Model 001 (No Longer Available)

Model 002

Limitations: Although the 4248-002 has selectable speeds of 2200, 3200 and 4000 lpm, actual performance will vary depending on the printband, spacing, skipping and actual data to be printed. Attachment to a byte multiplex channel is not recommended due to the potential for degradation in performance. See the throughput calculation section of the "4248-002 Printer Description", GA24-3991.

When operating in 3211 mode, the following 4248 features are not available:

- Host-controlled speed selection
- Host-controlled intermixing of vertical spacing
- Automatic print band verification
- Horizontal Copy
- Optional print positions (above 150)

The 4248 is a multi-speed printer that offers significantly higher levels of speed and function in impact printers. It allows the user to select the speed that provides the level of print quality needed for each application.

Customer Setup: The 4248-002 is not designed as a Customer Setup (CSU) machine.

DESCRIPTION

- Program or Operator Selectable Speeds - Print speeds are selectable in three options; 2200, 3200, and 4000 lpm. This allows the operator to select the best speed for an application. In 3211 mode speed, selection is always from the operator panel. In 4248 mode, speed is selected by Forms Control Buffer information or from the operator panel.
- OCR Capability Standard at 2200 lpm - The proper print band, ribbon, and paper are all that are required to obtain OCR-A or OCR-B numeric printing that is machine readable.
- Recall Job Setup - The Operator can set up and store up to twenty different print jobs for recall at any time. This includes basic operator job set up controls: Print Density, Hammer Adjust, Speed, Stacker Mode.
- Two Modes of Operation are Available - In 3211 mode with 3211 Printer application programs, or in 4248 mode, the printer runs at approximate 4248-002 rated speeds. In 4248 mode all the advanced 4248-002 functions are supported.
- 168 Print Positions are Available - 132 Positions are standard. Horizontal Copy at 168 print positions allows the user to print two original documents (up to 80 columns wide) of the same

information on a single form side by side. See feature code #3751 or #3753.

- Advanced, Fully-Enclosed Power Stacker - The power stacker has one mechanical operator adjustment for the length of the form. After approximately 17 inches of form have accumulated in the stacker, the operator slides the stacker tray out and removes the form. Difficulty in stacking some forms, such as card stock, can be avoided through the use of another 4248 capability that allows the operator to control the stacker tray height from the operator panel.
- High Level of Reliability - The reliability of the 4248-002 is demonstrated by the one-year warranty, the absence of any required preventive maintenance and the attractive MMMC. Optimum print quality can be maintained by the customer by running the hammer flight time routine.
- Enhanced Print Quality - Print Quality is enhanced over the 4248-001. A new platen and hammer magnet technology increases the hammer energy and slows the printband velocity while printing at high speed. Multipart capability has been increased to 6-part at low and medium speeds and four part at high speed. Overall Print Density is improved at all speeds.
- Wide Range of Program Support Available - The printer is supported in both 4248 and 3211 modes by VSE, VM/SP, VM/XA, and MVS. See the Software Requirements section for specifics.

Print Quality General Recommendations

Low Speed (2200 lpm)

- Print Quality: Equivalent or superior to that of the 3211 or 3203.
- Application: Preferred for best quality printing.
- Part Forms: 1-6*

OCR Printing (2200 lpm)

- Print Quality: OCR Readable.
- Application: Required for OCR Applications.
- Part Form: 1**

Medium Speed (3200 lpm)

- Print Quality: Less than at low speed but generally comparable to that of the 3211 and 3203.
- Application: Recommended for most applications except OCR.
- Part Forms: 1-6*

High Speed (4,000 lpm)

- Print Quality: Less than medium speed but approaching the print quality of the 4248-001 at medium speed.
- Application: Customers should assess on an individual application basis to ensure print quality will meet end user requirements.
- Part Forms: 1-4*

* Multipart forms over 4-part and special forms, including those used on other printers, should be tested on the 4248-002 for acceptance.

** OCR paper, ribbon, and printband requirements are necessary. These have not changed with use of the new model.

The 4248 is capable of multiply printing up to 6-part forms. However, the following general limitations must be observed:

- Maximum form set thickness of 0.51mm (0.020 in.).
- Four-part maximum at high (4,000 lpm) speed.
- Forms sets of more than 4-parts should be tested for acceptable print quality of the copies.
- Single-part forms are recommended for OCR.

See "Forms Design Reference Guide for Printers", GA24-3488, for details.

HIGHLIGHTS

- Enhanced print quality at high speed and improved multipart form capability over 4248-001.
- Recall Job Setup capability of up to 20 jobs through the operator panel.
- Program or operator selectable speeds of 2200, 3200 and 4000 lpm and OCR capability standard at 2200 lpm.
- A new platen that eliminates the need for platen wear strips.
- High level of reliability.
- 132 print positions are standard; 168 are available.
- Advanced, fully enclosed power stacker.

Maintenance: Maintenance is available 24 hours/day, 7 days/week. Maintenance exclusions - consumables including:

Print Band
Ribbons
Forms Retention Belts
Ribbon Shield
Vacuum Cleaner Bags

When an error occurs, the customer will be asked to follow CPAR procedures, run diagnostic tests and, in some cases, replace consumables prior to calling for service.

Physical Specifications

Width - 1525mm (60 inches)
Depth - 1220mm (48 inches)
Height - 1,350mm (53 inches)*
Weight - 865kg (393 pounds), including stacker
Weight - 725kg (330 pounds), without stacker

* Attention light is 70mm (3 in) additional.

Operating Environment

Temperature - 16 to 32 degrees C (61 to 90 degrees F)
Relative Humidity - 8 to 80 percent
Wet Bulb Maximum - 23 degrees C (73 degrees F)

PROGRAMMING SUPPORT

Software Requirements

4248 Mode

Operating System	Minimum Release Level
VSE	VSE/SP 2.1.3 native mode VSE/SP 3.1.1 full support
VM/SP	3.0
VM/SP HPO	3.6
MVS/370	MVS/SP 1.3.4 and MVS/370 DFP 1.1 MVS/SP-JES2 1.3.4 MVS/SP-JES3 1.3.4

COMPATIBILITY

The 4248-002 will accept all 3211 commands when operating as a 3211. However, certain features of the 4248 are not available in 3211 mode. They are:

- Host controlled speed selection
- Host controlled inter-mixing of vertical spacing within a page
- Automatic Print Band Verification
- Horizontal Copy
- Optional Print Positions (above 150)

See "4248-002 Printer Description", GA24-3991, for details.

SPECIFY

- The country standard voltage, power cord, nomenclature, and language will be supplied based upon the country code of order. Use the specify codes below only when an alternative to the country default is required.

60 Hz
208V #2733
240V #2802

- Machine Nomenclature: Field change or installation is not recommended.

Operator Panel	Safety Labels
#2934 US English	Brazilian
#2935 French	Fr/Fr Canadian
#2924 US English	US English
#2927 US English	UK English

- Japanese English #2955
- Japanese Katakana** #2973
- Spanish Speaking #2961
- UK English #2958
- US English #2956

** Available only in 108 (#2780) and 127 (#2873, #2785) character sets.

TABLE C - Character Set Height

- #9555* 2.7mm (0.105 in.)
- #9950 2.4mm (0.095 in.)
- #9951 2.0mm (0.079 in.)

* 3211 Style

ACCESSORIES

Printbands: Select character set, language where necessary, and height from Tables A, B, and C. All must be specified on the order. One of the selected print bands will be provided free of charge with the 4248-002. Replacement and/or additional print bands are the customer's responsibility, and should be ordered through IBM Direct. If the customer desires to have Customer Engineering install the print band or other consumables, time involved will be billed to the customer.

Special (RPQ) print bands are available on the initial machine order. With a special printband, the machine order will be scheduled to allow time for estimation, design, and tooling of the printband. Please review printing requirements with your customer prior to placing the order.

TABLE A

- #9520 48-character set: EBCDIC

1. Available only in 2.4mm (0.095 in.) character height.
2. Available only with US English.
3. Available only in 2.7mm (0.105 in.) character height.

TABLE B

- Brazil #2975
- French Canadian #2977

SUPPLIES

None required with machine order. A "Starter Pac" is available from your Country DP Supplies Coordinator and should be considered for the first 4248 installed in an account. See the Supplies Coordinator for details on the "Starter Pac" and other supplies.

The customer is responsible for the following consumables:

Print Band
Ribbons
Ribbon Shield
Forms Retention Belt
Vacuum Cleaner Bag

Consumables available from IBM are:

Item	Estimated Life
Printband	80,000,000 Lines*
Ribbon-High Contrast	1,200,000 Lines*
Ribbon-Long Life	2,000,000 Lines*
Ribbon-OCR	180,000 Lines*
Ribbon-Polyester	180,000 Lines*
Ribbon-Shield	10,000,000 Lines
Forms Retention Belt	10,000,000 Lines
Vacuum Cleaner Bag	15,000,000 Lines

* Estimated life derived from IBM testing at 2,200 lpm for the OCR and High Contrast ribbons and 3,200 lpm using 0.105-inch high font for the others.

Printband and ribbon life experienced by a user varies significantly depending on printer condition, machine setting, paper quality, print band condition, font height, high use of small area characters and other factors.

If the customer desires Customer Engineering to replace or install any of these items, the time involved will be billed to the customer.

4250 PRINTER

I THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

The 4250 is a high-resolution non-impact printer. It is all-points-addressable (APA) with an addressing resolution of 600 dots per inch in both horizontal and vertical direction and can print a wide variety of text in various styles and sizes, graphics objects with various complexity. As an all-points-addressable device the 4250 can print host system-supplied dot patterns. The 4250, together with associated software such as Document Composition Facility (DCF) Release 3 and Graphical Data Display Manager (GDDM) Release 3, provide a new level of print quality, function, and ease-of-use for a variety of customer applications such as documentation, production of manuals, brochures, reports, newsletters, presentations, etc. Based on electro-erosion technology, the 4250 produces type-set quality camera-ready master-pages directly from an IBM host computer system without photo-sensitive processes and costly darkroom facilities. Unlike traditional photo typesetters, the 4250 output is dry and immediately visible and usable. The output can be reproduced by using the conventional reproduction methods used in the reproduction industry. If the output is reproduced via copiers, the customer should evaluate the results of the copying process on the specific copier.

MODEL 1

Model 1 001

Limitations: A blackness ratio of 50% per page should not be exceeded. In case of simulated halftones customers should evaluate these against their application requirements.

Prerequisites:

3274 Mdl 1A Attachment:

- #9112 Configuration Support C at release level 46 or higher.
- Enough control storage to customize for SCS printer support (SCS), structured field and Attribute processing (SFAP) and one extended attribute terminal (EAT) for each 4250 attached.

3274 Mdl 1D Attachment:

- #9112 Configuration Support C at release level 46 or higher.
- Enough storage to customize for SFAP and one EAT for each 4250 attached.

3274 Mdl 31A or 31D Attachment:

- #9112 Configuration Support C level 46 or higher. Storage features are not required, but enough control storage must be available to customize for SFAP. SCS support is required for the 31A.

or

- #9124 Configuration Support D, and #3650 Extended Function Store Type C1, and #3101 Integrated Diskette Drive Enhancement.

3274 Mdl 41A or 41D Attachment: No features or special considerations required.

4331 Mdl 1, 2, or 11 Attachment: Specify code #9260 for DPA.

Customer Setup (CSU): The 4250 is a Customer Setup (CSU) machine, thereby offering the customer early availability and relocation flexibility. Setup procedures are shipped with each machine. The Customer Setup allowance is four days for each 4250 (regardless of quantity) starting from the day of the arrival at the customer's

shipping dock. For additional information on CSU, refer to the GI section.

HIGHLIGHTS

- Provides high-quality (typeset-level) master pages at an addressing resolution of 600 dots per inch in horizontal and vertical direction.
- Provides immediately usable dry output and requires no chemical processes with costly darkroom facilities or special environmental considerations.
- Provides the capability of printing and merging of a wide variety of text, graphics and host generated dot patterns.
- The output of the 4250 is immediately visible.
- Uses aluminum-coated paper which is inexpensive compared to conventional photographic paper.
- Provides end-user convenience, small size, and silent operation suitable for an office environment.
- The output is easily reproducible and of archival quality.

System Attachment: The 4250 attaches to the 3174 Subsystem Control Unit mdls 1R, 2R, and 3R (which require RPQ #7B0980) and to the 3274 Control Unit, mdls 1A, 1D, 31A, 31D, 41A and 41D. Using these Control Units, the 4250 can be attached to any S/370 mdl 138 and up or 43XX and 30XX. In addition, the 4250 attaches directly to the 4331 and 4361 via the Integrated Display/Printer Adapter and the 4361 Workstation Adapter and to the 9370 via a Workstation Subsystem Controller.

Human Factors: The 4250 uses electro-erosion printing technology resulting in a quiet operating unit suitable for installation in an end-user environment. In conjunction with the programming support, the user can initiate re-transmission of a page, if for example, the paper roll is empty prior to reaching the end of the page. The output of the 4250 is immediately visible and no chemicals are involved in obtaining the high quality, camera-ready master-page.

Problem Determination Procedures: The microcode checks and monitors the status of the printer and provides status information on the two-digit display in case of malfunction. The Reference Card (GX33-1504) in the rear of the machine provides the problem determination steps. At initial power-on, an automatic sequence of tests checks the circuitry and measures the width of paper mounted in the machine. A subset of these tests is conducted whenever the reset key is depressed. Offline tests may be initiated via the Operator Control Keys to check the function of the electrode driver circuitry.

Indicator Lights: The 4250 has six function-indicators and a 2-digit display which provide status and error code information. A power indicator light is also provided.

Operator Control Keys: The keyboard contains 16 keys. Those of prime importance to the operator such as Start, Stop, Paper Advance, and Reset, are brightly colored for positive recognition. The remaining keys, for application interface and problem determination, are used primarily by the CE.

Performance Considerations: The 4250 is an all-points-addressable printer and performance measures such as lines per minute or characters per second are not meaningful. The physical speed of the print head is one meter per second (approximately 40 inches per second). The actual time to print one page is dependent upon:

- Complexity and size of the page.
- Content of a page, e.g., number of skips, line length, etc.

For planning purposes, the printing time for an average A4 size page ranges between 1.5 and 2.5 minutes provided the 4250 operates at maximum printing speed.

IBM Aids: The FIVE/3270 configurator will be enhanced to provide support for 4250 attached to the 3274 control unit.

Customer Responsibilities: The customer is responsible for:

1. Adequate site, system, and other vendor preparation.
2. Receipt at the customer's receiving dock, unpacking and placement of the 4250 at initial setup.
3. Physical setup, connections of cables in customers access areas and check-out.
4. Contacting IBM Customer Engineering to make cable connections of IBM CSU units to non-CSU units where customer access areas are not provided.
5. Procurement, installation, and maintenance of cables. See "Accessories".
6. Disconnection and removal to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.

Shipping Materials: All shipments are from the plant of manufacture. Packaging material need not to be returned.

Programming Support:

System Support: The 4250 is supported for operation under the following operating systems:

- VM/CMS -- The 4250 is running under VM/SP Release 1 and 2 specifying the 4250 as an unsupported device. VM/SP Release 3 provides standard support as a dedicated device.
- VSE/Advanced Functions -- VSE/Advanced Function Release 3 with either ACF/VTAM Release 3 or ACF/VTAM Version 2 or ACF/VTAME.
- MVS/370 (MVS/SP Version 1 Release 3 or later). ACF/VTAM Release 3 or ACF/VTAM Version 2.
- MVS/XA (MVS/SP Version 2 Release 1 or later). ACF/VTAM Release 3 or ACF/VTAM Version 2.

Application Support: The 4250 will be supported by the following strategic IBM Application Packages:

- Document Composition Facility Release 3 (5748-XX9).
- Document Library Facility Release 3.
- Graphical Data Display Manager Release 3 (5748-XXH) on MVS/TSO and VM/SP CMS only.
- Composed Document Printing Facility (CDPF).
- IBM Typographic Fonts for the IBM 4250.

Basic Configuration: The basic machine is shipped with a non-locking power cable plug and a 4.3m (14 ft) power cable. See "Specify".

Publications:

- "Planning and Site Preparation Guide" (GA33-1552)
- "Component Description and Programming Information Manual" (GA33-1554)
- "Operator's Guide" (GA33-1551)
- "Customer Setup Instructions" (GA33-1553)
- "Reference Card" (GX33-1504)
- "Trouble Report Form" (GX33-1503)
- "IBM 4250 Printer: Type Styles Portfolio" (G520-0004)

SPECIFY

- Voltage (AC, 1-phase, 3-wire): Nonlocking plug.

50 Hz	60 Hz
100V #2804	100V #2730
200V #2806	120V #9911
220V #2813	200V #2732

	240V #2831
- Power Cable Length: #9511 for 1.8m (6 ft).
- Color: Pearl White is the only available color. No specify required.
- Communication Cable: Communication cable is not shipped with the machine. The customer is responsible for procurement, installation, and maintenance of cable. See "Accessories".
- Installation Documentation: The default language for the installation documentation is English, for other languages specify:

Canadian French	#2935
Japanese	#2930

SPECIAL FEATURES

4250 Print Adapter (#3930, P/N 6193065): Provides the capability to communicate with a 4250 II ElectroCompositor or a 4250 Printer Model 001 from a Personal Computer over a standard IBM 3270 coaxial communications link. The card supports the emulation of an IBM 3274D cluster controller in driving the printer. The card is designed to be used with the an IBM PC AT (5170), PC XT (5162 Model 286), or Personal System/2 Model 30 (8530-021).

The sole purpose of the card is to handle the link level operation of the communication interface which includes all response time-sensitive commands. No data transferred from the PC to the 4250 will be interpreted by the adapter card. The 4250 Print Driver will correctly format the data for the 4250.

The card will provide a "backchannel" for the 4250 in that the printer status can be obtained and passed back to the PC by request.

The interface between the PC and the card consists of a set of shared registers, a protocol for using these registers, and the capability of the card to send an interrupt to the PC. The PC has the option of interacting with the card under CPU control or through the DMA channel.

Through the use of the 4250 Print Adapter, composed pages created on a host processor using Document Composition Facility may be printed on a 4250 attached to a PC. The PC may be attached to the host, either locally or remotely. In addition, in a stand-alone environment, documents created by PC page composition software packages which support the 4250 can be printed.

Prerequisites: DOS 3.1 or higher and 4250 Print Driver and at least one Typographic Font. Customer Setup (CSU): Yes.

Highlights:

- Full size PC card.
- Supports 4250 in a self-contained publishing environment.
- Provides the capability of outputting merged text, graphics, and image to a PC-driven 4250.

Physical Specifications: Full size card.

Operating Environment:

Temperature: 15.6 to 32.2 degrees C (60 to 90 degrees F)
Relative Humidity: 8 to 80 percent

MODEL CONVERSIONS (NONE)

ACCESSORIES

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

Twisted-Pair Cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361). For pricing

and ordering information, refer to the System Supplies operation within your country.

Coaxial cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning" (GA27-2787) and "Coaxial Cable and Accessories Manual" (GA27-2805).

SUPPLIES

Electro-erosion paper is available from your Country DP Supplies Coordinator. The paper is on rolls and supplied in cartons (10 rolls per carton). Four widths are available:

210mm x 100m (8.26 inches x 300 feet); P/N 7034360
215.9mm x 100m (8.5 inches x 300 feet); P/N 7034361
265mm x 100m (10.43 inches x 300 feet); P/N 7034362
330mm x 100m (12.99 inches x 300 feet); P/N 7034363

The electro-erosion paper is a sensitive part of the machine. Use of paper that does not meet IBM specifications may result in unsatisfactory print quality or damage to the print head.

4250 II ELECTROCOMPOSITOR MODEL 002
PURPOSE

The 4250 II ElectroCompositor Model 002 is a high resolution, non-impact printer capable of outputting a specially formulated pre-plate negative (electroNEG) or camera-ready masters. It is all points addressable (APA) with an addressing resolution of 600 x 600 dots (pels) per square inch. It can print a wide variety of text, image, and graphics in various type styles and sizes in an office or publications environment.

MODELS
Model 002

Limitations: The printhead and print medium form a functional unit of the 4250 II ElectroCompositor. Using material that does not meet the specifications may cause unsatisfactory print quality and may damage the printhead.

When reproducing the 4250 II camera-ready master using a copier, it may be necessary to try different settings for copy density or different types of copiers to obtain optimum results.

A blackness ratio of 50% per page should not be exceeded. In case of simulated halftones, customers should evaluate these against their application requirements.

If electroNEG is to be archived, special handling and storage conditions are necessary. The material is susceptible to oxidation resulting in reduced optical density in areas where it has been handled and exposed to high humidity. To prevent this problem, it is recommended that handling be limited to non-image areas and the material stored in a cool, dry environment.

Prerequisites:

- If 4250 II is to be host attached, Composed Document Printing Facility PTF #PL07220 must be ordered.

- 3274 Model 1A

Configuration Support C (#9112) at Release Level 46 or higher. Enough control storage to customize for SCS printer support, Structured Field and Attribute Processing (SFAP) and one Extended Attribute Terminal (EAT) for each 4250 attached.

- 3274 Model 1D

Configuration Support C (#9112) at Release Level 46 or higher. Enough control storage to customize for SFAP and one EAT for each 4250 attached.

- 3274 Models 31A and 31D

Configuration Support C (#9112) at Release Level 46 or higher. Storage features are not required, but enough control storage must be available to customize for SFAP. SCS support is required on Model 31A.

OR: Configuration Support D (#9124), EFS Type C1 (#3650) and Integrated Diskette Drive Enhancement (#3101).

- 3274 Models 41A and 41D

No features or special considerations required.

- 3274 Model 31C

Configuration Support C (#9112) at Release level 48 or higher, and #6303 High Performance Communication Adapter (SNA/SDLC only). Storage features are not re-

quired, but enough control storage must be available to customize for SFAP and SCS support.

Or, Configuration Support D (#9124) at Release Level 63 or higher, #3650 Extended Function Store Type C1, #3101 Integrated Diskette Drive Enhancement, and #6303 High Performance Communication Adapter (SNA/SDLC only).

- 3274 Model 51C

Configuration Support C (#9112) at Release Level 48 or higher, (#1800 Extended Function Store (EFS) Type D4) or #1802 Control Storage Expansion (CSE) plus #3632 EFS Type D2 or #1802 CSE plus #3630 EFS Type D1 plus #3631 EFS Type D3, and #6303 High Performance Communication Adapter (SNA/SDLC only). Enough control storage must be available to customize for SFAP and SCS support.

Or, Configuration Support D (#9124) at Release Level 63 or higher, (#1800 Extended Function Store (EFS) Type D4) or #1802 Control Storage Expansion (CSE) plus #3632 EFS Type D2 or #1802 CSE plus #3630 EFS Type D1 plus #3631 EFS Type D3, #3650 EFS Type C1, #5101 Integrated Diskette Drive Enhancement, and #6303 High Performance Communication Adapter (SNA/SDLC only).

- 3274 Model 41C, 61C

Configuration Support D (#9124) at Release Level 63 or higher, and #6303 High Performance Communication Adapter (SNA/SDLC only).

- 3274 Models 31C, 41C, 51C and 61C - 3174 Models 1R, 2R, 3R, 51R, 52R, 53R, 81R, and 82R.

Requires 4250 RPQ #7B0980.

- 4321, 4331

4250 Attachment (#9260) on the Display/Printer Adapter.

- 5162, 5170, IBM Personal System/2 8530-021

Requires PC Attachment Card (#3930) and 4250 Print Driver (#0961).

Customer Setup (CSU): Yes.

HIGHLIGHTS

- Provides high quality pre-plate negatives (electroNEG) or camera-ready master pages at an addressing resolution of 600 x 600 dots (pels) per square inch.
- Provides immediately usable dry output and requires no chemical processes, darkroom facilities, or special environmental considerations.
- Provides the capability of printing text merged with graphics and image.
- Output is immediately visible and usable.
- Through the use of electroNEG, the costly photographic process of negative creation is eliminated.
- If desired, camera-ready master paper which is less costly than conventional photographic materials may be used.
- Provides new take-up mechanism for convenient multi-page output handling.
- Provides end-user convenience - small size and quiet operation suitable for an office environment.

DESCRIPTION

The output of the 4250 II ElectroCompositor is normally used as a high quality pre-plate negative for reproduction by a printing press. Its output is dry, immediately visible and usable, and does not require chemical processing as do traditional photographic techniques. For those jobs requiring camera-ready masters or for use as a proofing device, the 4250 II can output paper masters rather than electroNEG.

The 4250 II uses advanced electro-erosion technology. During printing, an electric current passes through high-precision guides with electrode tips onto aluminized polyester or paper. These tips create a high current density that heats and eliminates the aluminum layer. This results in a transparent area on electroNEG or a contrasting area on the paper. ElectroNEG can then be used directly to make a printing plate or the paper can be used as a camera-ready master.

Unlike traditional photographic technology, this process requires no special chemicals or facilities and is exceptionally clean, dry, and easy to use.

The 4250 II, with associated software such as the Document Composition Facility, Graphical Data Display Manager, Publishing Services Executive, Publishing Systems BookMaster, and the Publishing Graphics Facility, covers a wide spectrum of application areas. Output from the 4250 II is generally used in the production of manuals, procedures, price lists, forms, brochures, etc.

The 4250 II has been designed for ease of use. It offers a number of operator control keys and indicator lights. Also, with the programming support, the user can initiate retransmission of a page if necessary.

Currently installed 4250 Printer Model 001s can be field upgraded to the 4250 II ElectroCompositor.

Physical Specifications:

Width: 750mm (29.5 in.)
Depth: 500mm (19.7 in.)
Height: 1,000mm (39.4 in.)
Weight: 120kg (260 lbs.)

Operating Environment:

Temperature: 15.6 to 32.2 degrees C (60 to 90 degrees F)
Relative Humidity: 8 to 80 percent
Wet Bulb: 23.0 degrees C (73 degrees F)

Publications: The following publications are shipped with the product.

- GA66-0612 Operator's Guide
- GA66-0610 Introduction and Planning Guide
- GA66-0611 Customer Set-Up Instructions
- GA66-0614 Reference Information For Operators

Additional copies will be available.

The following publications will be available. To order, contact your IBM representative.

- GX66-0300 4250 II electroNEG Reference Information for Printers

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60Hz, non-locking plug): #9885 for 208V, or #9895 for 240V.
- Power Cable Plug: #9080 for watertight plug (where required for under raised floor connection) in lieu of non-locking plug.
- Power Cable Length: #9986 for 1.8m (6 ft.)

SPECIAL FEATURES

4250 Print Adapter (#3930, P/N 6193065): Provides the capability to communicate with a 4250 II ElectroCompositor or a 4250 Printer Model 001 from a Personal Computer over a standard IBM 3270 coaxial communications link. The card supports the emulation of an IBM 3274D cluster controller in driving the printer. The card is designed to be used with the an IBM PC AT (5170), PC XT (5162 Model 286), or Personal System/2 Model 30 (8530-021).

The sole purpose of the card is to handle the link level operation of the communication interface which includes all response time-sensitive commands. No data transferred from the PC to the 4250 will be interpreted by the adapter card. The 4250 Print Driver will correctly format the data for the 4250.

The card will provide a "backchannel" for the 4250 in that the printer status can be obtained and passed back to the PC by request.

The interface between the PC and the card consists of a set of shared registers, a protocol for using these registers, and the capability of the card to send an interrupt to the PC. The PC has the option of interacting with the card under CPU control or through the DMA channel.

Through the use of the 4250 Print Adapter, composed pages created on a host processor using Document Composition Facility may be printed on a 4250 attached to a PC. The PC may be attached to the host, either locally or remotely. In addition, in a stand-alone environment, documents created by PC page composition software packages which support the 4250 can be printed.

Prerequisites: DOS 3.1 or higher and 4250 Print Driver and at least one Typographic Font. Customer Setup (CSU): Yes.

Highlights:

- Full size PC card.
- Supports 4250 in a self-contained publishing environment.
- Provides the capability of outputting merged text, graphics, and image to a PC-driven 4250.

Physical Specifications: Full size card.

Operating Environment:

Temperature: 15.6 to 32.2 degrees C (60 to 90 degrees F)
Relative Humidity: 8 to 80 percent
Wet Bulb: 23.0 degrees C (73 degrees F)

Publications: The following publication is shipped with the product: P/N 6193073 Guide To Operations

MODEL CONVERSIONS

Model 001 may be field converted to Model 002.

Composed Document Printing Facility (PTF #PL07220) is required to support the Model 002.

MACHINES

ACCESSORIES (NONE)

SUPPLIES

The 4250 II ElectroCompositor can accommodate electroNEG, a specially formulated pre-plate negative, or an electro-erosion paper. Both are available from National Distribution Division Systems Supplies using general National Distribution Division Systems Supplies ordering procedures. Outside the U.S., both are available from IBM Direct.

ElectroNEG is on rolls and is supplied in cartons of 4 rolls each in the following widths (minimum order quantity - 1 carton):

- P/N 6330578 258.0mm x 50m (10.16 inches x 164 feet) roll
- P/N 6330579 330.0mm x 50m (12.99 inches x 164 feet) roll

Yield is approximately 150 negatives per roll.

IBM warrants electroNEG to be free from defects in materials and workmanship at the time of purchase. IBM's entire liability is to replace or exchange the product within 12 months from date of purchase.

Electro-erosion paper is on rolls and is supplied in cartons of 10 rolls each in the following widths (minimum order quantity - 2 cartons):

- P/N 7034360 210.0mm x 100m (8.26 inches x 328 feet) roll
- P/N 7034361 215.9mm x 100m (8.50 inches x 328 feet) roll
- P/N 7034362 265.0mm x 100m (10.43 inches x 328 feet) roll
- P/N 7034363 330.0mm x 100m (12.99 inches x 328 feet) roll

Approximate yield - 300 masters per roll.

Note: ElectroNEG and the electro-erosion paper are a sensitive part of the machine. Use of material that does not meet IBM specifications may result in unsatisfactory print quality or damage to the printhead.

4321 PROCESSOR

(NO LONGER AVAILABLE)

* MODEL UPGRADES FROM 4321 TO 4331 and 4361 ARE NO LONGER AVAILABLE.

Although the 4321 is no longer available, features, released RPQs, and accessories are not affected. No new RPQs will be accepted.

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the arithmetic, logic and processor storage functions of the 4321 Processor.

MODELS

Model J11: 1,048,576 (bytes) Processor Storage

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console model 2A or a 3279 Color Display Console model 2C with keyboard and control panel is required for this purpose.

Maximum Configuration: The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to "IBM 4321, 4331 Processor Channel Characteristics, GA33-1527", or use the HONE aid ANCHLOAD.

HIGHLIGHTS

The 4321 is a featured processor with one megabyte of processor storage and contains the following standard hardware features:

Equivalent feature number on 4331 MG1

128K bytes of control storage	#1901
One DASD adapter base	#3201
One 8809 adapter	#4910
Display/Printer Adapter Expansion (16 ports)	#2001
Communication Adapter Base	#1601
ECPS VM/370 (VM assist microcode)	#8701

These features are not ordered separately. Features and their specify codes not standard on the 4321 must be ordered individually for the 4321.

The processor contains 1,048,576 bytes of monolithic processor storage. Data flow is four bytes parallel. Storage fetch cycle is 900 nanoseconds for four bytes and the store cycle is 1,300 nanoseconds for four bytes. The processor is microcode controlled.

Note: The microcode which controls system operations resides in Processor Storage and Reloadable Control Storage. 4321 includes 131,072 bytes of Control Storage. In addition to the microcode contained in this storage, a minimum of 136,000 bytes of Processor Storage are occupied by microcode, RAS workspace and system data for the featured 4321 Processor.

Standard Functions:

- Processor storage -- 1,048,576 bytes. The 4321 Processor configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 below for details.

- ECPS/VSE Mode or S/370 Mode: The 4321 operates in either S/370 Mode or in ECPS/VSE mode. The system mode is selectable at Initial Program Load (IPL) time. S/370 mode is required for operation with VM/SP, ECPS/VSE mode for operation with SSX/VSE and DOS/VSE Release 3.

- Display/Printer Adapter allows attachment of:

- 3178 Display Station
- 3179 Color Display Station (base color)
- 3180 Model 1 Display Station
- 3262 Line Printer Model 1 (650 lpm system printer)
- 3262 Line Printer Model 11 (325 lpm system printer)
- 3268 Printer Model 2 and 2C (340 cps)
- 3289 Line Printer Model 4 (400 lpm system printer)
- 3278 Display Station Model 2, and keyboards
- 3279 Color Display Station Model 2A and keyboards
- 3278 Display Console Model 2A, keyboard and control panel
- 3279 Color Display Console Model 2C, keyboard and control panel
- 3287 Printer Models 1, 2, 1C and 2C.
- 4224 Printer Models 2XX (200/400 cps) (Non-IPDS Mode)
- 4234 Model 1 Dot Band Printer
- 4250 Printer
- 5210 printer Models G01, G02
- 6580 Displaywriter System Model A4, A6 A8, A10 (25-line display)

Note: SSX/VSE supports the 3279 Color Display Console Model 2C as a 3278-2A with no specific color support, i.e. color is determined via the default attribute byte only.

- The System Diskette Facility is the microcode loading system for the 4321 Processor. The diskettes shipped with the 4321 Processor will supply the required microcode including diagnostics. The System Diskette Facility also allows storage of failure data from 4321 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.
- Reloadable Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode of the 4321 Processor. The Reloadable Control Storage is not available to the user. 4321 includes 131,072 bytes of Reloadable Control Storage.
- Remote Support Facility (RSF) is an IBM CE tool permitting IBM specialists to remotely monitor and/or perform problem diagnosis on the 4321 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization), remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML/IPL and execute manual control functions on a remote 4321 via a 3275 (real or emulated) terminal at a host location. ROCF is an extension of the Remote Support Facility (RSF) and may be ordered as a no-charge specify feature.
- One Level addressing facility for improved virtual storage control by DOS/VSE and SSX/VSE (ECPS/VSE mode)
- Channels with virtual storage addressing (ECPS/VSE mode)
- Channel Indirect Data Addressing (in S/370 Mode)

Other Standard Functions are:

- Virtual Storage capability by Dynamic Address Translation
- Control by VSE (ECPS/VSE mode)
- S/370 Universal Instruction Set
- Extended Precision Floating Point
- Conditional Swapping
- CE maintenance support functions
- Storage Protection (Store and Fetch)
- Byte Oriented Operands

- Clock Comparator and CPU timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling
- Program Event Recording
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- Monitoring

Programming Note: The system mode will be invoked at IPL time and supports operation of an appropriately installed Control Program. In S/370 mode operation with VM/SP is supported. Operation in a CMS-only environment is recommended. In ECPS/VSE mode, operation of SSX/VSE and DOS/VSE Release 3 is supported.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer. A 3278 Display Console Model 2A or a 3279 color Display Console Model 2C is required for this purpose. The Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4321 Processor hardware system, and one displays messages unique to the 3278 Display Console Model 2A or the 3279 Color Display Console Model 2C.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IPL and execute manual control functions on a remote 4321 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

ECPS/VM/370: The 4321 Processor provides ECPS/VM/370 support at Level 19. This support is compatible with VM/SP corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation and Virtual Interval Time. Limitations: May only operate when S/370 mode has been invoked by IPL.

Byte Multiplexer Channel (Optional): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and Table 4 below for details. The channel permits simultaneous operations of low speed devices. Operates at up to 18K bytes per second in single-byte mode. Up to 500K bytes per second in burst mode. See "IBM Channel Characteristics (GA33-1527)" for devices which may attach and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0.

Subchannels: The 4321 Byte Multiplexer Channel (#5248) provides up to 31 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 31 subchannels is reduced by 5 for the standard DASD Adapter Base (2), 8809 Magnetic Tape Unit Adapter (2) and the Communications Adapter Base (1). The remaining 26 subchannels are reduced by one for the Block Multiplexer Channel (#1421) and one for each telecommunication line on the Communications Adapter Base.

Block Multiplexer Channel (Optional): Provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and Table 4 below for details. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. The 231X and 33XX devices (and the 3830 or 3880 storage control units) do not attach.

- Data rate is up to 0.5 million bytes per second -- see "IBM 4321/4331 Model Group 1 Channel Characteristics (GA33-1527)", for details. Standard channel address is 1, a different address may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

- up to 128 non-shared subchannels, and
- up to 16 shared subchannels, each with devices in multiples of 8, up to a total of 128 devices

Integrated I/O Adapters: The following I/O adapters control the designated I/O devices:

DASD Adapter Base (standard)
 5424 Adapter
 Loop Adapter
 8809 Magnetic Tape Unit Adapter (standard)
 Display/Printer Adapter (16 ports, standard)
 Communications Adapter Base (standard)

Note: All data passing through the system for any I/O device interfaces with the data flow for other devices, producing I/O limitations. The limitations take two forms:

1. Hardware exclusivities
2. I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:
 - The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
 - The number and speed of lines attached to the Communications Adapter.
 - The number and class of overrunable devices on the Byte Multiplexer Channel.
 - The number and traffic on 3278 Model 2 or 3279 Models 2A, S2A attached to the Display/Printer Adapter.

It is necessary to consult "IBM 4321/4331 Channel Characteristics (GA33-1527)", to properly configure a 4321 with an I/O configuration that has not previously been analyzed.

DASD Adapter Base (Standard): One DASD Adapter is standard on the 4321 and provides direct attachment of 3310 #9202, 3370 #9201 and/or 3340/3344 #7851 Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 operate in fixed block mode. The 3340/3344 operates in Count-Key-Data (CKD) mode. When using 3340/3344 exclusively system throughput can be degraded by a factor of more than two compared with use of fixed block mode devices.

Note: One of the above features must be specified at minimum.

Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string. The maximum number of strings of each type of device on the DASD Adapter is:

1. Up to four 3310 Model A1s or A2s with 3310 Model B units attached, up to a maximum of 4 drives per string.
2. Up to four 3370 Model A1s with 3370 Model B1 units attached, up to a maximum of 4 devices (8 actuators) per string.
3. Up to two 3340 Model A2s with 3340/3344 Model B units attached, up to a maximum of eight drives per string. (3340/3344 Direct Attach feature #7851 is required.) Attachment of 3340/3344 is limited to two strings on the system.

As a transition aid and to allow the use of operating systems and programs which require Count-Key-Data (CKD) direct access storage, the 3340/3344 Direct Attachment and Direct Access Storage (DAS) Compatibility for emulation of 231X on 3310 or 3370 and 3330/3340 on 3370 are available. Operation with DAS Compatibility or the 3340/3344 Direct Attachment features in general will not achieve the same performance as the equivalent devices when attached to S/370 or 4300 processor channels. See performance notes included with the feature descriptions.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344

is limited to the static assignment of a shared string to one processor at a time.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	01	02	03	04	05	06	07
	2A	2B	2C	2D	2E	2F	
	4A	4B	4C	4D	4E	4F	
	6A	6B	6C	6D	6E	6F	
--AND--							
X10	11	12	13	14	15	16	17
	3A	3B	3C	3D	3E	3F	
	5A	5B	5C	5D	5E	5F	
	7A	7B	7C	7D	7E	7F	

With a directly-attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a S/3 Model 12 or 15 -- this is a read-only mode and is available as a conversion aid for users converting to the 4321 Processors from a S/3.

The Direct Access Storage Compatibility feature provides emulation of 231X, 3330 (100Mb/volume) or 3340 data formats on the 3370 Direct Access Storage and the emulation of 231X data formats on the 3310 Direct Access Storage. For address assignment of emulated volumes, refer to "IBM 4321/4331 Processor Compatibility Features (GA33-1528)".

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C and up to fifteen additional devices chosen from the list below:

- 3178 Display Station
 - 3179 Color Display station (base color)
 - 3180 Model 1 Display Station *
 - 3191 Display Station
 - 3192 Display Station
 - 3230 Terminal Printer Model 2 (350/45 cps burst mode)
 - 3262 Line Printer Model 1 and 11 (650 and 325 lpm)
 - 3268 Printer Model 2 and 2C (340 cps)
 - 3278 Display Station Model 2
 - 3279 Color Display Station Model 2A
 - 3287 Printer Models 1, 2, 1C and 2C (80 and 120 cps)
 - 3289 Printer Model 4 (400 lpm)
 - 4224 Printers Model 2XX (200/400 cps) (Non-IPDS Mode)
 - 4234 Model Dot Band Printer (300 lpm)
 - 4250 Printer
 - 5210 printer Models G01, G02
 - 6580 Displaywriter System Models A4, A6, A8, A10 (25-line display)
- * The 3081-1 is supported only when it is emulating a 3278 Model 2. The 3180 extended functions or larger screen formats are not supported.

These machines may be installed in any combination, provided that (1) only fifteen devices are installed and (2) no more than two System Printers (3262 and/or 3289) are included. A maximum of two 4250 Printers may be installed. The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287/3268/4224/4234 Printer may be used as a console hardcopy device; one or more 3287/3268/4224/4234 Printers may be used as hardcopy workstation devices; one or more 5210s may be used as high quality printers in 3287 mode only. The 3178 Display Station, 3179 Color Display Station (base color); 3180 Model 1 Display Station; 3278 Display Station Model 2; or 3279 Color Display Station

Models 2A, S2A may be used as workstations for user-written applications. The 6580 Displaywriter System emulates a 3278-2 Display Station, and optionally, a 3287-1/2 Printer. The 6580 may be used as a workstation for user-written applications and for hard copy, as a 3278-2 and 3287-1/2. Display/Printer Adapter support includes all standard functions of the 3274 Model X1B with the 3178; 3179; 3278 Model 2 or 3279 Models 2A, S2A attached. In addition, the following: 3180 Model 1; 3278 Model 2; or 3279 Model 2A, S2A special features are supported: Keyboard Numeric Lock (standard on the 3178, 3179, or 3180 Model 1), Audible Alarm (standard on the 3178, 3179, 3180 Model 1 or 3279), 3179 Color Display Station (base color), Security Keylock (standard on the 3178, 3179, and 3180 Model 1) and Switched Control Unit (Switched Control Unit is an accessory on the 3179, and 3180 Model 1). Other 3180 Model 1 and 3278 Model 2 or 3279 Model 2A, S2A special features are not supported. When used as workstations, 3180 Model 1 Display Station keyboard feature codes #4600 or #4601 may be selected or on the 3278, or 3279 Display Station keyboard feature codes #4621, #4622, #4623, #4627 may be selected. If two different keyboards are required for a workstation, one must be #4621. Addresses for these devices are selected at installation time from the range 009 through 01F.

The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation Adapter (#8332) and Specify #9842 4321 must be ordered for attachment of Displaywriter.

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4321 Processor. This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below) or a data capacity of 246,272 bytes organized in 1,924 sectors of 128 bytes each (for use in exchanging data with another 4321 Processor). Each Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with DOS/VSE refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and S/1 and S/3, S/32, S/34, and S/38. One diskette is shipped with the feature. Device address is selected at installation time from the range 009 through 01F.

5424 Adapter (Optional): Provides native attachment of 5424 Multi-Function Card Unit Models A1 or A2 for 96-column card operations -- Device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4321 is a native attachment method for the 3640 Plant Data Communications Terminals -- 8775 Display Terminal Models 1 and 2 -- 3287 Printer -- 3274 Control Unit Model 51C and 61C -- 3276 Control Unit Display Station with their associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexibility.

A maximum of two direct attached loops and two data link adapters are supported. Each of the direct attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one IBM 3843 Loop Control Unit as point-to-point or up to 4 Loop Control Units as multipoint configuration. Details on programming information are provided in the IBM 4321/4331 Loop Adapter Programming Guide (SC31-0500-0). User-written programs for loop-attached terminals reside in the 4321 Processor storage and are controlled by VSE and ACF/VTAME or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition IBM offers a PRPQ to CICS/VS This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and

exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4321 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

Terminal initialization
Terminal re-initialization
3642 encode check handling
Transaction selection

Communications network management problem determination support for 4321 loop-attached 8775 Display Terminals, 3276 Display Control Stations and 3274 Model 51C and 61C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal Models 1, 2 -- 3642 Encoder Printer Models 1, 2 -- 3643 Keyboard Display Model 3, 4 including #4920 Badge and Document Encoder -- 3644 Automatic Data Unit -- 3645 Printer -- 3646 Scanner Control Unit -- 3647 Time and Attendance Terminal -- 8775 Display Terminal Models 1, 2 -- 3287 Printer Models 11, 12 -- 3274 Control Unit Model 51C and 61C -- 3276 Control Unit Display Station Models 11-14 with their associated terminals -- 3843 Loop Control Unit. Device addresses are 040 through 07E.

8809 Magnetic Tape Unit Adapter (Standard): Provides native attachment of 8809 Model 1A and up to five additional 8809 tape units (consisting of a mix of 8809 Model 2s and 3s) -- allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for loading or offloading DASD devices or in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read Backward commands are not supported, the Read Backward operation is simulated in the Logical IOCS (MTMOD) of DOS/VSE. Standard channel address is 3. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

Communications Adapter Base (Standard): The 4321 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocal unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit Terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For Communications Adapter Base details, see "Communications and Loops" below.

IBM Stand-Alone Modems

Modems	Speed (bps)	Lines
-----	-----	-----
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw
3864-1,2	4800/2400	Nonsw
3865-1,2	9600/4800	Nonsw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3868-3,4	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw
3874	4800/2400	Nonsw
3875	3600/7200	Nonsw
5811-10	2400 to 19200	Limited distance modem
5811-18		Rack mount ver-

5811-20	2400 to 19200	sion of Model 10
5811-28		Nonsw baseband Rack mount ver-
5812-10	2400 to 19200	sion of Model 20
5812-18		Nonsw baseband Rack mount ver-
5865-2,3	9600/7200/ 4800	sion of Model 10
5868-52		Nonsw voice grade Rack mount ver-
5866-2,3	14400/9600	sion of 5865-2
5868-62		Nonsw voice grade Rack mount ver-
		sion of 5866-1,2

(Canada only) The following modems are supported with the Switched Network Backup feature -- see M3863, 3864, 3865, 3872, 5865 and 5866 pages for details:

Modems	Speed (bps)	Lines
-----	-----	-----
3863-1,2	2400/1200	Nonsw voice grade
3864-1,2	4800/2400	Nonsw voice grade
3865-1,2	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw voice grade
5865-2,3	9600/7200/ 4800	Nonsw voice grade
5866-2,3	14400/9600	Nonsw voice grade

Note: Only 4-wire SNBU is supported by 5865 and 5866 modems. <)

Non-IBM Modems: Non-IBM modems that comply with EIA RS 232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- Other Automatic Calling Equipment which complies with EIA RS 366 or CCITT V.25 may be connected to the Autocal Unit Interface (#1020) under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.
- 4250 Printer Attachment: Specify #9260 for 4250 attachment.
- 6580 Displaywriter Attachment: Specify #9842 for 6580 attachment.
- Specify #9841 on 4321 must be ordered for attachment of 3268 or 4234 Model 1 to the 4321. Provides microcode and/or maintenance documentation if machine is below EC 366585 (microcode for 4321) and/or below EC 366584 (maintenance documentation) for all Models.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4321 Processor. It provides service personnel the capability of remotely controlling the 4321 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for the connection

of the telephone interface cable provided by IBM to the telephone network.

- **Remote Operator Console Facility (ROCF):** This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4321 manual control functions for a remote 4321 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4321 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4321 are suppressed when ROCF is in use. Field Installation: Yes.

* 3275 Model 2 can only be obtained on an "as available" basis.

- **Loop-Attached Terminals:** The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274 (Model 51C or 61C) and/or 3276 Control Units are attached to the system via Loop Adapter 1 and/or 2 (#4830, #4831) and/or Data Link Adapters (#4840).

Specify	Selected Terminals
#9251	3641 Reporting Terminal/3647 Time and Attendance Terminal
#9252	3642 Encoder Printer
#9253	3643 Keyboard Display
#9254	3644 Automatic Data Unit (ADU)
#9256	3646 Scanner Control Unit
#9257	8775 Display Terminal 3287/3645 Printer 3274 (Model 51C or 61C) and 3276 Control Unit and 3104 Display Terminal
#9258	3643 Keyboard Display with #4920

- **Console Table:** A console table is available -- see #1550 or the 4331-1 Accessories Section for details. Book Rack and Cable Holder -- see #1480 or the 4331-1 "Accessories".
- See 3278 Display Console Model 2A or 3279 Color Display Console Model 2C for console cabling.

SPECIAL FEATURES

Note:

%x: Denotes feature supplies diskette for System Diskette facility.

%z: Denotes System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter, (when more than three line features are attached), and the Adapter Logic. Maximum: One. Field Installation: Yes. Prerequisites: #1002 or for the Loop Adapter (#4830) and/or Communication Adapter with more than three line attachments #4895 and/or #4696.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). Maximum: One. Field Installation: Yes. Prerequisites: #1001.

Block Multiplexer Channel (#1421): Provides means of attaching I/O devices. Up to 8 control units may attach to each channel. Disconnect during command chaining allows multiple I/O devices to operate concurrently. 231X as well as 3830 and 3880 Control Units with associated DASD do not attach. See DASD Adapter for attachment of 3340/3344/3310/3370 devices. Data transfer rates up to 0.5 million bytes per second. Maximum: One. Field Installation: Yes. Pre-

requisites: For certain control units/devices the processor requires Power Interface (#5531, #5532). See Table 4.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, use the following procedure.

Note: An interactive HONE aid is available dependent on the control program or program product device support to facilitate this procedure.

1. Consulting Table 2, determine the microcode groups required to support the features and I/O to be installed.
2. On Table 3, place a checkmark in the appropriate rows. Note that each microcode group is required only once, even if it supports multiple functions of the 4321 Processor. The only exception to this is microcode group 2 where 2,048 bytes of Processor Storage are required per megabyte of virtual storage as defined in the Table 3 notes.
3. Find the sum of each of the two columns for the required microcode groups.
4. The total from Column A must pass the test: When the total from Column A exceeds 262,144 bytes, an invalid configuration has been selected. See the Note below.
5. Add the total of column A to the total from Column B, subtract control storage of 131,072 bytes and round up to the next multiple of 4,096 bytes.

The results of Step 5 determine the amount of Processor Storage occupied by microcode and should be subtracted from the Processor Storage size ordered to determine the amount available for the user. The storage for Group 7 specified in Column B (DAS Compatibility #7901) is only occupied if the feature is activated at IPL time.

Note: Too many features/options have been selected. Inspect Tables 2 and 3 and determine which feature(s) of lower priority should be deleted from the configuration.

TABLE 2

Function/ Feature Installed	Micro- code Group
4321 Processor	1
Processor Storage	2
3310 attached (#9202)	3
3370 attached (#9201)	4
3340/3344 Direct Attach (#7851)	5,6
Direct Access Storage Compatibility (#7901)	5,7
BSC lines installed (#9671-#9678)	8
S/S lines installed (#9681-#9688)	9
SDLC lines installed (#9691-#9698)	10

Note: The Microcode Group 1 contains 4321 Processor standard hardware features. For details, see "Highlights".

TABLE 3

Micro code Group	- A - Control Storage or Pro- cessor Storage	- B - Pro- cessor Storage (only)	Notes
1	187392	49152	
2	-	2048	In S/370 mode or for each 1Mb of vrtl storage in ECPS: VSE mode, in steps of 2,4,8, 16Mb.
3	4608	11250	
4	9316	10000	
5	5760	200	
6	22528	11600 8800 1800	Plus Per 3340 buffer For a second string of 3340s attached to the DASD adapter.

9	5120	-	
10	9216	1024	

DASD Adapter (Standard): Allows attachment of the 3310, 3370 and 3340/3344 DASD to the 4321 Processor. Up to four strings of devices may be attached to each adapter. The attachable device types may be intermixed on each adapter but not within a string. The maximum number of strings of each type of device on each DASD Adapter is:

- Up to four 3310 Model A1s or A2s with 3310 Model B units attached, up to a maximum of 4 drives per string.
- Up to four 3370 Model A1s with 3370 Model B1 units attached, up to a maximum of 4 devices (8 actuators) per string.
- Up to two 3340 Model A2s with 3340/3344 Model B units attached, up to a maximum of eight drives per string - (3340/3344 Direct Attach feature #7851 is required). Attachment of 3340/3344 is limited to two strings on the system.

String Switch Capability allows sharing of 3340 Model A2 and/or 3370 Model A1 and associated drives with another IBM processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340 Model A2 or 3370 Model A1 must have the String Switch feature #8150 installed. String switch support for 3340/3344 is limited to the static assignment of a shared string to one processor at a time. For data rate and attachment limitations for other devices and communications lines refer to "IBM 4321/4331 Processor Channel Characteristics" (GA33-1527), which contains tables of pre-analyzed configurations. Prerequisites: 3340/3344 requires #7851 - see Table 2 for microcode storage requirements. Specify: #9202%z if 3310 and/or #9201%z if 3370 attaches to the DASD Adapter. #9316 if String Switch Capability is required with 3370.

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. Limitations: Not supported by VM/SP. Maximum: One. Field Installation: Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. Maximum: One. Cable Order: Required. Field Installation: Yes. Prerequisites: External Devices must meet the interface specifications outlined in S/360 Direct Control Feature OEMI (GA22-6845).

5424 Adapter (#3901%x): Allows attachment of one 5424 Multi-Function Card Unit Model A1 or A2. Limitations: The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed with the Loop Adapter (#4830). Maximum: One. Field Installation: Yes. Prerequisites: #1001 and #1002.

Byte Multiplexer Channel (#5248): The byte multiplexer channel attaches S/370 byte multiplex devices. The data rate of the channel is up to 18K bytes per second in single byte interleaved mode and up to 500K bytes per second in burst mode. For data rates achievable for specific configurations, see "IBM 4321/4331 Channel Characteristics" (GA33-1527). Up to eight control units may be attached. See Input/Output Attachments section above for details on sub-channels. Maximum: One. Field Installation: Yes. Prerequisites: For certain control units/devices, the processor requires Power Interface (#5531, #5532). See Table 4.

Power Interface (#5531), Add'l (#5532): Provides power control to the 4321 Processor for control units attaching to the 4321 Byte Multiplexer Channel and Block Multiplexer Channel. Table 4 below lists the control units/devices for which this feature must be installed in the 4321 Processor - Power Interface (#5531) allows attachment of up to eight of these control units; Power Interface, Add'l (#5532) allows attachment of eight additional control units for a maximum of 16 per processor. Maximum: One of #5531; one of #5532. Field Installation: Yes. Prerequisites: #5532 requires #5531.

TABLE 4

Control Units/Devices Requiring Power Interface Features

- Mandatory:
 - 1255 Magnetic Character Reader
 - 1287 Optical Reader
 - 1288 Optical Reader
 - 1419 Magnetic Character Reader
 - 1442 Card Read Punch Model N1
 - 1442 Card Punch Model N2
 - 1443 Printer Model N1
 - 2415 Magnetic Tape Unit and Control
 - 2501 Card Reader Model B1 and B2
 - 2520 Card Read Punch Model B1, B2, B3
 - 2701 Data Adapter Unit
 - 2702 Transmission Control*
 - 2703 Transmission Control*
 - 2803 Tape Control
 - 2821 Control Unit Mdls 1,2,3,5 and 6
 - 2822 Paper Tape Reader Control*
 - 2840 Display Control*
 - 3272 Control Unit
 - 3411 Magnetic Tape Unit and Control
 - 3505 Card Reader
 - 3540 Diskette Input/Output Unit
 - 3704 Communications Controller
 - 3705 Communications Controller
 - 3791 Controller
 - 3800 Printing Subsystem
 - 3803 Tape Control
 - 3811 Printer Control Unit
 - 3881 Optical Mark Reader Model 1

3886 Optical Character Reader Model 1
3890 Document Processor
3895 Document Reader/Inscriber

2 - Not Mandatory, but can utilize
Power Interface features:

3274 Control Unit
3340 Direct Access Storage Facility
3370 Direct Access Storage
3203 Printer Model 5

* No longer available

3340/3344 Direct Attachment (#7851%z): A feature allowing 3340 Model A2s to attach to a DASD Adapter. Up to two 3340 Model A2s per system may attach to either adapter. Up to three 3340/3344 Model B units may attach to each 3340 Model A2. S/3 Data Import: With the VSE/IBM System/3-3340 Data Import utility program (5746-AM3), 3348 Data Modules which have been written on a 3340 attached to a S/3 can be read on any directly-attached 3340 drive. The String Switch Capability allows sharing of 3340 Model A2 drives (with #8150 installed) and associated drives, with another IBM processor or control unit that supports the DASD and string switching. String switch support is limited to the static assignment of a shared string to one processor at a time. Limitations: (1) Attachment of 3340/3344 and/or use of the DAS Compatibility is limited to two strings on the system. (2) If one string of 3340/3344s is attached to a DASD Adapter (#3201), only one string of 3310/3370s can perform DASD emulation. If two strings of 3340/3344s are attached, no 3310/3370s can perform DASD emulation. Maximum: One. Field Installation: Yes. Prerequisites: 3340 Model A2. See Table 2 for microcode storage requirements. Specify: #9315 if String Switch Capability for 3340 required, #9317 if 3344 is installed.

Note: Use of this feature introduces additional processor and channel demands, and can have a significant effect on system performance, particularly in batch environments with heavy I/O load and/or if multi-track operations are used. Performance considerations should be carefully reviewed before proposing use of the 3340/3344.

Direct Access Storage Compatibility (#7901%z): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100Mb/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 mode under VM/SP, in ECP/S-VSE mode under DOS/VSE. Under DOS/VSE data sets in fixed block format and in emulated format can co-reside on the same 3310/3370 volume. With DOS/VSE, a variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With VM/SP partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Compatibility Type	Max Number of Emulated Full Volumes		
	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63

3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to "IBM 4321/4331 Compatibility Features" (GA33-1528).

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: (1) Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. (2) Operation of emulation and directly-attached 3340/3344 is limited to two strings on the system. (3) One type of emulation can be activated at IPL time. (4) 3330 Model 11 cannot be emulated. (5) Emulation cannot be used on 3370 drives which are shared via a string switch. (6) VM/SP supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/SP or CMS. Emulated 2311 is not supported by VM/SP. Program Order: The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, 5745-030 or combined with VSE/Advanced Functions and VM/SP (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. Maximum: One. Field Installation: Yes. Prerequisites: 3370 (#9201) and/or 3310 (#9202) specification. See Tables 1 and 2 for microcode storage requirements.

COMMUNICATIONS and LOOPS

Communications Adapter Base (Standard): Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1527. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to bps and may operate concurrently with other lines provided the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/SP.

Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to eight line features without internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) with clock.
- Up to eight line features with internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) without clock.
- One synchronous high-speed line feature.
- Up to eight line features with integrated modems.
- Up to eight line features with local attachments.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-Keyboard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half-speed operation for synchronous lines only (for both clocked and non-clocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the CE:

- Duplex instead of half-duplex connection (2-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High-speed operation for one line (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Limitations: (1) SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/SP with DOS/VSE running as a guest. (2) Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. (3) The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one, capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines refer to "IBM 4321/4331 Processor Channel Characteristics" (GA33-1527), which contains tables of pre-analyzed configurations. Prerequisites: #1001 is required when more than three telecommunications line features are attached. See Table 2 for microcode storage requirements. Specify: See Table 5 "Communications Adapter Configuration Features and Position Codes", for required specify codes for each line feature attached.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

TERMINALS SUPPORTED

The Data Communications Equipment and remotely attachable Data Terminal Equipment (abbreviated "terminals") supported by the Communications Adapter are shown in the table below:

SDLC Terminals Supported:

Type	Speed in K bps				
Terminals:					
3271-11,					
-12 (3)	X	X	X	X	X

Notes:

- 3705 supported as a primary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
- Participant as a primary or a secondary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
- Not supported by ACF/VTAME.
- DSLU (5668-006) is required for 7426 or 8775-11, -12 with downstream loadable functions).
- Supported as a 3770.
- Supported as a 3770 or 3791.
- With SDLC/BSC Switch in SDLC mode.
- The maximum speed supported is 56K bps.
- Supported as a 3274 Model 1C or 3770

4. Supported as a 3276 Model 1, 2, 3, 4, nonswitched connection only.
5. With Communications Adapter.
6. 19,200 - bps in line position 1.
7. See M3631 and/or 3632 pages for 3631/3632 features required and software requirements for host connection.
8. Equivalent to 54XX (S/3).
9. Equivalent to 3741 Model 2, 4.
10. Equivalent to 3275 Model 1, 2.
11. Equivalent to 3271 Model 1, 2.
12. Supported as a 2772.
13. Supported as 3280
14. Supported as a 3271 Model 2.

Start/Stop Terminals Supported: Only terminals using IBM Terminal Control - Type 1 are supported.

IBM I Line Control Speed (bps)

TYPE	75	134.5	300	600	1200
2740-1		X			
2740-2	X	X		X	
2741		X			
3767-1 (1)		X	X	X	X
3767-2 (1)		X	X	X	X
3767-3 (1)		X	X	X	X
5100 (2)		X	X		
5110		X	X		
CMCST (1)		X	X		

1. Equivalent to 2740 and/or 2741: Speed 134.5 bps needs 3767 RPQ

2. Equivalent to 2741.

Autocall Unit Interface (#1020%x): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS 366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. Limitations: Does not operate with High-Speed Modem Adapter (#4720), any features with 1200 bps Integrated Modem or with any nonswitched lines. Maximum: Two. Field Installation: Yes. Prerequisites: #3701 (in switched operation) for each Autocall Unit Interface installed. Specify: Line position, see Table 5 below.

EIA/CCITT Interface (#3701%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Nonclocked Modems (#4696), then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. Maximum: Eight. Field Installation: Yes. Prerequisites: One #4695 or #4696 is required for each feature #3701 installed. Specify: Start/Stop, SDLC and/or BSC operations are possible. See Table 5 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General Purpose Terminals 8775 Models 1, 2 and 3287 Models 11, 12 and/or Control Units 3274 Model 51C and 3276 Models 11-14 with the associated terminals to the 4321 Processors. Loop Adapter 1 and 2 (#4830, #4831) provide for direct attachment. A maximum of two Data Link Adapters (#4840) provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter (#4840) can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct attached loops at 9600 bps or data link attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments

- 3641 Reporting Terminal Models 1, 2
- 3642 Encoder Printer Models 1, 2
- 3643 Keyboard Display Models 3, 4 including #4920 Badge and Document Encoder
- 3644 Automatic Data Unit
- 3645 Printer
- 3646 Scanner Control Unit

3647 Time and Attendance Terminal
8775 Display Terminal Models 1, 2
3287 Printer Models 11, 12
3274 Control Unit Models 51C, 61C with the associated terminals
3276 Control Unit Display Station Model 11-14 with the associated terminals

Control Units and Associated Terminals

3274 Control Unit Model 51C, 61C
3178 Display Station
3179 Color Display Station
3180 Model 1 Display Station
3278 Display Station
3279 Color Display Station
3262 Line Printer
3268 Printer Model 2, 2C
3287 Printer
3289 Line Printer
5210 printer Models G01, G02
6580 Displaywriter System, Model A4, A6, A8, A10 (25-line display)
6580 Displaywriter System, Model B4, B6, B8, B10 (66-line display)
3276 Control Unit Display Station Model 11-14
3178 Display Station
3179 Color Display Station
3180 Model 1 Display Station
3278 Display Station
3279 Color Display Station
3262 Line Printer
3268 Printer Model 2, 2C
3287 Printer
3289 Line Printer
4234 Model 1 Dot Band Printer
6580 Displaywriter System, Model A4, A6, A8, A10 (25-line display)
6580 Displaywriter System, Model B4, B6, B8, B10 (66-line display)

In addition the following devices can be attached at 38,400 bps:

8775 Display Terminal Models 1, 2
3287 Printer Models 11, 12
3274 Control Unit Model 51C with the associated terminals

For the attachment of 3640 terminals it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

Cable length for direct attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps.

For data link attached loops see 3843 Loop Control Unit. For details refer to "IBM Multi-use Communications Loop Planning Guide" (GA23-0038).

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the "IBM Multi-use Communications Loop Planning Guide" (GA23-0038), and Installation Guide (GA23-0039). The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to "IBM 4321/4331 Processor Loop Adapter Feature, Operating Procedures" (GA33-1538), and "Problem Determination Procedures" (GA33-1540).

Notes:

1. Loop Accessories are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See

M4331-1 "Accessories" section for details and ordering information.

2. An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N 1657320.

Communications Facilities: See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 8775 and/or 3287 terminals and/or 3274 (Model 51C or 61C) and/or 3276 Control Units or 38.4K bps for 8775 and/or 3287 terminals and/or 3274 (Model 51C or 61C) Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Field Installation: Yes. Prerequisites: Adapter power prerequisite (#1001).

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 8775 and/or 3287 terminals, and/or 3274 (Model 51C or 61C) and/or 3276 Control Units, or 38.4K bps for 8775 and/or 3287 terminals and/or 3274 (Model 51C or 61C) control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Field Installation: Yes. Prerequisites: #4830.

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4321 processor. The feature provides for the attachment of one external modem complying with EIA/ CCITT. support will be provided for nonswitched lines only Transmission speed can be 2400, 4800, or 9600 bps, with half-speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link attached loops. Support will be provided for the same terminals as on the direct attached loop. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: Two. Field Installation: Yes. Prerequisites: #4830.

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 (#4830, #4831) or Data Link Adapters (#4840) has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Microcode Program Space Bytes	System Control Space Bytes
Microcode Base	42836	7880
One or multiple		
3641 and/or 3647	7800	1060
One or multiple		
3642	5900	580
One or multiple		
3643 w/o #4920	8800	3450
One or multiple		
3643 w/#4920	9400	3450
One or multiple		
3644	4900	-
One or multiple		
3646	2900	256
One or multiple		
8775 and/or 3287, 3274, 3276, 3645	2600	-

Terminal*
Control

		Space
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204
	-----	-----
Total 1	Total 2	

*For additional information on buffer space refer to the "IBM 4321/4331 Loop Adapter Characteristics" (GA33-1534).

The storage requirements need to be validated by DP because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the 4321 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3,876, an invalid configuration has been selected. A trade-off between features must be considered.

4321 Processor Feature/Facility	System Diskette Records
4321 Basic	2854
3310 Att. (#9202)	66
3370 Att. (#9201)	70
3340/3344 Direct Att. (#7851)	120
3340 Att. or DAS Compatibility (#7851 or #7901)	24
DAS Compatibility (#7901)	170
Start/Stop	
Transmission Mode (#968X)	20
BSC Transmission Mode (#967X)	24
SDLC Transmission Mode (#969X)	52
364X Terminal Att. (#9251, #9252, #9253, #9254, #9256)	665

The maximum number of system diskette records may not exceed 3876.

Maximum Terminal Attachments: The maximum number of terminals that can be attached to the 4321 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 8775 terminals or 3274 (Model 51C or 61C) or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see "IBM Multi-use Communications Loop Planning Guide" (GA23-0038).

Line Attachment Base For Clocked Modems (#4695%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit Terminating Equipment) which provide clocking and comply with CCITT V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network. See the various line features below to determine when it is required. Limitations: A maximum of eight Line Attachment Bases may be installed on 4321 Communications Adapter. Each feature #4695 in-

stalled reduces by one the number of feature #4696 allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

Line Attachment Base For Nonclocked Modems (#4696%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit Terminating Equipment) which do not provide clocking. See the various features below to determine when it is required. The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation. Otherwise, the clock speed can be wired at installation to one of the following:

- Start/Stop: 75, 300, 600, or 1200 bps.
- BSC: 600 bps.
- SDLC: 600 bps.

For BSC or SDLC operations, if 1200 bps is wired, then full-speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. Limitations: A maximum of eight Line Attachment Bases may be installed on 4321 Communications Adapter. Each feature #4696 installed reduces by one the number of feature #4695s allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: Feature #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

High-Speed Modem Adapter (#4720%): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to bps. Limitations: For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see "IBM 4321/4331 Channel Characteristics" (GA33-1527). Cannot be installed with X.21 Adapter for Nonswitched Networks (#5655) if its speed is 48,000 bps #9831. Maximum: One. Field Installation: Yes. Prerequisites: #4695. Specify: BSC and/or SDLC operations are possible -- see Table 5 for Line Position Code and Transmission Mode Codes.

Local Attachment Interface (#4801%): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the Customer Engineer at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

- 800 meters at 1200 bps
- 400 meters at 2400 bps
- 200 meters at 4800 bps
- 100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. Cable Order: Customer-supplied cable for in-door use. Maximum: Eight. Field Installation: Yes. Prerequisites: #4695. Specify: SDLC and/or BSC operations are possible, see Table 5.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 Point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. Limitations: If feature #5655 operates at 48,000 bps (specify #9831), then the following limitations apply: (1) High-Speed Modem Adapter (#4720) cannot be installed -- (2) For speed limitations, refer to the Communications Adapter Base feature description. Maximum: Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. Field Installation: Yes. Prerequisites: One #4695 is required for each #5655 installed. Specify: SDLC operation must be specified for this feature -- see Table 5 for line position, trans-

mission mode and transmission speed codes. Note: #9831%x is required for 48,000 bps operation.

Table 5

SDLC (1)		9691	9692	9693	9694	9695	9696	9697	9698		

Notes:

- BSC or SDLC transmission mode with any line attachment feature.
- Start/Stop transmission mode only with EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696) or with any other features offering 1200 bps Integrated Modems (with prerequisite #4696).
- Must be associated with EIA/CCITT Interface (#3701 and prerequisite #4695 or #4696). Maximum of two #1020s may be installed.
- The aggregate data rate of the Communications Adapter is 64,000 bps - Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage - see Table 2 for microcode storage requirements.
- When changing #9444 to/from #9471, no new hardware or diskette is required.

%x Feature supplies diskette for System Diskette facility.

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

MODEL CONVERSIONS

* MODEL UPGRADES FROM 4321 TO 4331 and 4361 ARE NO LONGER AVAILABLE.

Customer price quotations and customer order acknowledgement letters for purchase machine conversion must state: "Installation of this machine model conversion involves the removal of parts which become the property of IBM".

Field upgrade from 4321 to 4331 Model Group 2 is possible. After the upgrade the machine type of the 4321 is changed to 4331 Model Group 2 by the CE. Downgrades to 4321 from 4331 is not recommended for field installation. Refer to "Equipment Orders" in the GI section for details of this "Not Recommended for Field Installation".

The 4321 type conversion to a 4331 Model Group 2 has a one year service and parts warranty on those components provided by IBM with the type conversion.

ACCESSORIES

See M4331-1 "Accessories" for additional information and field installation of Console Table (#1550), Book Rack and Cable Holder (#1480) and Loop Accessories and Loop Cables.

SUPPLIES (NONE)

4331 PROCESSOR MODEL GROUPS 1, 2

(NO LONGER AVAILABLE)

- | The 4331 is no longer available. No new RPQs will be accepted.
- | * UPGRADES FROM 4321/4331 TO 4361 PROCESSORS ARE NO LONGER AVAILABLE.

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

Provides the power, control, logic and storage circuitry necessary for the arithmetic, logic and processor storage functions of the 4331 Processor models.

MODEL GROUPS 1, 2

4331-MG 1

Model I1 I01: 524,288 bytes of Processor Storage -- no Buffer Storage.

Model J1 J01: 1,048,576 bytes of Processor Storage -- no Buffer Storage.

4331-MG 2

Model J2 J02: 1,048,576 bytes of Processor Storage -- 8,192 bytes of Buffer Storage.

Model K2 K02: 2,097,152 bytes of Processor Storage -- 8,192 bytes of Buffer Storage.

Model KJ2 KJ2: 3,145,728 bytes of Processor Storage -- 8,192 bytes of Buffer Storage.

Model L2 L02: 4,194,304 bytes of Processor Storage -- 8,192 bytes of Buffer Storage.

For clarity, a separate product description is provided for Model Group 11. Tables of supported communications equipment included in this page set are common for all 4331 Models.

Maximum Configuration: The maximum number of DASD/8809 Adapters and Byte and/or Block Multiplexer Channels which are available are shown below:

4331 Model Group 1	Maximum		
DASD Adapter	1		
8809 Adapter	1		
Byte Multiplexer Channel	1		
Block Multiplexer Channel	1		

4331 Model Group 2	Options (select 1 column)		
DASD Adapter	1	1	1
DASD Adapter, Add'l	1	1	-
8809 Adapter	1	-	-
Byte Multiplexer Channel	1	1	1
Block Multiplexer Channel	1	1	1
Block Multiplexer Channel, Add'l	-	1	1
High-Speed Block Multiplexer Channel	-	-	1

The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to "IBM 4331

Processor Channel Characteristics", GA33-1527 (Model Group 1) or GA33-1535 (Model Group 2), which contains comprehensive tables of pre-analyzed configurations.

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console Model 2A or a 3279 Color Display Console model 2C with keyboard is required for this purpose.

HIGHLIGHTS

Depending on the model, the processor can contain up to 4,194,304 bytes of monolithic processor storage. Storage is high-density single-bit cell design. Data flow is four bytes parallel. Processor storage cycles are model dependent. The 4331 Model Group 1 storage fetch cycle is 900 nanoseconds for four bytes and the store cycle is 1,300 nanoseconds for four bytes. The 4331 Model Group 2 fetch and store cycles for the buffer are each 200 nanoseconds for four bytes. Buffer storage is automatically replenished from processor storage in 64-byte units at a time. The 64 byte fetch cycle requires 2.6 microseconds, the store cycle requires 3.1 microseconds. The processor is microcode-controlled.

Note: The microcode which controls system operations resides in both Processor Storage and Reloadable Control Storage, reducing the Processor Storage available for user programming. For 4331 Model Group 1 without the optional Control Storage Expansion feature installed, Processor Storage available for the user is reduced from that installed by at least 53,248 bytes. For 4331 Model Group 1 with the optional Control Storage Expansion feature installed or 4331 Model Group 2, Processor Storage is reduced from that installed by at least 16,348 bytes (4331 Model Group 2 includes 131,072 bytes of Control Storage). Table 1 below lists the storage requirements for system microcode.

Standard Functions

- For 4331 Model Group 1 -- 524,288 bytes or 1,048,576 bytes of processor storage. For 4331 Model Group 2 -- 1,048,576 bytes to 4,194,304 bytes of processor storage. 4331 Processor configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 for details.
- ECPS:VSE mode or S/370 mode. In S/370 mode, both Extended Control (EC) and Basic Control (BC) are available. The 4331 Processor operates in either S/370 mode or in Extended Control Program Support: VSE mode. The system mode is selectable at Initial Program Load (IPL) time and determines the base operating characteristics of the machine: S/370 mode allows operation of certain releases of OS/VS1, VM/370, DOS/VSE, DOS/VS and DOS. (See "Programming Note" below for details.) ECPS: VSE mode supports operation of DOS/VSE and SSX/VSE, offering enhanced systems performance.
- Display/Printer Adapter allows attachment of:
 - 3178 Display Station
 - 3179 Color Display Station (base color)
 - 3180 Model 1 Display Station
 - 3191 model A1X, B1X, D1X, D3X
 - (Except LAD > 3191 model A3X, B3X <)
 - 3192 Model C1X, C3X, D1X, D3X, F1X, F3X
 - 3262 Line Printer model 1 (650 lpm system printer)
 - 3262 Line Printer model 11 (325 lpm system printer)
 - 3268 Printer model 2, 2C (340 cps)(1)
 - 3289 Line Printer model 4 (400 lpm system printer)
 - 3278 Display Station model 2, and keyboards
 - (Canada only > 3270 Personal Computer - Control unit terminal mode only(2) <)
 - 3279 Color Display Station model 2A or 02X and keyboards

MACHINES

- 3278 Display Console model 2A, keyboard and control panel
- 3279 Color Display Console model 2C, keyboard and control panel
- 3287 Printer models 1, 2, 1C and 2C
- 4224 Printer models 2XX (200/400 cps) (Non-IPDS Mode)
- 4234 model 1 Dot Band Printer
- 4250 Printer
- Personal Computer XT/370 (5160 model 589) (Control Unit Terminal Mode only) **
- Personal Computer AT/370 (5170 model 599 and 739) (Control Unit Terminal Mode only) **
- 5150 attached to 3278/3279
- 5150/5160/5170 PC with 3278/3279 Emulation Adapter
- 5160 with XT/370 Option Kit and 3278/79 Emulator Adapter (Control Unit Terminal Mode only) **
- 5170 with AT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) **
- 5210 printer models G01, G02
- 6580 Displaywriter System, Model A04, A06, A08, A10 (25-line display)

Specify #9841 on 4331 must be ordered for attachment of 3268 to the 4331 Model Group 1. Provides microcode and/or maintenance documentation if machine is below EC 366585 (microcode for 4331 Model Group 1) or below EC 366586 (microcode for 4331 Model Group 2, 11) and/or below EC 366584 (maintenance document) for all models.

- (Canada only > Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer and Personal Computer XT/370 and AT/370. <)
- The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (#8332) and specify #9842 in 4331 must be ordered for attachment of Displaywriter.
- The System Diskette Facility is the microcode loading system for the 4331 Processor. The diskette facility reads and writes from removable magnetic diskettes that provide all of the microcode for the 4331 Processor. The diskettes shipped with the 4331 Processor will supply the required microcode for diagnostics, standard functions, and the special features ordered. The System Diskette Facility also allows storage of failure data from 4331 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.
- Reloadable Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode in support of standard functions and special features of the 4331 Processor. The Reloadable Control Storage is not available to the user. Tables 1 and 2 list the Reloadable Control Storage requirements for system microcode.

4331 Model Group 1 includes 65,536 bytes of Reloadable Control Storage. An additional 65,536 bytes is available as an optional feature.

4331 Model Group 2 includes 131,072 bytes of Reloadable Control Storage.

In addition to Reloadable Control Storage, 4331 Model Group 2 contains 12,288 bytes of Read-Only Control Storage.

- Remote Support Facility (RSF) is an IBM CE tool permitting IBM Field Technical Support Center specialists to remotely monitor and/or perform problem diagnosis on the 4331 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization), remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a 3275 (real or emulated) terminal at a host location.

- One level addressing facility for improved virtual storage control by DOS/VSE and SSX/VSE (ECPS:VSE mode).
- Channels with virtual storage addressing (ECPS:VSE mode).
- Channel Indirect Data Addressing (in S/370 mode).
- Data Streaming Mode can operate on the High-Speed Block Multiplexer channel (not available on Model Group 1). The 3380 is not supported on the 4331.
- S/370 Universal Instruction Set.
- Extended Precision Floating Point.
- Conditional Swapping.
- CE maintenance support functions.
- Storage Protection (Store and Fetch).
- Byte Oriented Operands.
- Clock Comparator and CPU timer.
- Time-of-Day Clock.
- Interval Timer.
- PSW Key Handling.
- Control Registers.
- Machine Check Handling.
- Program Event Recording.
- Monitoring.
- Clear I/O.
- Move inverse instruction (not used by IBM programs).
- 8,192 bytes of high-speed buffer storage (4331 Model Group 2 only).

Programming Note: The ECPS:VSE mode may be invoked at IPL time and supports operation of an appropriately generated DOS/VSE Control Program with VSE/Advanced Functions Release 1 and 2, or the Small Systems Executive/VSE.

In S/370 mode, operation of DOS/VSE with VSE/Advanced Functions Release 1 and 2 (generated for use in S/370 mode), VM/370 Release 6 with or without VM/System Product or VM/BSE Release 2 or VM/SE Release 2, and OS/VS1 Release 7 with or without VS1/BPE are supported. Although not supported, DOS Release 26 and DOS/VS Release 34 will operate on the 4331 Processor when in S/370 mode.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer — a 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C is required for this purpose — the display and keyboard function as an operator's I/O console to communicate with the operating system — the Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4331 Processor hardware system, and one displays messages unique to the 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C. The console address is selected at system installation time from the range 009 through 01F.

The console functions in one of two modes: "Display Mode" or the "Printer-KeyBoard Mode". In the "Printer-KeyBoard Mode", the Display Console uses the keyboard for input and the display and a 3287 Printer Model 1 or 2, and 3268 Printer Model 2 for output. The CRT, keyboard and printer appear to the system as a 1052 Printer/Keyboard and operate compatibly with S/360 console operations or as a 3210/3215 Console Printer-KeyBoard and operate compatibly with S/370 Console operations. The operation of the 3287 /3268 printer in this mode is optional, but recommended.

(Japan only > Printer keyboard mode is not available together with the Katakana language option for the operator console or for 3178, 3179 Color Display, 3180 Model 1, 3278 Display, 3268 or 3287 Printer attached to the Display/Printer Adapter. <)

In "Display Mode" the keyboard is used for input and the CRT with 20 lines by 80 characters/line is used for output. The 3287 Models 1, 2, 1C or 2C, and 3268 Model 2 or 2C if attached, has its own address and must be supported by either the 3277 Console Support of DOS/VS Release 34, the 3277 Console Support of DOS/VSE and SSX/VSE, the Multiple Console Support of OS/VS1, the local-attached 3286/3287 /3268 Printer support of VM/370, or the equivalent of any of these.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

Byte Multiplexer Channel (Optional): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and "Table 3" below for details. The channel permits simultaneous operations of low speed devices. Operates at up to 18K bytes per second (Model Group 1) or at up to 36K bytes per second Model (Group 2) in single byte mode. Up to 500K bytes per second in burst mode. See "IBM 4331 Channel Characteristics", GA33-1527 for 4331 Model Group 1 or GA33-1535 for 4331 Model Group 2, for devices which may attach and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0.

Subchannels: The 4331 Model Group 1 Byte Multiplexer Channel (#5248) provides up to 31 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of subchannels is reduced from 31 with the addition of certain special features:

Feature	Subchannels Unavailable
DASD Adapter (#3201)	2
8809 Magnetic Tape Unit Adapter (#4910)	2
Block Multiplexer Channel (#1421)	1
Communications Adapter (#1601)	1
Each telecommunication line on the Communications Adapter (#1601)	1

The 4331 Model Group 2 byte Multiplexer Channel (#5248) provides up to 36 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 36 subchannels is reduced by one if the Communications Adapter (#1601) is installed, and one for each telecommunication line on the Communications Adapter.

Block Multiplexer Channel (Optional): Each provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and "Table 3" below for details. The Block Multiplexer Channel permits simultaneous operation of high-speed devices. Ability to "Block Multiplex" and facility for multiple requesting allows several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. 33XX devices (and the 3830 or 3880 storage control units) do not attach.

- 4331 Model Group 1: One channel is optional. Data rate is up to 0.5 million bytes per second -- see IBM 4331 Model Group 1 Channel Characteristics, GA33-1527, for details. Standard channel address is 1, a different address may be selected at installation time from the range of 1 to 6.
- 4331 Model Group 2: Two channels are optional. Data rate is up to 1.25 million bytes per second -- see "IBM 4331 Model

Group 2 Channel Characteristics", GA33-1535, for details. If installed together with High-Speed Block Multiplexer Channel, the data rate of the Block Multiplexer Channel, Add'1 (#1422) is up to 0.6 million bytes per second. Channel addresses may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

- up to 128 non-shared subchannels and
- up to 16 shared subchannels, each with devices in multiples of 8, up to a total of 128 devices

High-Speed Block Multiplexer Channel (Optional): One channel is optional on 4331 Model Group 2 only. High data rate (up to 1.86Mb/sec) allows attachment of high-speed I/O devices including 2311/2314/2319, 3330/3333/3340/3344, 3350, 3370 via control units. Ability to "Block Multiplex" and facility for Multiple Requesting allows several I/O units to operate concurrently with greater channel efficiency. Can operate in Data Streaming Mode, which allows increased interface cable length and allows attachment of a control unit, e.g., a 3880, operating in Data Streaming Mode. The 3380 is not supported on the 4331. Devices attached which cannot utilize block multiplexing will function as if attached to a Selector Channel. Eight control unit positions are available. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and Table 3 for details. The channel address is selected at installation time from the range of 1 to 6.

Subchannels: Same as the Block Multiplexer Channel.

Native I/O Adapters: The following I/O adapters control the designated I/O devices:

DASD Adapter
5424 Adapter
Loop Adapter
8809 Magnetic Tape Unit Adapter
Display/Printer Adapter
Communications Adapter

Note: All data passing through the system for any I/O device interfaces with the data flow for other devices, producing I/O limitations. The limitations take two forms:

- Hardware exclusives listed in the sales manual.
- I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:

- The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
- The number and speed of lines attached to the Communications Adapter.
- The number and class of overrunnable devices on the Byte Multiplexer Channel.
- The number and traffic on 3178, 3179, 3180 Model 1, 3278 Model 2 or 3279 Model 2A or 02X or 5150/5160 PC with 3278/3279 Emulation Adapter attached to the Display/Printer Adapter.

It is necessary to consult the "IBM 4331 Channel Characteristics Manual", GA33-1527, for 4331 Model Group 1 or GA33-1535, for 4331 Model Group 2 to properly configure a 4331 with an I/O configuration that has not previously been analyzed.

DASD Adapter (Optional): One DASD Adapter is optional on the 4331 Model Group 1, one or two are available on the 4331 Model Group 2. Attaches 3310, 3370 A1/A2 and/or 3340/3344 Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 normally operate in fixed block mode where optimum DASD and system performance is achieved. If 3370 Model 2 attaches to the DASD Adapter, DASD Count-Key-Data (CKD) emulation is not provided.

As a transition aid and to allow the use of operating systems and programs which require Count-Key-Data (CKD) direct access storage, the 3340/3344 Direct Attachment and Direct Access Storage (DAS) Compatibility for emulation of 231X on 3310 or 3370 and 3330/3340 on 3370 are available. Operation with DAS Compatibility or the 3340/3344 Direct Attachment features in general will not achieve the same performance as the equivalent devices when attached to S/370 or 4300 processor channels. See performance notes included with the feature descriptions.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344 is limited to the static assignment of a shared string to one processor at a time.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	01	02	03	04	05	06	07
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F

and

X10	11	12	13	14	15	16	17
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

With a direct-attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a S/3 Model 12 or 15; this is a read-only mode and is available as a conversion aid for users converting to the 4331 Processors from a System/3.

The Direct Access Storage Compatibility feature provides emulation of 231X, 3330 (100Mb/volume) or 3340 data formats on the 3370 Model A1 and B1 Direct Access Storage and the emulation of 231X data formats on the 3310 Direct Access Storage. For address assignment of emulated volumes refer to "IBM 4331 Processor Compatibility Features", GA33-1528.

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C and up to seven (or 15 with optional feature, see below) additional devices chosen from the list below:

- 3178 Display Station
- 3179 Color Display Station (base color)
- 3180 Model 1 Display Station(2)
- 3191 Model A1X, B1X, D1X
- 3262 Line Printer Model 1 and 11 (650 and 325 lpm)
- 3268 Printer Model 2 and 2C (340 cps)(1)
- 3278 Display Station Model 2
- (Canada only > 3270 Personal Computer - Control unit terminal mode only(3) <)
- 3279 Color Display Station Model 2A or 02X
- 3287 Printer Models 1, 2, 1C and 2C (80 and 120 cps)
- 3289 Printer Model 4 (400 lpm)
- 4224 Printer Models 2XX (200/400 cps) (Non-IPDS Mode)
- 4234 Model 1 Dot Band Printer (300 lpm)
- 4250 Printer
- Personal Computer XT/370 (5160 Model 589) (Control Unit Terminal Mode only) ***
- Personal Computer AT/370 (5170 Model 599 and 739) (Control Unit Terminal Mode only) ***
- 5150 attached to 3278/3279
- 5150/5160/5170 PC with 3278/3279 Emulation Adapter
- 5160 with XT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) ***

- 5170 with AT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) ***
- 5210 printer Models G01, G02
- 6580 Displaywriter System, Model A04, A06, A08, A10 (25-line display)

Notes:

1. Specify #9841 in 4331 must be ordered for attachment of 3268 to the 4331 Model Group 1. Provides microcode and/or the maintenance documentation if machine is below EC 366585 (microcode for 4331 Model Group 1) or below EC 366586 (microcode for 4331 Model Group 2, 11) and/or below EC 366584 (maintenance document) for all Models.
2. The 3180-1 is supported only when it is emulating a 3278 Model 2. The 3180 extended functions or larger screen formats are not supported.
3. Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer and Personal Computers AT/370 and XT/370.

These machines may be installed in any combination, provided that (1) only seven (or 15 with optional feature) devices are installed and (2) no more than two system printers (3262 and/or 3289) are included. Due to the processing power of the 4250, it is not practical to attach more than two on Model 1 or more than four on Model 2, see "Specify". The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The file transfer function from Personal Computer to host and the screen capture function to the PC printer or diskette are not supported on the Personal Computer attached to the 3278/3279 if connected to the Display Printer Adapter.

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287 /3268/4224/4234 Printer may be used as a console hardcopy device; one or more 3287 /3268/4234 printers may be used as hardcopy workstation devices; one or more 5210s may be used as high quality printers in 3287 mode only. The 3178, 3179 Color Display Station (base color), 3180 Model 1, 3278 Display Station Model 2, (Canada only > 3270 Personal Computer - Control Unit Terminal Mode only**, <) or 3279 Color Display Station Model 2A or 02X may be used as additional operator's consoles with the presence of OS/VS1 Multiple Console Support or equivalent, or as workstations for user-written applications. The 6580 Displaywriter System emulates a 3278-2 Display Station, and, optionally, a 3287-1/2 Printer. The 6580 may be used as a workstation for user-written applications and for hard copy, as a 3278-2 and 3287-1/2. Display/Printer Adapter support includes all standard functions of the 3274 Model X1B with the 3178, 3179, 3180 Model 1. 3278 Model 2, (Canada only > 3270 Personal Computer - Control Unit Terminal Mode only**, <) or 3279 Model 2A or 02X or 5150/5160 PC with 3278/3279 Emulation Adapter attached. In addition, the following 3180 Model 1, 3278 Model 2 or 3279 Model 2A or 02X special features are supported: Keyboard Numeric Lock (standard on the 3178, 3179, or 3180 Model 1), Audible Alarm (standard on the 3178, 3179, 3180 Model 1 or 3279), Security Keylock (standard on the 3180 Model 1), and Switched Control Unit (Switch Control Unit as an accessory on 3179 and 3180 Model 1). Other 3180 Model 1, 3278 Model 2 or 3279 Model 2A or 02X special features are not supported. When used as workstations, 3180 Model 1 display station keyboard, feature codes #4600 or #4601 may be selected; or on the 3278 or 3279 Display Station keyboard feature codes #2715, #2716, #2717, #4621, #4622, #4623, #4627 may be selected. If two different keyboards are required for a workstation, one must be (Japan only > #2715 or <) #4621. Addresses for these devices are selected at installation time from the range 009 through 01F.

** Specify #9843 on 4331 must be ordered for attachment of the 3270 Personal Computer or Personal Computers XT/370 and AT/370.

Only two language/keyboard combinations may be installed on the Display/Printer Adapter or the Display/Printer Adapter Expansion (#2001). Language(s) supported and keyboard(s) to be attached must be specified at order entry-time or via MES, see "Specify" below. (Japan only > If a Katakana operator console is installed, the 3278 Model 2 or 3279 Model 02X Display Stations with Katakana installed on the Display/Printer Adapter must have typewriter keyboard #2715 or #2717. <)

The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (#8332) and specify #9842 in 4331 must be ordered for attachment of Displaywriter.

Specify #9843 must be ordered for attachment of the 5150/5160 PC with 3278/3279 Emulation Adapter.

Display/Printer Adapter Expansion (Optional): Expands the capability of the standard Display/Printer Adapter to permit the 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C and up to 15 displays and/or printers to directly attach to the 4331 Processor. All other capabilities and limitations are listed under Display/Printer Adapter (Standard) above.

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4331 Processor. This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below) or a data capacity of 246,272 bytes organized in 1,924 sectors of 128 bytes each (for use in exchanging data with another 4331 Processor). Each Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with DOS/VSE or DOS/VS POWER refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and Series/1 and Systems/3, 32, 34, and 38. One diskette is shipped with the feature. Device address is selected at installation time from the range 009 through 01F.

5424 Adapter (Optional): Provides native attachment of 5424 Multi-Function Card Unit Models A1 or A2 (Models K1, K2, K3 are available in Japan only) for 96-column card operations -- Device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4331 Model Groups 1 and 2 is a native attachment method for the 3640 Plant Data Communications Terminals -- 3104 Display Terminal Models B1, B2 -- 8775 Display Terminal Models 1 and 2 -- 3232 Keyboard Printer -- 3287 Printer -- 3274 Control Unit Model 51C, 61C, 52C -- 3276 Control Unit Display Station with their associated terminals -- 7426 Terminal Interface Unit Model 1 with its associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexibility.

A maximum of two direct-attached loops and two data link adapters are supported. Each of the direct-attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore, lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one 3843 Loop Control Unit as point-to-point or up to 4 Loop Control Units as multipoint configuration. Details on programming information are provided in the "IBM 4331 Loop Adapter Programming Guide", SC31-0500-0.

User-written programs for loop-attached terminals reside in the 4331 Processor storage and are controlled by VSE and ACF/VTAME or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition, IBM offers a PRPQ to CICS/VS (announced December 23, 1980). This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4331 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

- Terminal initialization
- Terminal re-initialization
- 3642 encode check handling

● Transaction selection

Communications network management problem determination support for 4331 loop-attached 3104 Display Terminals, 8775 Display Terminals, 3232 Keyboard Printer Model 11, 3276 Display Control Stations and 3274 Model 51C, 61C, 52C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal Models 1, 2 -- 3642 Encoder Printer Models 1, 2 -- 3643 Keyboard Display Model 2, 3, 4 including 4920 Badge and Document Encoder -- 3644 Automatic Data Unit -- 3645 Printer -- 3646 Scanner Control Unit -- 3647 Time and Attendance Terminal -- 3104 Display Terminal Models B1, B2 -- 8775 Display Terminal Models 1, 2 -- 3232 Keyboard Printer Model 11 -- 3287 Printer Models 11, 12 -- 3274 Control Unit Model 51C, 61C, 52C -- 3276 Control Unit Display Station Models 11-14 with their associated terminals -- 3843 Loop Control Unit -- 7426 Terminal Interface Unit Model 1 with its associated terminals. Device addresses are 040 through 07E.

8809 Magnetic Tape Unit Adapter (Optional): Provides native attachment of 8809 Model 1A and up to five additional 8809 tape units (consisting of a mix of 8809 Model 2s and 3s) -- allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for loading or off-loading DASD devices or in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read Backward commands are not supported, the Read Backward operation is simulated in the Logical IOCS (MTMOD) of DOS/VSE. Standard channel address is 3. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

Communications Adapter (Optional): The 4331 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocall unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit-terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For further details, refer to "Special Features".

IBM Stand-Alone Modems

Modems	Speed (bps)	Lines
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw
3864-1,2	4800/2400	Nonsw
3865-1,2	9600/4800	Nonsw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3868-3,4	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw
3874	4800/2400	Nonsw
3875	3600/7200	Nonsw
5811-10	2400 to 19200	Limited distance modem
5811-18		Rack mount ver- sion of Model 10
5811-20	2400 to 19200	Nonsw baseband
5811-28		Rack mount ver-

5812-10	2400 to 19200	sion of Model 20
5812-18		Nonsw baseband Rack mount version of Model 10
5865-2,3	9600/7200/4800	Nonsw voice grade Rack mount version of 5865-2
5868-52		Nonsw voice grade Rack mount version of 5866-1,2
5866-2,3	14400/9600	
5868-62		

(Canada only>The following modems are supported with the Switched Network Back-up feature -- see M3863, 3864, 3865, 3872, 5865 and 5866 pages for details:

Modems	Speed (bps)	Lines
3863-1,2	2400/1200	Nonsw voice grade
3864-1,2	4800/2400	Nonsw voice grade
3865-1,2	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw voice grade
5865-2,3	9600/7200/4800	Nonsw voice grade
5866-2,3	14400/9600	Nonsw voice grade

Note: 2- and 4-wire SNBU are supported by 5865 and 5866 modems.<)

IBM Integrated Modem (V.23, 1200 bps): The following integrated modem configurations are available:

- Switched network with auto answer
- Nonswitched line, 2- or 4-wire
- (Canada only>Nonswitched line with switched network backup and auto answer
- Nonswitched line with switched network backup with manual answer<)

OEM Modems: OEM modems that comply with EIA RS-232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

PTT-Mandatory Modems: The Communications Adapter will support the mandatory modems which the PTTs in various WT countries provide for attaching Data Terminal Equipment (DTE), such as the Communications Adapter, to their facilities. See M2700 pages

X.21 Adapter for Nonswitched Networks: The X.21 interface allows attachment to the X.21 facilities available in certain countries by way of an internal X.21 adapter.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- The Communications Adapter will support mandatory autocal Units which the PTTs in various WT countries provide in accordance with CCITT V.25. See Autocall Unit Interface (#1020) for specifics.
- Other Automatic Calling Equipment which complies with EIA RS-366 or CCITT V.25 may be connected to the Autocall Unit Interface (#1020) under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Power (1-phase, 3-wire, 60 Hz): #9902 for 208V, #9914 for 240V, #2732 for 200V, 2803 for 220V.

(1-phase, 3-wire, 50 Hz): #2813 for 220V, #2801 for 240V, #2806 for 200V, #2821 for 230V. (Meets Japanese Current Leakage Requirements.)

- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.
- Machine Nomenclature: National safety regulations require maintenance labels in local language. The language is determined by default from the 3-digit country code in the machine order. If the installation country is different from the order country specify #2900 which provides sets of labels in other languages. The IBM CE selects and installs the appropriate one. (Canada only>In Quebec: Specify #2935 for Canadian French #2934 for English.<)
- Specify #9260 for 4250 attachment and #9841 for 3268 or 4234 Model 1 attachment.
- Specify #9843 must be ordered for attachment of 5150/5160 PC with 3278/3279 Emulation Adapter and Personal Computer XT/370 and AT/370.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4331 Processor. It provides service personnel the capability of remotely controlling the 4331 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on ordering and customer responsibilities, see "Systems and Procedure Manual".

(Australia and Brazil only>When specified, each 4331 Processor will be equipped with either a CCITT interface or 1200 bps Integrated Modem (switched network, manual answering) for RSF.

1. Specify #2838 for CCITT interface.
2. Specify #2836 for 1200 bps Integrated Modem, switched network, manual answer.<)

(Canada only>Specify #9510 for Remote Support Facility via a 1200 bps integrated modem, switched network, manual answer.<)

(Japan only>Each 4331 Processor will be equipped with either a CCITT interface or 1200 bps Integrated Modem, non-switched.

1. Specify #2838 for acoustic coupler interface.
2. Specify 2944 for 1200 bps Integrated Modem, non-switched. Also specify #2943 for the NTTCA-2 modem service cable connector.<)

(All other countries>Consult your country's DPCE department.<)

- Remote Operator Console Facility (ROCF): This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4331 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4331 are suppressed when ROCF is in use.

* 3275 Model 2 can only be obtained on an as available basis.

(Except Canada, Hong Kong>Specify ROCF feature #2838 for CCITT V.23/V.24/V.28 Interface. The requisite customer-supplied or PTT-mandatory non-clocked external modem attached to feature #2838 must include auto answer. Line discipline is BSC, 600 or 1200 bps.

Notes: Katakana is not supported for 3275 Model 2 as the remote console. Katakana is supported only by the VM/Pass-Through Facility Program Product.<) (Canada only> Specify ROCF feature #9511 for EIA-Interface. The requisite customer-supplied non-clocked WE 202S equivalent external modem attached to feature #9511 must include auto answer. Line discipline is BSC, 600 or 1200 bps.<) (Hong Kong only> Specify #2838 for CCITT V.23/V.24/V.28 Interface and #2839. The requisite customer-supplied or PTT-mandatory non-clocked external modem must include auto answer. Line discipline is BSC, 600 or 1200 bps.<)

- Loop-Attached Terminals: The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274-51C, 52C, 61C and/or 3276 Control Units are attached to the system via Loop Adapter 1 and/or 2 (#4830, #4831) and/or Data Link Adapters (#4840).

- #9251 3641 Reporting Terminal/3647 Time and Attendance Terminal
- #9252 3642 Encoder Printer
- #9253 3643 Keyboard Display
- #9254 3644 Automatic Data Unit (ADU)
- #9256 3646 Scanner Control Unit
- #9257 8775 Display Terminal 3287/3645 Printer 3274-51C, 52C, 61C and 3276 Control Unit and 3104 Display Terminal
- #9258 3643 Keyboard Display with #4920

- Keyboard/Character Set Language: Must be specified on the 4331 for 3178, 3179, 3180, 3191 Model A1X, B1X, 3192 Model C3X, D3X, F3X, 3278, 3279, 3287, 4234 devices attached to the Display/Printer Adapter and for 3641, 3642, 3643 devices attached to the Loop/Data Link Adapter. It must correspond to the Keyboard/Character Set Language ordered for the device.

- Specify language from Table 5 Column A. This language is mandatory for the 3278 Model 2A or the 3279 Model 2C and can be used for 3178 Model C2, 3179, 3180 Model 1, 3278 Model 2, 3191 Model A1X, B1X or 3279 Model 02X with typewriter keyboards and 3287 printers.
- For attachment of 3178 Model 1C, 3180 Model 1, 3278 Model 2 with Data Entry Keyboards, select one language from Table 5 Column B and specify one of the mutually exclusive keyboard types. #9301 for Data Entry, 3180 Model 1 with #4601, 3178 Model 1C with #4622, #2716, or #9302 for Data Entry, keypunch-layout (#4623).

Note: 3178 Model C1K cannot be used and Data Entry Keyboard cannot be specified for 3180 Model 1, 3278 Model 2 or 3279 Model 02X display workstations if Katakana is to be used on both the operator console and the workstations.

- If alternate language for 3178 Model 2C, 3179, 3180 Model 1, 3278 Model 2 or 3279 Model 02X with typewriter keyboard is required, specify language from Table 5 Column B and keyboard type as follows: #9303 for typewriter keyboard 3178 Model 2C #2715, #2717, #4621, #4627.

Note: 3178 Model C1, 3180 Model 1, 3278 Model 2 or 3279 Model 02X with Data Entry Keyboard cannot be attached in this case.

- For 3641/3642/3643 devices US English #2956 is automatically supplied. In addition, one alternate language can be selected from Table 5, column B. It must correspond to the alternate language which may have been specified for 3178/3179/3180/3278/3279/3287 devices. As an exception, #2930 US Keyboard/Katakana Display, not available for 3178/3179/3180/3278/3279, may be specified for 3643 in addition to the alternate language for 3178/3179/3180/3278/3279/3287.

Table 5 - Keyboard Language/Character Set Language

A	B
Mandatory	Alt Lang

and/or
K/B Type

International	#0950	#2950
US	#0956	#2956 (1)
EBCDIC	#0951	#2951
Brazil	#0975	#2975
Spain	--	#2960 (5)
Span Speaking	#0969	#2969 (2)
Japanese Eng	#0955	#2955
Katakana	#0973 (3)	#2973
US Keyboard,	--	#2930 (6)
Katakana Display		
Canadian French	#0956 (4)	#2977

Notes:

- Automatically supplied for 3641/3642/3643 devices.
- Not available for 3642. Spain #2960 will be supplied.
- (Japan only> For Katakana specify #0973 on 4331, and #2720 and #2773 on the 3278 Model 2A or the 3279 Model 2C.<)
- For Canadian French, specify on the 4331 US #0956. For the 3278 Model 2A or 3279 Model 2C, Canadian French Keyboard Language (#2977) must be specified.
- Not available for 3278/3279/3287 and 3641/3643 devices. This character set is used for 3642 when Spanish Speaking is specified.
- Only available for 3643.

(Canada only> Specify #9843 on 4331 must be ordered for attachment of the 3270 Personal Computer and Personal Computer XT/370 and AT/370.<)

- For 3641/3642/3643 devices US English #2956 is automatically supplied.
- Console Table: A console table is available -- see #1550 or "Accessories" section for details. Book Rack and Cable Holder -- see #1480 or "Accessories" section.
- See 3278 Display Console Model 2A or 3279 Color Display Console Model 2C for console cabling.

#9842 - For attachment of 6580 Displaywriter System to the Display/Printer Adapter (ordered on the 4331 only, not on the Displaywriter).

SPECIAL FEATURES

Legend:

%x: Feature supplies diskette for System Diskette facility.

%z: System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter (#1601) (when more than three line features are attached), and the Adapter Logic. Maximum: One. Field Installation: Yes. Prerequisites: #1002, or for the Loop Adapter (#4830) and/or #1601 with more than three line attachments #4695 and/or #4696.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). Maximum: One. Field Installation: Yes. Prerequisites: #1001.

Block Multiplexer Channel (#1421), Add'l (Model Group 2) (#1422): Each provides means of attaching I/O devices. Up to eight control units may attach to each channel. Disconnect during command chaining allows multiple I/O devices to operate concurrently. The 3830 and 3880 Control Units with associated DASD do not attach.

See DASD Adapter (#3201, #3202) for attachment of 3340/3344/3310/3370 devices.

4331 Model Group 1: Data transfer rates up to 0.5 million bytes per second.

4331 Model Group 2: Data transfer rates up to 1.25 million bytes per second each.

If High-Speed Block Multiplexer Channel is installed, the data rate is up to 0.6 million bytes per second for the Block Multiplexer Channel, Add'l (#1422). See "Input/Output Attachment" section above for details on subchannels. Limitations: (1) 231X can only be installed on Block Multiplexer Channel #1421, not on #1422. (2) 231X devices cannot operate with any telecommunication line feature on the Communications Adapter which operates at a speed greater than 9600 bps (#4720). On 4331 Model Group 1 only: (3) Block Multiplexer Channel, Add'l (#1422) is not available. (4) 231X devices may not be installed with any of the following: 3370s on the DASD Adapter (#3201, #3202), 3340/3344 Direct Attachment (#7851), 8809 Magnetic Tape Unit Adapter (#4910), Magnetic Tape Units attached to the Byte Multiplexer Channel (#5248). On 4331 Model Group 2: (5) Block Multiplexer Channel, Add'l (#1422) not be installed with 8809 Magnetic Tape Unit Adapter (#4910). (6) 231X devices cannot be installed on the Block Multiplexer Channel (#1421) if High-Speed Block Multiplexer Channel (#1431) is installed. Maximum: #1421 one, #1422 one (Model Group 2). Field Installation: Yes. Prerequisites: #1422 requires #1421. For certain control units/devices the processor requires Power Interface feature (#5531, #5532). See Table 3.

High-Speed Block Multiplexer Channel (#1431): (Model Group 2) Provides attachment of high-speed I/O devices including 3330/3333, 3340/3344, 3350, 3370 A1 via control units including 3830 Model 2 and 3880. The control unit can operate in Data Stream Mode. Up to eight control units may attach. Data transfer rate up to 1.86 million bytes per second. (See "Input/Output Attachment" section above for specifics). Limitations: (1) Not available on 4331 Model Group 1. (2) For data rate and attachment limitations for other devices and communications lines refer to "IBM 4331 Processor Channel Characteristics", GA33-1535 (Model Group 2), which contains tables of pre-analyzed configurations. (3) Cannot be installed with 8809 Magnetic Tape Unit Adapter (#4910). (4) 231X devices must be attached to the High-Speed Block Multiplexer Channel and cannot be used on the Block Multiplexer Channel (#1421). (5) Is mutually exclusive with DASD Adapter, Add'l (#3202). Maximum: One. Field Installation: Yes. Prerequisites: For certain control units/devices, the processor requires Power Interface feature (#5531, #5532). See Table 3.

Control Storage Expansion (#1901): (Model Group 1) Increases the Control Storage capacity of the Model Group 1 from 65,536 to 131,072 bytes, providing additional storage area for special features and the basic functions of the 4331 Processor. See Tables 1 and 2 to determine the requirement for this feature. Limitations: Not available on 4331 Model Group 2 (expanded control storage is standard). If installed on Model Group 1, this feature should be deleted with the order entry for conversion to Model Group 2. Maximum: One. Field Installation: Yes. Note: This is for order entry only. The feature is not physically removed when upgrading to a Model Group 2.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, and to determine when Control Storage Expansion (#1901) is required, use the following procedure. Note: An interactive HONE aid is available dependent on the control program or program product device support to facilitate this procedure.

- Consulting Table 1, determine the microcode groups required to support the features and I/O to be installed.

- On Table 2, place a check mark in the appropriate rows. Note that each microcode group is required only once, even if it supports multiple functions of the 4331 Processor. The only exception to this is microcode group 2 where 2,048 bytes of Processor Storage are required per megabyte of virtual storage defined in the notes.
- Find the sum of each of the three columns for the required microcode groups.
- The total from Column A and B must pass three tests.
 - When the total from Column A exceeds 65,536 bytes, Control Storage Expansion (#1901) is required (4331 Model Group 1).
 - When the total from Column A exceeds 131,072 bytes for a Model Group 1 or 143,360 bytes for a Model Group 2, an invalid configuration has been selected (see Note below).
 - When the total from Column A plus the total from Column B exceeds 262,144 bytes, an invalid configuration has been selected (see Note).
- Subtract the total from Column A from either:
 - 131,072 if #1901 is required (4331 Model Group 1), or
 - 65,536 if #1901 is not required (4331 Model Group 1).
 - 143,360 if 4331 Model Group 2 is being configured.
- Subtract the results of Step 5 from the total of Column B.
- Add the results of Step 6 to the total from Column C and round up to the next multiple of 4,096.

The results of Step 7 determine the amount of Processor Storage occupied by microcode and should be subtracted from the Processor Storage size ordered to determine the amount available for the user. The storage for Group 9 (DAS Compatibility #7901) is only occupied if the feature is activated at IPL time.

Note: Too many features/options have been selected. Inspect Table 1 and 2 and determine which feature(s) of lower priority should be deleted from the configuration.

Table 1 - Microcode Groups

Function/Feature Installed	Micro-code Group
4331 Processor	1
Processor Storage	2
3310 attached (#3201 and #9202)	3,4,5,6
3370 attached (#3201 and #9201)	3,4,6,17
3340/3344 Direct Attach (#3201 and #7851)	3,6,8,15
Direct Access Storage Compatibility (#7901)	9,15
8809 Magnetic Tape Unit attached (#4910)	3,4,6,7

Display/Printer Adapter Expansion (#2001): Expands the capability of the standard Display/Printer Adapter to allow the 3278 Model 2A or the 3279 Model 2C and up to 15 displays and/or printers to directly attach to the 4331 Processor. The devices attachable are:

- Up to 15 3178 Display Stations
- Up to 15 3179 Color Display Stations
- Up to 15 3191 Model A1X, B1X, D1X, D3X Display Stations
- Up to 15 3192 Model C1X, C3X, D1X, D3X, F1X, F3X Display Stations
- Up to 15 3180 Model 1 Display Stations (Canada only > Up to 15 3270-PCs <)
- Up to 15 3278 Display Station Model 2s
- Up to 15 3279 Color Display Station Model 2A or 02X
- Up to 15 3268 Printers Model 2
- Up to 15 3287 Printer Models 1, 2, 1C and 2C
- Up to 2 3289 Line Printer Model 4s
- Up to 2 3262 Line Printer Model 1s and 11s
- Up to 15 4234 Printer Model 1s
- Up to 2 4250 Printers Model 1 or four Model 2s
- Up to 15 5150/5160/5170 PCs with 3278/3279 Emulation Adapter
- Up to 15 5210 printer Models G01, G02
- 6580 Displaywriter System Model A04, A06, A08, A10 (25-line display). Can connect to 1 or 2 device ports (display station or display station and printer).

Other details are the same as given under the description of the Standard Function: Display/Printer Adapter, above. Limitations: Only the 3278 Model 2A or the 3279 Model 2C and 15 devices (listed above) may attach to the Display/Printer Adapter and the Display/Printer Adapter Expansion. Maximum: One. Cable Order: See "Accessories" for ordering information for the required coaxial cable. Field Installation: Yes. Specify: See "Specify" for language/keyboard combinations available. Prerequisites: The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (#8332) and Specify #9842 in 4331 must be ordered for attachment of Displaywriter.

DASD Adapter (#3201%x), Add'l (4331 Model Group 2) (#3202%x): Each allows attachment of the 3310, 3370 A1 (Models A2/B2 for 4331 Model Group 2) and 3340/3344 DASD to the 4331 Processor. Up to four strings of devices may be attached to each adapter. The attachable device types may be intermixed on each adapter but not within a string. The maximum number of strings of each type of device on each DASD Adapter is:

- Up to four 3310 Model A1s or A2s with 3310 Model B units attached, up to a maximum of 4 drives per string.
- Up to four 3370 Model A1s with 3370 Model B1 units attached, up to a maximum of 4 devices (8 actuators) per string. Up to four 3370 Model A1/A2s with 3370 Model B1/B2 units attached, up to a maximum of 4 devices (8 actuators) per string for 4331 Model group 2. Intermix of 3370 Models 1 and 2 on strings and within a string is supported.
- Up to two 3340 Model A2s with 3340/3344 Model B units attached, up to a maximum of eight drives per string - (3340/3344 Direct Attach feature #7851 is required). Attachment of 3340/3344 is limited to two strings on the system.

String Switch Capability allows sharing of 3340 Model A2 and/or 3370 Model A1/A2 and associated drives with another IBM

processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340 Model A2 or 3370 Model A1/A2 must have the String Switch feature #8150 installed. String switch support for 3340/3344 is limited to the static assignment of a shared string to one processor at a time. Limitations: (1) DASD Adapter, Add'l (#3202) is not available for Model Group 1. (2) DASD Adapter, Add'l (#3202) is mutually exclusive with High-Speed Block Multiplexer Channel (#1431). (3) 3310 and 3370 are not supported by VS1 in fixed block mode. (4) For data rate and attachment limitations for other devices and communications lines refer to "IBM 4331 Processor Channel Characteristics", GA33-1527 (Model Group 1) or GA33-1535 (Model Group 2), which contains tables of pre-analyzed configurations. (5) On 4331 Model Group 1 only: 3340 or 3370 may not be attached to the DASD Adapter if 231X DASD is attached to the Block Multiplexer Channel (#1421, or #5655 with #9831). (6) on 4331 Model group 2 only: DASD CKD Emulation (#7901) is not provided if 3370 A2/B2 is installed. Maximum: One #3201 and one #3202 (on 4331 Model Group 2). Field Installation: Yes. Prerequisites: 3340/3344 requires #7851 -- see Table 1 for microcode storage requirements and possible requirement for #1901 on Model Group 1 -- #3202 requires #3201. Specify: #9202%z if 3310 and/or #9201%z if 3370 Model 1 and #9318%Z if a 3370 Model 2 (4331 Model group 2 only) attaches to the DASD Adapter. #9316 if String Switch Capability is required with 3370.

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. Limitations: Not supported by VM/370. Maximum: One. Field Installation: Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. Maximum: One. Cable Order: Required. Field Installation: Yes. Prerequisites: External Devices must meet the interface specifications outlined in "S/360 Direct Control Feature OEMI", GA22-6845.

5424 Adapter (#3901%z): Allows attachment of one 5424 Multi-Function Card Unit Model A1 or A2. (Japan only) Also allows attachment of one 5424 Model K1, K2 and K3. < Limitations: The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed with the Loop Adapter (#4830). Maximum: One. Field Installation: Yes. Prerequisites: #1001 and #1002.

1401/1440/1460 Compatibility (#3950%z): A feature which, in conjunction with special software, permits execution of 1401/1440/1460 instructions. Feature may be used with S/370 mode or with ECPS/VSE mode. See "Software" for details concerning prerequisites. Limitations: May not be installed with 8809 Magnetic Tape Unit Adapter (#4910). May not be installed with ECPS/VM/370 (#8701) and does not operate under VM/370. Support is available under DOS/VSE/Advanced Function, DOS/VS Release 34 and DOS Release 26. Maximum: One. Field Installation: Yes. Prerequisites: IBM Systems 1401/1440/1460 Emulator Program Product. See Programming pages for details. See Table 1 for microcode storage requirements and possible requirement for #1901.

8809 Magnetic Tape Unit Adapter (#4810%z): Provides for attachment of the 8809 Magnetic Tape Unit. One 8809 Model 1A may attach. Up to five 8809 Model 2s and 3s may attach to the Model 1A for a total of six 8809 Magnetic Tape Unit drives. Limitations: (1) May not be installed with 1401/1440/1460 Compatibility (#3950). (2) May not be installed with Block Multiplexer Channel, Add'l (#1422) on 4331 Model Group 2. (3) May not be installed on 4331 Model Group 1 if 231X devices are attached to the Block Multiplexer Channel (#1421). (4) May not be installed with High-Speed Block Multiplexer Channel (#1431) on 4331 Model Group 2. (5) The 8809 is not supported by VS1. Maximum: One. Field Installation: Yes. Prerequisites: See Table 1 for microcode storage requirements and possible requirement for #1901 on Model Group 1.

Byte Multiplexer Channel (#5248): The byte multiplexer channel attaches S/370 byte multiplex devices. The data rate of the channel is up to 18K bytes per second for Model Group 1 or up to 36K bytes

per second for Model Group 2 in single byte interleaved mode and up to 500K bytes per second in burst mode. For data rates achievable for specific configurations, see "IBM 4331 Channel Characteristics", GA33-1527 for Model Group 1 or GA33-1535 for Model Group 2. Up to eight control units may be attached. See "Input/Output Attachments" section above for details on subchannels. Limitations: (4331 Model Group 1) Magnetic tape devices may not be attached to the Byte Multiplexer Channel whenever 231X devices are attached to the Block Multiplexer Channel (#1421). Maximum: One. Field Installation: Yes. Prerequisites: For certain control units/devices, the processor requires Power Interface (#5531, #5532). See Table 3.

Power Interface (#5531), Add'l (#5532): Provides power control to the 4331 Processor for control units attaching to the 4331 Byte Multiplexer Channel and Block Multiplexer Channel. Table 3 lists the control units/devices for which this feature must be installed in the 4331 Processor -- Power Interface (#5531) allows attachment of up to eight of these control units; Power Interface, Add'l (#5532) allows attachment of eight additional control units for a maximum of 16 per processor. Maximum: One of #5531; one of #5532. Field Installation: Yes. Prerequisites: #5532 requires #5531.

Table 3 - Control Units/Devices Requiring Power Interface Features

Mandatory:

1255 Magnetic Character Reader
1270 Optical Reader Sorter
1275 Optical Reader Sorter
1287 Optical Reader
1288 Optical Reader
1419 Magnetic Character Reader
1442 Card Read Punch Model N1
1442 Card Punch Model N2
1443 Printer Model N1
2314 Storage Control* Model A1 and B1
2314 Direct Access Storage Facility* Model 1
2415 Magnetic Tape Unit and Control
2501 Card Reader Model B1 and B2
2520 Card Read Punch Model B1, B2 and B3
2701 Data Adapter Unit
2702 Transmission Control*
2703 Transmission Control*
2803 Tape Control
2821 Control Unit Models 1, 2, 3, 5 and 6
2822 Paper Tape Reader Control*
2840 Display Control*
2841 Storage Control
3272 Control Unit
3411 Magnetic Tape Unit and Control
3430 Magnetic Tape Unit and Control
3505 Card Reader
3540 Diskette Input/Output Unit
3704 Communications Controller
3705 Communications Controller
3725 Communication Controller
3791 Controller
3800 Printing Subsystem
3803 Tape Control
3811 Printer Control Unit
3881 Optical Mark Reader Model 1
3886 Optical Character Reader Model 1
3890 Document Processor
3895 Document Reader/Inscriber

Not Mandatory, but can utilize Power Interface features:

3274 Control Unit
3340 Direct Access Storage Facility
3370 Direct Access Storage
3203 Printer Model 5

* No longer available

3340/3344 Direct Attachment (#7851%z): A feature allowing 3340 Model A2s to attach to a DASD Adapter (#3201, #3202). Up to two 3340 Model A2s per system may attach to either adapter. Up to three 3340/3344 Model B units may attach to each 3340 Model A2.

S/3 Data Import: With the VSE/IBM System/3-3340 Data Import utility program (5746-AM3), 3348 Data Modules which have been written on a 3340 attached to a System/3 can be read on any direct-attached 3340 drive. The String Switch Capability allows sharing of 3340 Model A2 drives (with #8150 installed) and associated drives, with another IBM processor or control unit that supports the DASD and string switching. String switch support is limited to the static assignment of a shared string to one processor at a time. Limitations: (1) May not be installed if 231X devices attach to the Block Multiplexer Channel (#1421). (2) Attachment of 3340/3344 and/or use of the DAS Compatibility is limited to two strings on the system. (3) If one string of 3340/3344s is attached to a DASD Adapter (#3201), only one string of 3310/3370s can perform DASD emulation. If two strings of 3340/3344s are attached, no 3310/3370s can perform DASD emulation. Maximum: One. Field Installation: Yes. Prerequisites: #3201 -- 3340 Model A2. See Table 1 for microcode storage requirements and possible requirement for #1901. Specify: #9315 if String Switch Capability for 3340 required, #9317 if 3344 is installed.

Use of this feature introduces additional processor and channel demands, and can have a significant effect on system performance, particularly in batch environments with heavy I/O load and/or if multi-track operations are used. Performance considerations should be carefully reviewed before proposing use of the 3340/3344.

Direct Access Storage Compatibility (#7901%z): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100Mb/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 mode under DOS, DOS/VSE, OS/VS1 or VM/370, in ECPS:VSE mode under DOS/VSE. Under DOS/VSE data sets in fixed block format and in emulated format can co-reside on the same 3310/3370 volume. With DOS/VSE a variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With OS/VS1 or VM/370 partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Maximum Number of Emulated Full Volumes:

Compatibility Type	Per Host	Per Vol.	Per String	Per System
2311 on 3310	7		28	56
2314 on 3310	2		8	16
2311 on 3370	34		68	68
2314 on 3370	9		63	63
3330 on 3370	2		16	28
3340 on 3370	3		24	42

For device address assignment refer to "IBM 4331 Compatibility Features", GA33-1528.

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE or VM/370 but not with OS/VS1. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: (1) Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. (2) Operation of emulation and direct-attached 3340/3344 is limited to two strings on the system. (3) One type of emulation can be activated at IPL time. (4) 3330 Model 11 cannot be emulated. (5) Emulation cannot be used on 3370 drives which are shared via a string switch. (6) VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370. (7) OS/VS1 does not support 2311, native or emulated. (8) On 4331 Model group 2 only: DASD Count-Key-Data (CKD) emulation is not provided if 3370 Model 2 is installed. Program Order: The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, 5745-030 or combined with VSE/Advanced Functions, 5746-XE9. OS/VS1 (5741-VS1) and VM/370 (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. Maximum: One. Field Installation: Yes. Prerequisites: #3201 with 3370 (#9201) and/or 3310 (#9202) specification. See Tables 1 and 2 for microcode storage requirements.

ECPS:VM/370 (#8701%z): The 4331 Processor provides ECPS:VM/370 support at Level 19. This support is compatible with VM/370 Release 6 and VM/System Product or VM/BSE Release 2 or VM/SE Release 2 corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction Emulation and Virtual Interval Timer. Limitations: May only operate when S/370 mode has been invoked by IPL. May not be installed with 1401/1440/1460 Compatibility (#3950). Maximum: One. Field Installation: Yes. Prerequisites: See Table 1 for microcode storage requirements and possible requirement for Control Storage Expansion (#1901).

COMMUNICATIONS AND LOOPS

Communications Adapter: Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1527 for Model Group 1 or GA33-1535 for Model Group 2. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 64,000 bps and may operate concurrently with other lines provided that its data rate does not exceed 50,000 bps and the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/370. Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to 8 line features without internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) with clock.
- Up to 8 line features with internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) without clock.
- Up to 1 synchronous high-speed line feature.
- Up to 8 line features with integrated modems.
- Up to 8 line features with local attachments.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-KeyBoard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half-speed operation for synchronous lines only (for both clocked and non-clocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the CE:

- Duplex instead of half-duplex connection (two-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High-speed operation for one line (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

TERMINALS SUPPORTED

The Data Communications Equipment and remotely attachable Data Terminal Equipment (abbreviated "terminals") supported by the Communications Adapter are shown in the table below:

SDLC Terminals Supported:

Type	Speed in K bps
4.8-----	-----4.8/2.4
2.4/1.2----	-----7.2
2.4-----	-----7.2/3.6
1.2/.6-----	-----9.6
	-----20.4-64
v v v v v	v v v v v

Terminals:

Notes:

1. 3705 or 3725 supported as a primary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
2. Participant as a primary or a secondary station in a network using ACF/VTAME.
3. Not supported by ACF/VTAME.
4. 48,000 bps.
5. Supported as a 3770.
6. Supported as a 3770 or 3791.
7. With SDLC/BSC Switch in SDLC mode.
8. The maximum speed supported is 56K bps.
9. Supported as a 3274 Model 1C or 3770
10. DSLU (5668-006) is required for 7426 or 8775-11, -12 with downstream loadable functions.

BSC Terminals Supported:

5410	X	X	X	X	X	X	X	
5412	X	X	X	X	X	X	X	
5415	X	X	X	X	X	X	X	
8100 (4)	X	X	X	X	X	X	X	
Series/1 (8)	X	X	X	X	X	X	X	X

Notes:

1. By RPQ.
2. Equivalent to 2770/2772.
3. Equivalent to 2770/3780.
4. Supported as a 3276 Model 1, 2, 3, 4, nonswitched connection only.
5. With Communications Adapter.
6. 19,200 - 64,000 bps in line position 1.
7. See M3631 and/or 3632 pages for 3631/3632 features required and software requirements for host connection.
8. Equivalent to 54XX (S/3).
9. Equivalent to 3741 Model 2, 4.
10. Equivalent to 3275 Model 1, 2.
11. Equivalent to 3271 Model 1, 2.
12. Supported as a 2772.
13. Supported as a 3280.
14. Supported as a 3271 Model 2.

Start/Stop Terminals Supported: Only terminals using IBM Terminal Control - Type 1 are supported.

Type	IBM I	Line	Control	Speed in bps				
		75	134.5	300	600	1200		
2740-1		X						
2740-2	X	X				X		
2741		X						

3767-1 (1)	X	X	X	X
3767-2 (1)	X	X	X	X
3767-3 (1)	X	X	X	X
5100 (2)	X	X		
5110	X	X		
(Canada only)				
6733 (3)		X		X<
CMCST (1)	X	X		

Notes:

1. Equivalent to 2740 and/or 2741: Speed 134.5 bps needs 3767 RPQ.
2. Equivalent to 2741.
3. (Canada only) Supported as a CPT-TWX 33/35. <

Autocall Unit Interface (#1020%*x*): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS-366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. Limitations: Does not operate with High-Speed Modem Adapter (#4720), any features with 1200 bps Integrated Modem or with any nonswitched lines. Maximum: Two. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601 and #3701 (in switched operation) for each Autocall Unit Interface installed. #2835 is required to permit attachment to PTT-supplied Automatic Calling Units in certain countries. Specify: Line position, see Table 4 below.

Communications Adapter, Base (#1601%*x*): Allows attachment of up to eight lines (with up to two transmission modes) plus Autocall Unit Interfaces (#1020) for up to two of the lines. The aggregate data rate capability of the Communications Adapter is 64,000 bps. Limitations: (1) SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/370 Release 6 with DOS/VSE running as a guest. (2) Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. (3) The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines refer to "IBM 4331 Processor Channel Characteristics" GA33-1527 (Model Group 1) or GA33-1535 (Model Group 1) which contains tables of pre-analyzed configurations. Maximum: One. Field Installation: Yes. Prerequisites: #1001 is required when more than three telecommunications line features are attached. See Table 1 for microcode storage requirements and possible requirement for #1901 (4331 Model Group 1). Specify: See Table 4, "Communications Adapter Configuration Features and Position Codes", for required specify codes for each line feature attached.

(Except Canada and Japan > 1200 bps Integrated Modem, Switched With Auto Answer (#2831%*x*) <): (Except Canada and Japan > This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the customer engineer for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Connection to the switched network is made via an integrated Public Switched Feature (World Trade Line Plate). Maximum: Three. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4 for Line Position Code and Transmission Mode Codes. <)

(Except Canada > 1200 bps Integrated Modem, Nonswitched (#2832%*x*) <): (Except Canada > This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. Cable Orders: Required for attachment

to external equipment. Maximum: Eight. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operation are possible. < > (Japan only) One specify code #2943 is required for each #2832 which attaches to NTT D-1 services. If two feature #2832s attach to NTT D-1 services, then two #2943s must be specified. This provides NTT Quick Disconnect and network wrap capability. (Start/Stop communications are not supported with NTT D-1 services.) < >

Communication Line Isolation (#2835): Provides an isolation barrier between the modems or Automatic Calling Units and the Communications Adapter, as required by certain World Trade Countries. Up to ten isolation barriers are available and may be used for one Remote Support Facility (#2833), up to two Autocall Unit Interfaces (#1020), up to eight EIA/CCITT Interfaces (#3701) up to two Data Link Adapters (#4840). Maximum: One. Cable Order: Required for each isolation barrier (up to 10). Field Installation: Yes. Prerequisites: Must be associated with at least one #2833, #1020 or #3701.

EIA/CCITT Interface (#3701%*x*): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Non-Clocked Modems (#4696), then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. Maximum: Eight. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601. One #4695 or #4696 is required for each feature #3701 installed. #2835 is required to permit attachment to PTT communications facilities in certain countries. Specify: Start/Stop, SDLC and/or BSC operations are possible. See Table 4 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General Purpose Terminals 3104 Models B1, B2, 8775 Models 1, 2, 3232 Keyboard Printer Model 11, 3287 Models 11, 12 and 3268 Printers Model 2 and/or Control Units 3274 Model 51C, 52C, 61C, 7426 Terminal Interface Unit Model 1 with its associated terminals and 3276 Models 11-14 with the associated terminals to the 4331 Processors. Loop Adapter 1 and 2 (#4830, #4831) provide for direct attachment. A maximum of two Data Link Adapters (#4840) provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter (#4840) can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct-attached loops at 9600 bps or data link-attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments:

- 3104 Display Terminal Models B1, B2
- 3232 Keyboard Printer Model 11
- 3641 Reporting Terminal Models 1, 2
- 3642 Encoder Printer Models 1, 2
- 3643 Keyboard Display Models 2, 3, 4 including #4920 Badge and Document Encoder
- 3644 Automatic Data Unit
- 3645 Printer
- 3646 Scanner Control Unit
- 3647 Time and Attendance Terminal
- 8775 Display Terminal Models 1, 2
- 3287 Printer Models 11, 12
- 3274 Control Unit Model 51C, 61C, 52C with the associated terminals
- 3276 Control Unit Display Station Models 11-14 with the associated terminals

Control Units and Associated Terminals:

- 3274 Control Unit Model 51C, 61C
 - 3178 Display Station
 - 3179 Model 1 Color Display Station (base color)
 - 3179 Model G1, G2 Color Graphics Display Station
 - 3180 Model 1 Display Station
 - 3191 Model A1X, B1X, D1X, D3X Display Station
 - 3192 Model C1X, C3X, D1X, D3X, F1X, F3X, Display Station
 - 3278 Display Station
 - (Canada only) > 3270 Personal Computer ** (Control Unit Mode mode only) < >
 - 3279 Color Display Station
 - 3262 Line Printer
 - 3268 Printer Model 2 and 2C
 - 3287 Printer
 - 3289 Line Printer
 - Personal Computer XT/370 (5160 Model 589) (Control Unit Terminal Mode only) **
 - Personal Computer AT/370 (5170 Model 599 and 739) (Control Unit Terminal Mode only) **
 - 5150/5160/5170 PC with 3278/3279 Emulation Adapter
 - 5160 with XT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) **
 - 5170 with AT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) **
 - 5210 printer Models G01, G02
- 6580 Displaywriter System, Model A04, A06, A08, A10 (25-line display)
- 6580 Displaywriter System, Model B04, B06, B08, B10 (66-line display)
- 3274 Control Unit Model 52C
 - 3178 Display Station
 - 3180 Model 1 Display Station
 - 3268 Printer
 - 3278 Display Station
 - 3283 Printer
 - 3287 Printer
- 6580 Displaywriter System, Model A04, A06, A08, A10, (25-line display)
- 6580 Displaywriter System, Model B04, B06, B08, B10 (66-line display)
- 3276 Control Unit Display Station Model 11-14
 - 3178 Display Station
 - 3179 Color Display Station (base color)
 - 3180 Model 1 Display Station
 - 3278 Display Station
 - 3279 Color Display Station
 - 3262 Line Printer
 - 3268 Printer Model 2, 2C
 - 3287 Printer
 - 3289 Line Printer with its associated terminals
- 6580 Displaywriter System, Model A04, A06, A08, A10 (25-line display)
- 6580 Displaywriter System, Model B04, B06, B08, B10 (66-line display)
- 7426 Terminal Interface Unit Model 1

In addition the following devices can be attached at 38,400 bps:

- 3104 Display Terminal Models B1, B2
- 8775 Display Terminal Models 1, 2
- 3232 Keyboard Printer Model 11
- 3287 Printer Models 11, 12
- 3274 Control Unit Model 51C, 52C with the associated terminals
- 7426 Terminal Interface Unit Model 1 with its associated terminals

(Canada only) > ** Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer or Personal Computers XT/370 and AT/370. < >

For the attachment of 3640 terminals, it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

Cable length for direct-attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps.

For data link-attached loops see 3843 Loop Control Unit. For details refer to GA23-0038, "IBM Multiuse Communications Loop Planning Guide".

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the "IBM Multiuse Communications Loop Planning Guide", GA23-0038, and "Installation Guide", GA23-0039. See also installation tool "CFLOOP" announced with letter P81-78. The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to "IBM 4331 Processor Loop Adapter Feature, Operating Procedures", GA33-1538, and "Problem Determination Procedures", GA33-1540.

Notes:

1. Loop Accessories are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See "Accessories" section for details and ordering information.
2. An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N 1657320.

Communications Facilities: See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes. (The lobe is the actual physical Loop cable.) Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C and/or 3276 Control Units or 38.4K bps for 3104 and/or 7426 Terminal Interface Unit Model 1 with its associated terminals 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #1001.

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes. (A lobe is the actual physical Loop cable.) Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 3104 and/or 8775 and/or 7426 Terminal Interface Unit Model 1 with its associated terminals and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals, and/or 3274-51C, 52C, 61C and/or 3276 Control Units, or 38.4K bps for 3104 and/or 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #4830.

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4331 processor. The feature provides for the attachment of one external modem complying with EIA/CCITT recommendations. CCITT V.24/V.28 support will be provided for nonswitched lines only or a PTT-mandatory modem complying with CCITT recommendations. Transmission speed can be 2400, 4800, or 9600 bps, with half-speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link-attached loops. Support will be provided for the same terminals as on the direct-attached loop. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: Two. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: Loop Adapter 1 (#4830). #2835 is required to permit attachment to PTT communications facilities in certain countries.

(Japan only>One external cable (P/N 8482935) is required when attached to NTT or independent supplier modems in order to meet the self test requirements.<)

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 (#4830, #4831) or Data Link Adapters (#4840) has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Micro- code Prog. Space Bytes	Sys. Ctrl Space Bytes
Microcode Base	42836	7880
1 or mult. 3641 and/or 3647	7800	1060
1 or mult. 3642	5900	580
1 or mult. 3643 w/o #4920	8800	3450
1 or mult. 3643 w/#4920	9400	3450
1 or mult. 3644	4900	-
1 or mult. 3646	2900	256
1 or mult. 3104 and/or 8775 and/or 3287, 3274, 3276, 3645, 7426	2600	-
Terminal*		Ctrl Space
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 3104, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204
Total 1	-----	Total 2

* For additional information on buffer space refer to the "IBM 4331 Loop Adapter Characteristics", GA33-1534.

The storage requirements need to be validated by DP because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the IBM 4331 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3876, an invalid configuration has been selected. A trade-off between features must be considered.

4331 Processor Feature/Facility	System Diskette Records
4331 Basic	2061
DASD Adapter (#3201, #3202)	251
3310 or 3370 Common (#9202, #9201)	71
3310 Att. (#9202)	63
3370 Att. (#9201)	61
3340/3344 Direct Att. (#7851)	73
3340 Att. or DAS Compatibility (#7851 or #7901)	24

MACHINES

DAS Compatibility (#7901)	190
8809 Tape Adapter (#4910)	87
Communications Adapter (#1601)	272
S/S Transmission Mode (#968x)	15
BSC Transmission Mode (#967x)	18
SDLC Transmission Mode (#969x)	52
Inline (System RAS Test Functions, req'd. by CE)	40
1400/1440/1460 Compatibility (#3950)	60
ECPS: VM/370 (#8701)	26
High-Speed BMPX Channel (#1431)	50
Loop Adapter Common (#4830, #4831, #4840)	448
3640 Terminal Att. (#9251, #9252, #9253, #9254, #9256)	252

The maximum number of system diskette records may not exceed 3,876.

Maximum Number of Terminals Attachable Via Loop Adapters/Data Link Adapter: The maximum number of terminals that can be attached to the 4331 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 3104, 8775, 3232 Model 11 terminals or 3274-51C, 52C, 61C, or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see "IBM Multiuse Communications Loop Planning Guide", GA23-0038.

Line Attachment Base For Clocked Modems (#4695%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-Terminating Equipment) which provide clocking and comply with CCITT V.24/V.28 V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network (X.21bis support is available through features #3701 and #4720). See the various line features below to determine when it is required. Limitations: A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4695 installed reduces by one the number of feature #4696 allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: #1601 -- #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

Line Attachment Base For Non-Clocked Modems (#4696%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-Terminating Equipment) which do not provide clocking. See the various features below to determine when it is required.

The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation. Otherwise, the clock speed can be wired at installation to one of the following:

Start/Stop: 75, 300, 600 or 1200 bps
BSC: 600 bps
SDLC: 600 bps

For BSC or SDLC operations, if 1200 bps is wired, then full-speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. Limitations: A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4696 installed reduces by one the number of feature #4695 allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: #1601. Feature #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

High-Speed Modem Adapter (#4720%): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 64,000 bps. Limitations: For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see "IBM 4331 Channel Characteristics", GA33-1527 (Model Group 1) or GA33-1535

(Model Group 2). Cannot be installed with 231X DASD attached to the Block Multiplexer Channel (#1421). Cannot be installed with X.21 Adapter for Nonswitched Networks (#5655) if its speed is 48,000 bps #9831. Maximum: One. Cable Order: Required for attachment to the external modem. Field Installation: Yes. Prerequisites: #1601 and #4695. Specify: BSC and/or SDLC operations are possible -- see Table 4 for Line Position Code and Transmission Mode Codes.

(Canada only) >1200 bps Integrated Modem, Nonswitched (#4781%): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. Cable Orders: Required for attachment to external equipment. Maximum: Eight. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

1200 bps Integrated Modem, Switched With Auto Answer (#4782%): This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network Start/Stop line via an integrated modem at speeds up to 300 bps and for BSC and SDLC at 600 and 1200 bps. Attachment to the switched network is via an IBM-provided cable to (<) (Canada only) > a Data Access Arrangement type CBS (or equivalent). (<) (Canada only) > Maximum: Eight. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Manual Answer (#4787%): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and manual answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. Selection of 2- or 4-wire line operation is made at installation time. The cable group which is ordered also provides for attachment to a Data Access Arrangement type CDT or FCC-registered equivalent for manual answer. Maximum: Eight. Cable Order: Required for one cable group which connects to nonswitched line and to the switched network. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Auto Answer (#4788%): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and auto answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. The same cable group provides for attachment to the switched network to a Data Access Arrangement type CBS or FCC-registered equivalent for auto answer. Maximum: Eight. Cable Order: Required for one cable group which connects to the nonswitched line and to the switched network. Field Installation: Yes. Prerequisites: #1601 and #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4. (<)

Local Attachment Interface (#4801%): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the CE at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may

be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps
400 meters at 2400 bps
200 meters at 4800 bps
100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. Cable Order: Required for attachment to terminal plate. Customer-supplied cable for in-door use. Maximum: Eight. Field Installation: Yes. Prerequisites: #1601 and #4695. Specify: SDLC and/or BSC operations are possible, see Table 4.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 Point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. Limitations: If feature #5655 operates at 48,000 bps (specify #9831), then the following limitations apply: (1) High-Speed Modem Adapter (#4720) cannot be installed. (2) 231X DASD attached to the Block Multiplexer Channel (#1321) cannot be installed. (3) For speed limitations, refer to the Communications Adapter Base feature description. Maximum: Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. Field Installation: Yes. Prerequisites: #1601 -- one #4695 is required for each #5655 installed. Specify: SDLC operation must be specified for this feature -- see Table 4 for line position, transmission mode and transmission speed codes. Note: #9831%*x* is required for 48,000 bps operation. Cable Order: Required for attachment to external equipment.

SDLC (1)	9694	9695	9696	9697	9698

Notes:

1. BSC or SDLC transmission mode with any line attachment feature.
2. Start/Stop transmission mode only with EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696) or with any other features offering 1200 bps Integrated Modems (with prerequisite #4696). (Japan only) Start/Stop transmission mode not available with NTT D-1 services (#2832 with #2943).<
3. Must be associated with EIA/CCITT Interface (#3701 and prerequisite #4695 or #4696). Maximum of two #1020s may be installed.
4. Maximum of 3 can be installed; no line position limitation.
5. The aggregate data rate of the Communications Adapter is 64,000 bps -- Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage -- see Table 1 for micro-

- code storage requirements and possible requirement for Control Storage Expansion (#1901).
6. (Japan only) One external cable P/N 8482935 is required for each #3701 which attaches to NTT or Independent-supplier modems. See Cable Order Form. <
 7. May not be installed when 231X DASD is attached to the Block Multiplexer Channel (#1421).
 8. When changing #9444 to/from #9471, no new hardware or diskette is required.
 9. One specify code #2943 is required for each #2832 which attaches to NTT D-1 services. (If two feature #2832s attach to NTT D-1 services, then two #2943s must be specified.) This provides NTT Quick Disconnect and network wrap capability.

Legend:

%x: Feature supplies diskette for System Diskette facility.

%z: System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

MODEL CONVERSIONS

* UPGRADES FROM 4321/4331 TO 4361 PROCESSORS ARE NO LONGER AVAILABLE.

For model upgrade from the 4331 to a 4361 processor, refer to the M4361 pages.

Model Conversions within Model Group: Can be made in the field.

Model Group Conversions: Customer price quotation and customer order acknowledgement letters for purchase model upgrades must State:

"Installations of this model upgrade involves the removal of parts which become the property of IBM."

Field upgrade from 4331 Model Group 1 to 4331 Model Group 11 is possible -- refer to M4331-11 section.

Field upgrade from 4331 Model Group 1 to 4331 Model Group 2 is possible -- see below.

Field downgrade from 4331 Model Group 2 to 4331 Model Group 1 is not recommended. Field downgrade from 4331 Model Group 11 to 4331 Model Group 1 is not recommended. Refer to Equipment Orders in the GI section for details of this "Not Recommended for Field Installation" classification.

Field upgrade from 4331 Model Group 1 to Model Group 2: For upgrade of a purchase 4331 Model Group 1 processor to Model Group 2, conversion RPQ number 7B0697 is required in addition to the Model upgrade MES if Control Storage Expansion (#1901) is not installed or on order for installation prior to the Model upgrade installation.

ACCESSORIES

Console Table: An operator workstation with modesty skirt has capabilities for two operators with two 3278 Model 2A/3279 Model 2C and room for reference material. Attachable book racks may be ordered for manual storage and also serves as a cable control device for the 3278 Model 2A/3279 Model 2C, telephones, etc. Table dimensions are 1590mm x 815mm and is equipped with gliders. For field installation, order feature via MES specify on the 4300:

4300 Processors Console Table Accessory, #1550
4300 Processors Bookrack and Cable Holder, #1480

Console table will be supplied in the same color as the basic machine. It is available only on a purchase basis.

Loop - Accessories: A group of accessory products are offered to permit plant electricians or contract personnel to install the loops.

Refer to "IBM Multiuse Communications Loop Planning and Installation Guide", GA23-3341, for information necessary to plan the layout and for selection of the loop hardware, for installation and testing information.

Loop Splice Plate (LSP): The LSP splices together two segments of indoor cable or provides a connecting point for future expansion of the loop. The LSP consists of a single connector strip, to which the incoming loop cable and the outgoing loop cable can be attached; it is installed in a standard outlet box for business office environments, or weatherproof outlet box for industrial environments.

Loop Station Connector (LSC): The LSC is available as two unique types: Wrap and radial. The wrap LSC attaches an I/O unit or controller directly to the main loop cable; the radial LSC attaches an I/O unit only through an LWC to the loop. The wrap LSC attaches an incoming and outgoing loop cable; the radial LSC attaches at the end of one loop cable from the LWC.

The wrap LSC also offers the isolation feature of wrapping, which allows the customer to wrap the loop away from a loop wiring failure or to reconfigure the loop during alterations. Both wrap and radial LSCs contain bypass relays that bypass the I/O unit when the I/O unit is powered-off or disconnected. These accessories are installed in a standard or weatherproof outlet box.

2 X 4 Adapter Plate (2AP): The 2" X 4" Adapter Plate is used with the Loop Station Connector and accommodates the use of standard outlet boxes that have dimensions smaller than the outlet boxes defined in the "Loop Installation and Planning Guide". It is not to be used with the environmental boxes.

Loop Wiring Concentrator (LWC): The LWC provides the facility to attach a cluster of I/O units without a large number of drops on the loop cable. It attaches up to eight radial LSCs at the end of loop cables called radials. The point where a radial line terminates at the LWC is called an LWC port. Not all ports have to be used; unused ports can be reserved for future expansion.

The LWC has the same wrapping capability as the wrap LSC. In addition, the LWC allows the customer to bypass one or more of the radials by setting a corresponding switch located inside the LWC.

The LWC has its own enclosure or can be mounted in a NEMA-4X environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Loop Surge Suppressor (LSS): The LSS allows the loop to be run across an outdoor space to another building. It attaches two outdoor cables and two indoor cables, allowing the proper termination and grounding for each type of cable. In addition, the LSS contains four surge protectors, one for each twisted pair in the two outdoor cables, to protect from voltage surges caused by near strikes of lightning. There is no protection in the LSS from a direct lightning strike.

The LSS has its own enclosure or can be mounted in an environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Continuity And Relay Tester: The Continuity and Relay Tester is used with a customer-supplied volt-ohm meter, capable of reading 0.5 ohms and rated at least 5,000 ohms/volt, to verify the loop installation, including loop cabling and accessories, after completion. By plugging the tester into any loop station connector and connecting the volt-ohm meter to the tester, the condition of the wire segment being tested can be determined as to conductor and shield continuity (opens or shorts), wrap switch operation, and total lobe resistance.

The loop station connector relays are also activated and their operation verified with this tester.

Environmental Enclosure	
Mtg Panel	1657306
Sealing - Locknut	1657307

* For use with NEMA-4X enclosure and associated parts (used when installing in harsh environments) or as a replacement part for the LWC or LSS.

** 1 package (10 keys) shipped with each 43XX with Loop Adapter 1 (#4830), 1 key shipped with each LWC and wrap LSC.

Ordering Instructions: Order via MES from location indicated above. When ordering use Machine type 43XX with Loop Adapter 1 (#4830).

Warranty: All loop accessories are warranted free from defects of workmanship and materials for 90 days.

Customer Responsibilities: The customer is responsible to provide (purchase, install, test, and maintain) the loop cables and accessories for terminal attachments. However, see local CE management and GI section 65 for contracts available to assist the customer with installation.

The customer is also responsible for procuring and stocking spare cable and spare parts for loop accessories.

See "IBM Multiuse Communications Loop Planning and Installation Guide" (GA27-3341), for a suggested schedule to allow the customer to plan, install, and test the loop cable and accessories prior to delivery of the system.

It is recommended that the customer order additional loop components for spares with the initial order, as spares will not be stocked in the Branch Office.

To enable a customer to test his installed loops it is recommended that the customer order a Continuity and Relay Tester. Testing the loop wiring will require the tester or its equivalent.

Loop - Cables: Loop Cables may be purchased from IBM or a customer selected source. See "IBM Multiuse Communication Loop Planning and Installation Guide", GA27-3341, for part numbers, specifications and usage which is necessary for pre-planning and ordering.

- Indoor Cable P/N 1657265: UL approved (style 2919) for interconnection of low voltage electronic equipment. Maximum allowable cable temperature range is -34 degrees C. to +80 degrees.
- Indoor Cable P/N 7838694: UL approved for cable tray installation (NEC Art. 725-40b3). Maximum allowable cable temperature range is -34 degrees C. to +90 degrees C.
- Indoor Cable P/N 7838695: UL approved for duct and plenum installation (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 degrees C. to +105 degrees C.
- Outdoor Cable P/N 1657267: For above ground installation. Maximum allowable cable temperature range is -34 degrees C. to +80 degrees C.
- Outdoor Cable P/N 1657268: For below ground installation. Maximum allowable cable temperature range is -34 degrees C. to +80 degrees C.

Ordering Instructions:

- Interior cable (P/N 1657265, 7838694 and 7838695): Should be ordered in lengths of 304.8m to 609.6m (1,000 to 2,000 ft). Additional lengths up to 609.6m (2,000 ft) can be ordered by specifying the length wanted. Indoor cable splices can be accomplished via P/N 1657300. A minimum order quantity is 304.8M (1,000 feet).
- Exterior cable (P/N 1657267 and 1657268): Should be ordered in one continuous length, up to a maximum of 914.4m (3,000 feet), by specifying the length wanted. Outdoor splices with aerial and burial cable should be avoided. Order via MES from Fujisawa. Allow lead time of 120 days.

Warranty: Loop cable is warranted free from defects of workmanship and materials for 90 days.

4331 PROCESSOR MODEL GROUP 11

(NO LONGER AVAILABLE)

The 4331 Model Group 11 is no longer available -- MES orders for upgrades, features, released RPQs and accessories are not affected. No new RPQs will be accepted.

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the arithmetic, logic and processor storage functions of the 4331 Processor models, including I/O channels and integrated adapters.

MODEL GROUP 11

Model J11: 1,048,576 bytes of Processor Storage -- 4,096 bytes of Buffer Storage.

Model K11: 2,097,152 bytes of Processor Storage -- 4,096 bytes of Buffer Storage.

Model L11: 4,194,304 bytes of Processor Storage -- 4,096 bytes of Buffer Storage.

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C with keyboard and control panel is required for this purpose.

Maximum Configuration: The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to "IBM 4331 Processor Channel Characteristics", GA33-1550 or use the HONE aid ANCHLOAD.

HIGHLIGHTS

The 4331 Model Group 11 is a featured processor with up to four megabytes of processor storage and contains the following standard hardware features:

Feature Number on Model Group 1 and 2	
One block multiplexer channel	#1421
Communications Adapter Base	#1601
128K bytes of control storage	#1901*
Display/Printer Adapter	
Expansion (16 ports)	#2001
One DASD adapter (3310, 3370 A1 attachment)	#3201
One 8809 adapter	#4910
One byte multiplexer channel	#5248
Power Interface	#5531
3340/3344 Direct Attachment	#7851
ECPS:VM/370	
(VM assist microcode)	#8701

* Model Group 1

These features are not ordered separately. The processor can contain up to 4,194,304 bytes of monolithic processor storage. Data flow is four bytes parallel. Processor fetch and store cycles for the buffer are each 200 nanoseconds for four bytes. Buffer storage is automatically replenished from processor storage in 64 byte units at a time. The 64-byte fetch cycle requires 2.6 microseconds, the store cycle requires 3.1 microseconds. The processor is microcode controlled.

Note: The microcode which controls system operations resides in Processor Storage, Reloadable Control Storage and Read-Only Storage. 4331 Model Group 11 includes 131,072 bytes of Control Storage plus 12,288 bytes of Read-only Storage. In addition to the microcode contained in this storage, approximately 200,000 bytes of Processor Storage are occupied by microcode, RAS workspace and system data.

Standard Functions:

- Processor storage: 1,048,576, 2,097,152 or 4,194,304 bytes for Model Group 11. Approximately 200,000 bytes of processor storage are allocated for system/microcode use. The 4331 Model Group 11 configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 for details.
- ECPS:VSE Mode or S/370 Mode: In S/370 mode, both Extended Control (EC) and Basic Control (BC) are available. The 4331 Processor operates in either S/370 Mode or in Extended Control Program Support/VSE Mode. The system mode is selectable at Initial Program Load (IPL) time: S/370 Mode allows operation of VM/370, VSE, DOS/VS and DOS. (See "Programming Note" below for details.) ECPS: VSE mode supports operation of an appropriately generated VSE system, with enhanced systems performance.
- Display/Printer Adapter allows attachment of:
 - 3178 Display Station
 - 3180 Model 1 Display Station
 - 3191 Model A1X, B1X, D1X, D3X Display Station
 - 3192 Model C1X, C3X, D1X, D3X, F1X, F3X Display Station
 - 3262 Line Printer Model 1 (650 lpm system printer)
 - 3262 Line Printer Model 11 (325 lpm system printer)
 - 3268 Printer Model 2 and 2C (340 cps)
 - 3289 Line Printer Model 4 (400 lpm system printer)
 - 3278 Display Station Model 2, and keyboards
 - (Canada only) > 3270 Personal Computer (Control Unit Terminal Mode only). Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer.<)
 - 3279 Color Display Station Model 2A and keyboards
 - 3278 Display Console Model 2A, keyboard and control panel
 - 3279 Color Display Console Model 2C, keyboard and control panel
 - 3287 Printer Models 1, 2, 1X and 2C
 - 4224 Models 2XX (200/400 cps) (Non-IPDS Mode)
 - 4234 Model 1 Dot Band Printer
 - 4250 Printer
 - Personal Computer XT/370 (5160 Model 589) (Control Unit Terminal Mode only) *
 - Personal Computer AT/370 (5170 Model 599 and 739) (Control Unit Terminal Mode only) *
 - 5150 attached to 3278/3279
 - 5150/5160/5170 PC with 3278/3279 Emulation Adapter
 - 5160 with XT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) *
 - 5170 with AT/370 Option Kit and 2378/79 Emulation Adapter (Control Unit Terminal Mode only) *
 - 5210 printer Models G01, G02
 - 6580 Displaywriter System Model A4, A6, A8, A10 (25-line display)
- * Specify #9843 on 4321 and 4331 must be ordered for attachment of the IBM Personal Computer AT/370 and XT/370.
- The System Diskette Facility is the microcode loading system for the 4331 Processor. The diskettes shipped with the 4331 Processor will supply the required microcode for diagnostics, Standard Functions, and the special features ordered. The System Diskette Facility also allows storage of failure data

from 4331 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.

- Reloadable and Read-Only Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode in support of standard functions and special features of the 4331 Processor. The Reloadable Control Storage is not available to the user. 4331 Model Group 11 includes 131,072 bytes of Reloadable Control Storage plus 12,288 bytes of ROS.
- Remote Support Facility (RSF) is an IBM CE tool permitting IBM Field Technical Support Center specialists to remotely monitor and/or perform problem diagnosis on the 4331 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization) remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML/IPL and execute manual control functions on a remote 4331 via a 3275 (real or emulated) terminal at a host location.

Other Standard Functions are:

- Virtual Storage capability by Dynamic Address Translation
- One level addressing facility for improved virtual storage control by VSE (ECPS:VSE mode)
- Channels with virtual storage addressing (ECPS:VSE mode)
- Channel Indirect Data Addressing (in S/370 Mode)
- S/370 Universal Instruction Set
- Extended-Precision Floating Point
- Conditional Swapping
- CE maintenance support functions
- Storage Protection (Store and Fetch)
- Byte-Oriented Operands
- Clock Comparator and CPU timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling
- Program Event Recording
- Monitoring
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- 4,096 bytes of high-speed storage

Programming Note: The ECPS:VSE mode may be invoked at IPL time and supports operation of an appropriately generated VSE Control Program with VSE/Advanced Functions and the SSX/VSE control program.

In S/370 Mode, operation of VSE with VSE/Advanced Functions (generated for use in S/370 Mode), VM/370 Release 6 with or without VM/System Product or VM/BSE Release 2 or VM/SE Release 2 are supported. Although not supported, DOS Release 26 and DOS/VS Release 34 will operate on the 4331 Processor when in S/370 Mode.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer. A 3278 Display Console Model 2A or a 3279 color Display Console Model 2C is required for this purpose. The Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4331 Processor hardware system, and one displays messages unique to the 3278 Display Console Model 2A or the 3279 Color Display Console Model 2C. The console address is selected at system installation time from the range 009 through 01F.

The console functions in one of two modes: "Display Mode" or the "Printer-Keyboard Mode". In the "Printer-Keyboard Mode", the Display Console uses the keyboard for input and the display and a 3287 Printer Model 1, 2, 1C and 2C or 3268 Model 2 or 2C for or 4234 Model 1 output. The CRT, keyboard and printer appear to the system as a 1052 Printer/Keyboard and operate compatibly with S/360

console operations or as a 3210/3215 Console Printer-Keyboard and operate compatibly with S/370 Console operations. The operation of the 3287 or 3268 Model 2 or 2C in this mode is optional, but recommended. The "Printer-Keyboard Mode" and the 4250 attachment are mutually exclusive.

(Japan only) Printer keyboard mode is not available together with the Katakana language option for the operator console or for 3278 Display or 3287 Printer attached to the Display/Printer Adapter. <)

In "Display Mode" the keyboard is used for input and the CRT with 20 lines by 80 characters/line is used for output. The 3287 Models 1, 2, 1C or 2C or 3268 Model 2 or 2C if attached, has its own address and must be supported by either the 3277 Console Support of DOS/VS Release 34, the 3277 Console Support of VSE, the local-attached 3286/3287 Printer support of VM/370, or the equivalent of any of these.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IPL and execute manual control functions on a remote 4331 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

ECPS:VM/370: The 4331 Processor provides ECPS:VM/370 support at Level 19. This support is compatible with VM/370 Release 6 and VM/System Product or VM/BSE Release 2 or VM/SE Release 2 corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation and Virtual Interval Time. Limitations: May only operate when S/370 Mode has been invoked by IPL.

Byte Multiplexer Channel (Standard): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. The channel permits simultaneous operations of low-speed devices. Operates at up to 36K bytes per second in single byte mode. Up to 500K bytes per second in burst mode. See "IBM 4331 Channel Characteristics", GA33-1550, for devices which may be attached and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0. Limitations: Magnetic tape devices may not be attached to the byte MPX channel when 231X devices are attached to the block multiplexer channel.

Subchannels: The 4331 Model Group 11 byte Multiplexer Channel provides up to 36 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 36 subchannels is reduced by one for the Communications Adapter and one for each telecommunication line on the Communications Adapter.

Block Multiplexer Channel (Standard): Provides eight control unit positions. The Block Multiplexer Channel permits simultaneous operation of high-speed devices. Ability to "Block Multiplex" and facility for multiple requesting allows several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. 33XX devices (and the 3630 or 3880 storage control units) do not attach.

Data rate is up to 1.25 million bytes per second -- see "IBM 4331 Channel Characteristics", GA33-1550, for details. Channel addresses may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

- Up to 256 non-shared or shared subchannels each with devices in multiples of 8, up to a total of 256 devices.

Integrated I/O Adapters: The following I/O adapters control the designated I/O devices:

- DASD Adapter (Standard)
- 8809 Magnetic Tape Unit Adapter (Standard)
- Display/Printer Adapter (16 Ports, Standard)
- Communications Adapter Base (Standard)
- 5424 Adapter
- Loop Adapter

MACHINES

Note: All data passing through the system for any I/O device interferes with the data flow for other devices, producing I/O limitations. The limitations take two forms:

1. Hardware exclusives listed in the feature descriptions.
2. I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:
 - The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
 - The number and speed of lines attached to the Communications Adapter.
 - The number and class of overrunable devices on the Byte Multiplexer Channel.

It is necessary to consult the "IBM 4331 Channel Characteristics Manual", GA33-1550, to properly configure a 4331 with an I/O configuration that has not previously been analyzed.

DASD Adapter (Standard): One DASD Adapter provides direct attachment of 3310, 3370 A1/A2 and/or 3340/3344 Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 operate in fixed block mode. The 3340/3344 operates in Count-Key-Data (CKD) mode. When using 3340/3344 exclusively system throughput can be degraded by a factor of more than two compared with use of fixed block mode devices. Specify: #9318%z if 3370 Model 2 attaches to the DASD Adapter. DASD CKD Emulation (#7901) is not provided if 3370 A2/B2 is installed.

Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string. The maximum number of strings of each type of device on the DASD Adapter is:

1. Up to four 3310 Model A1s or A2s with 3310 Model B units attached, up to a maximum of 4 drives per string.
2. Up to four 3370 Model A1/B1 with 3370 Model B1/B2 units attached, up to a maximum of 4 devices (8 actuators) per string. Intermix of 3370 Models 1 and 2 on strings and within a string is supported.
3. Up to two 3340 Model A2s with 3340/3344 Model B units attached, up to a maximum of eight drives per string. Attachment of 3340/3344 is limited to two strings on the system.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344 is limited to the static assignment of a shared string to one processor at a time. The 3340-A2 or the 3370-A1/A2 must have the string switch feature #8150 installed.

With a direct-attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a S/3 Model 12 or 15. This function is available as a conversion aid for users converting to the 4331 Processors from a S/3.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	01	02	03	04	05	06	07
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F

and

X10	11	12	13	14	15	16	17
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console Model 2A or a 3279 Color Display Console Model 2C and up to 15 additional devices chosen from the list below:

- 3178 Display Station
- 3180 Display Station Model 1 *
- 3191 Model A1X, B1X, D1X, D3X Display Station
- 3192 Model C1X, C3X, D1X, D3X, F1X, F3X Display Station
- 3262 Line Printer Model 1 and 11 (650 and 325 lpm)
- 3268 Printer Model 2 and 2C (340 cps)
- 3278 Display Station Model 2
- (Canada only) > 3270 Personal Computer (Control Unit Terminal Mode only). Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer. <)
- 3279 Color Display Station Model 2A
- 3287 Printer Models 1, 2, 1C and 2C (80 and 120 cps)
- 3289 Printer Model 4 (400 lpm)
- 4224 Models 2XX (200/400 cps) (Non-IPDS Mode)
- 4234 Model 1 Dot Band Printer (300 lpm)
- 4250 Printer
- Personal Computer XT/370 (5160 Model 589) (Control Unit Terminal Mode only) **
- Personal Computer AT/370 (5170 Model 599 and 739) (Control Unit Terminal Mode only) **
- 5150 attached to 3278/3279
- 5150/5160/5170 PC with 3278/3279 Emulation Adapter
- 5160 with XT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode)
- 5170 with AT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode)
- 5210 printer Models G01, G02
- 6580 Displaywriter System Model A4, A6, A8, A10 (25-line display)

* The 3180 Model 1 is supported only when it is emulating a 3278 Model 2. The 3180 extended functions or larger screen formats are not supported.

** Specify #9843 on 4321 and 4331 must be ordered for attachment of the IBM Personal Computer XT/370 and AT/370.

These machines may be installed in any combination, provided that (1) only 15 devices are installed and (2) no more than two System Printers (3262 and/or 3289) are included. Due to the processing power requirements, it is not practical to attach more than four 4250 printers. The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The file transfer function from Personal Computer to host and the screen capture function to the PC printer or diskette are not supported on the Personal Computer attached to the 3278/3279 if connected to the Display Printer Adapter.

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287 or 4234 Model 1 or 4224 Printer may be used as a console hardcopy device; one or more 3287 or 4224 or 4234 Model 1 Printers may be used as hardcopy workstation devices; one or more 5210 may be used as high quality printer in 3287 mode only. The 3178 Display Station, 3180 Model 1 Display Station, 3278 Display Station Model 2, (Canada only) > 3270 Personal Computer (Control Unit Terminal Mode only)**,<) or 3279 Color Display Station Model 2A may be used as workstations for user-written applications.

The 6580 Displaywriter System emulates a 3278 Model 2 Display Station, and, optionally, a 3278 Model 1, 2 Printer. The 6580 may be used as a workstation for user-written applications and for hard copy, as a 3278 Model 2 and 3287 Model 1, 2. Display/Printer Adapter support includes all standard functions of the 3274 Model X1B with the 3178, 3180 Model 1, 3278 Model 2, (Canada only) > or 3270 Personal Computer (Control Unit Terminal Mode only)**,<) or 3279 Model 2A or 5150/5160 PC with 3278/3279 Emulation Adapter attached. In addition, the following 3180 Model 1, 3278 Model 2 or 3279 Model 2A special features are supported: Keyboard Numeric Lock (standard on the 3178 or 3180 Model 1), Audible Alarm (standard on the 3178, 3180 Model 1 or 3279), Security Keylock (standard on the 3178 or 3180 Model 1) and Switched Control Unit (Switch control unit as an accessory on the 3180 Model 1). Other 3278 Model 2 or 3279 Model 2A special features are not supported. When used as workstations, 3278 or 3279 Display Station keyboard feature codes #4621, #4622, #4623, #4627, , #2715, #2716, #2717, or 3178 Model C1 or C2, or 3180 Model 11X, 12X, or 13X may be selected. If two different keyboards are required for a workstation, one must be

#4621(Japan only > or #2715 <). Addresses for these devices are selected at installation time from the range 009 through 01F. Specify #9843 must be ordered for attachment of 5150/5160 PC with 3278/3279 Emulation Adapter.

(Canada only > ** Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer. <)

The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Work Station licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (#8332) and specify #9842 in the 4331 must be ordered for attachment of Displaywriter.

Two language/keyboard combinations may be installed on the Display/Printer Adapter. Language(s) supported and keyboard(s) to be attached must be specified at order entry-time or via MES -- see "Specify" below.

(Except Canada > If a Katakana operator console is installed, the 3278 Model 2 or 3279 Model 2A Display Stations with Katakana installed on the Display/Printer Adapter must have typewriter keyboard #2715 or #2717. <)

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4331 Processor. This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below). The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with VSE, refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and S/1 and S/3, 32, 34, and 38. One diskette is shipped with the feature. Additional diskettes are available from IBM National Distribution Division (NDD). Device address is selected at installation time from the range 009 through 01F. Limitation: Support by VM/370 via IUP only.

8809 Magnetic Tape Unit Adapter (Standard): Provides direct attachment of 8809 Model 1A and up to five additional 8809 tape units (consisting of a mix of 8809 Model 2s and 3s) -- allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for loading or off-loading DASD devices or in start/stop mode (data rates is up to 20K bytes per second) for other data processing operations. Although physical Read-Backward commands are not supported, the Read-Backward operation is simulated in the Logical IOCS (MTMOD) of VSE. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

5424 Adapter (Optional): Provides native attachment of 5424 Multi Function Card Unit Models A1 or A2 (Japan only > (Models K1, K2, K3) <) for 96-column card operations, device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4331 is a native attachment method for the 3640 Plant Data Communications Terminals -- 3104 Display Terminals Models B1, B2 -- 8775 Display Terminal Models 1 and 2 -- 3232 Keyboard Printer -- 3287 Printer -- 3274 Control Unit Model 51C, 61C, 52C -- 3276 Control Unit Display Station with their associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexibility.

A maximum of two direct-attached loops and two data link adapters are supported. Each of the direct-attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one IBM 3843 Loop Control Unit as point-to-point or up to four Loop Control Units as multipoint configuration. Details on programming information are provided in the "IBM 4331 Loop Adapter Programming Guide", SC31-0500-0.

User-written programs for loop-attached terminals reside in the 4331 Processor storage and are controlled by VSE and ACF/VTAME

or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition IBM offers a PRPQ to CICS/VS announced December 23, 1980. This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4331 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

1. Terminal initialization
2. Terminal re-initialization
3. 3642 encode check handling
4. Transaction selection

Communications network management problem determination support for 4331 loop-attached 3104 Display Terminals, 8775 Display Terminals, 3232 Keyboard Printer Model 11, 3276 Display Control Stations and 3274 Model 51C, 52C 61C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal Models 1, 2 -- 3642 Encoder Printer Models 1, 2 -- 3643 Keyboard Display Model 2, 3, 4 including #4920 Badge and Document Encoder -- 3644 Automatic Data Unit -- 3645 Printer -- 3646 Scanner Control Unit -- 3647 Time and Attendance Terminal -- 3104 Display Terminal Models B1, B2 -- 8775 Display Terminal Models 1, 2 -- 3232 Keyboard Printer Model 11 -- 3287 Printer Models 11, 12 -- 3274 Control Unit Model 51C, 52C, 61C -- 3276 Control Unit Display Station Models 11-14 with their associated terminals -- 3843 Loop Control Unit. Device addresses are 040 through 07E.

Communications Adapter Base (Standard): The 4331 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocal unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit Terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For Communications Adapter Base details, see section "Communications and Loops" below.

IBM Stand-Alone Modems

Switched	
3976 Model 2	up to 300 bps
3976 Model 3	600/1200 bps
(Canada only >	
3863	2400 bps
3864	4800 bps
3872	1200/2400 bps
3874	2400/4800 bps <)

Nonswitched	
3976 Model 1	up to 200 bps
3976 Model 3	600/1200 bps

(Canada only > The following modems, except the 3868, are supported with the Switched Network Backup feature -- see M3863, 3864, 3865, 3872, 3874, 3875 pages for details: <)

3863	2400 bps
3868 Model 1	2400 bps
3864	4800 bps
3868 Model 2	4800 bps

MACHINES

3865	9600 bps
3868 Model 3/4	9600 bps
3872	1200/2400 bps
3874	2400/4800 bps
3875	3600/7200 bps

IBM Integrated Modem (V.23, 1200 bps): The following integrated modem configurations are available:

- Switched network with auto answer
- Nonswitched line, 2- or 4-wire
- (Canada only) Nonswitched line with switched network backup and auto answer.
- Nonswitched line with switched network backup with manual answer. <)

OEM Modems: OEM modems that comply with EIA RS-232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

PTT-Mandatory Modems: The Communications Adapter will support the mandatory modems which the PTTs in various WT countries provide for attaching Data Terminal Equipment (DTE), such as the Communications Adapter, to their facilities. See M2700 pages

X.21 Adapter for Nonswitched Networks: The X.21 interface allows attachment to the X.21 facilities available in certain countries by way of an internal X.21 adapter.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- The Communications Adapter will support mandatory autocal Unit which the PTTs in various WT countries provide in accordance with CCITT V.25. See Autocall Unit Interface (#1020) for specifics.
- Other Automatic Calling Equipment which complies with EIA RS-366 or CCITT V.25 may be connected to the Autocall Unit Interface (#1020) under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Power (1-phase, 3-wire, 60 Hz): #9902 for 208V, #9914 for 240V, #2732 for 200V, 2803 for 220V.
(1-phase, 3-wire, 50 Hz): #2813 for 220V, #2801 for 240V, #2806 for 200V, #2821 for 230V. (Meets Japanese Current Leakage Requirements.)
- Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray.
- Machine Nomenclature: National safety regulations require maintenance labels in local language. The language is determined by default from the three digit country code in the machine order. If the installation country is different from the order country, specify #2900 which provides sets of labels in other languages. The IBM CE selects and installs the appropriate one. (Canada only) In Quebec: Specify #2935 for Canadian French #2934 for English. <)
- Specify #9841 in 4331 must be ordered for attachment of 3268 or 4234 Model 1 to 4331. Provides microcode and/or maintenance documentation if machine is below EC 366586 (microcode for 4331) and/or below EC 366584 (maintenance document) for all Models.
- Specify #9843 must be ordered for attachment to 5150/5160 PC with 3278/3279 Emulation Adapter.

- 4250 Printer Attachment: Specify (#9260) for 4250 Printer attachment to display adapter.
- 6580 Displaywriter System Attachment: Specify (#9842) for 6580 attachment to the Display/Printer Adapter.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4331 Processor. It provides service personnel the capability of remotely controlling the 4331 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on ordering and customer responsibilities, see Systems and Procedure Manual.

(Australia and Brazil only) When specified, each 4331 Processor will be equipped with either a CCITT interface or 1200 bps Integrated Modem (switched network, manual answering) for RSF.

Specify #2838 for CCITT interface.

Specify #2836 for 1200 bps Integrated Modem, switched network, manual answer. <)

- (Canada only) Specify #9510 for Remote Support Facility via a 1200 bps integrated modem, switched network, manual answer. <)
- (Japan only) Each 4331 Processor will be equipped with either a CCITT interface or 1200 bps Integrated Modem, non-switched:

Specify #2838 for acoustic coupler interface.

Specify #2944 for 1200 bps Integrated Modem, non-switched. Also specify #2943 for the NTTCA-2 modem service cable connector. <)

All other countries, consult your country's DPCE department.

- Remote Operator Console Facility (ROCF): This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4331 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4331 are suppressed when ROCF is in use. Field Installation: Yes.

* 3275 Model 2 can only be obtained on an "as available" basis.

(Except Canada and Hong Kong) Specify ROCF feature #2838 for CCITT V.23/V.24/V.28 Interface. The requisite customer-supplied or PTT-mandatory non-clocked external modem attached to feature #2838 must include auto answer. Line discipline is BSC, 600 or 1200 bps. Note: Katakana is not supported for 3275 Model 2 as the remote console. Katakana is supported only by the VM/Pass-Through Facility Program Product. <)

(Canada only) Specify ROCF feature #9511 for EIA-Interface. The requisite customer-supplied non-clocked WE 202S equivalent external modem attached to feature #9511 must include auto answer. Line discipline is BSC, 600 or 1200 bps. <)

(Hong Kong only) Specify #2838 for CCITT V.23/V.24/V.28 Interface and #2839. The requisite customer-supplied or PTT-mandatory non-clocked external modem must include auto answer. Line discipline is BSC, 600 or 1200 bps. <)

- Loop-Attached Terminals: The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274-51C, 52C, 61C, and/or 3276 Control Units

are attached to the system via Loop Adapter 1 and/or 2 (#4830, #4831) and/or Data Link Adapters (#4840).

- #9251 3641 Reporting Terminal/3647 Time and Attendance Terminal
- #9252 3642 Encoder Printer
- #9253 3643 Keyboard Display
- #9254 3644 Automatic Data Unit (ADU)
- #9256 3646 Scanner Control Unit
- #9257 8775 Display Terminal 3287/3645 Printer, 3274-51C, 52C, 61C and 3276 Control Unit, and 3104 Display Terminal
- #9258 3643 Keyboard Display with #4920

- Keyboard/Character Set Language: Must be specified on the 4331 for 3178, 3180, 3191, 3192, 3278, 3279, 3287 devices attached to the Display/Printer Adapter and for 3641, 3642, 3643 devices attached to the Loop/Data Link Adapter. It must correspond to the Keyboard/Character Set Language ordered for the device.

1. Specify language from Table 1 Column A. This language is mandatory for the 3278 Model 2A or the 3279 Model 2C; and can be used for 3178 model C2; 3180 model 1; 3191 model A1X, B1X; 3192 model C1X, D1X, 3278 model 2; or 3279 model 02X, with typewriter keyboards and 3287 printers.
2. For attachment of 3178 Model C1 or 3180 Model 1 or 3278 Model 2 with Data Entry Keyboards, select one language from Table 2 column B and specify one of the mutually exclusive keyboard types. #9301 for Data Entry (3178 Model C1 #4622, 3178 Model C1 #2716 or 3180 Model 1 #4601), or #9302 for Data Entry, keypunch-layout (#4623). Note: 3178 Model C1K cannot be used and Data Entry Keyboard cannot be specified for 3180 Model 1, 3278 Model 2 or 3279 Model 02X display workstations if Katakana is to be used on both the operator console and the workstations.
3. If alternate language for 3178 Model C2, 3180 Model 1, 3278 Model 2 or 3279 Model 02X with typewriter keyboard is required, specify language from Table 1 Column B and keyboard type as follows: #9303 for typewriter keyboard 3178 Model C2, 3180 Model 1 with #4600, #4621, #4627, #2715, #2717. Note: 3178 Model C1, 3180 Model 1, 3278 Model 2 or 3279 Model 02X with Data Entry Keyboard cannot be attached in this case.
4. For 3641/3642/3643 devices English US #2956 is automatically supplied. In addition, one alternate language can be selected from Table 1, column B. It must correspond to the alternate language which may have been specified for 3178/3180/3278/3279/3287 devices. As an exception, #2930 US Keyboard/Katakana Display, not available for 3278/3279, may be specified for 3643 in addition to the alternate language for 3178/3180/3278/3279/3287.

Table 1 - 4331 Keyboard Language/Character Set Language

	A Mandatory	B Alternate Language and/or Keyboard Type
International*	#0950	#2950
US	#0956	#2956 (1)
EBCDIC*	#0951	#2951
Brazil	#0975	#2975
Canadian French	#0956 (4)	#2977
Japanese Eng.*	#0955	#2955
Katakana	#0973 (3)	#2973
Spain*	----	#2960 (5)

Span Speaking #0969 #2969 (2)
US Keyboard ---- #2930 (6)

* Not available on 3180.

Notes:

1. Automatically supplied for 3641/3642/3643 devices.
2. Not available for 3642. Spain #2960 will be supplied.
3. For Japan only. For Katakana, specify #0973 on 4331, and #2720 and #2773 on the 3278 Model 2A or the 3279 Model 2C.
4. For Canadian French, specify on the 4331 US #0956. For the 3278 Model 2A or 3279 Model 2C, Canadian French Keyboard Language (#2977) must be specified.
5. Not available for 3278/3279/3287 and 3641/3643 devices. This character set is used for 3642 when Spanish Speaking is specified.
6. Only available for 3643.

(Canada only) Specify #9843 on 4331 must be ordered for attachment of the 3270 Personal Computer. <)

- For 3641/3642/3643 devices, English US #2956 is automatically supplied.
- Console Table: A console table is available -- see #1550 or M4331-1 "Accessories" section. Book Rack and Cable Holder -- see #1480 or M4331-1 "Accessories" section.
- See 3278 Display Console Model 2A or 3279 Color Display Console Model 2C for console cabling.

SPECIAL FEATURES

Legend:

%x: Feature supplies diskette for System Diskette facility.

%z: System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter (when more than three line features are attached), and the Adapter Logic. Maximum: One. Field Installation: Yes. Prerequisites: #1002 or for the Loop Adapter (#4830) and/or Communications Adapter Base with more than three line attachments #4695 and/or #4696.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). Maximum: One. Field Installation: Yes. Prerequisites: #1001.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, use the following procedure. Note: An interactive HONE aid (ANCHLOAD) is available dependent on the control program or program product device support to facilitate this procedure.

1. Consulting Table 2, determine the microcode groups required to support the features and I/O to be installed.
2. On Table 3, place a check mark in the appropriate rows.
3. Find the sum of Table 3 for the required microcode groups.
4. Subtract the control storage of 143,360 bytes from the total of Table 3 and round up to the next multiple of 4,096.

The result of step 4 determines the amount of processor storage occupied by microcode and should be subtracted from the processor storage size ordered to determine the amount available

for the user. The storage for group 3 specified in Table 2 (DAS Compatibility #7901) is only occupied if the feature is activated at IPL time.

Table 2 - Microcode Groups

Function/Feature Installed	Micro-code Group
4331 Model Group 11 Processor	1
Direct Access Storage Compatibility (#7901)	2
BSC lines installed (#9671-#9678)	3
S/S lines installed (#9681-#9688)	4
SDLC lines installed (#9691-#9698)	5

Note: The Microcode Group 1 contains 4331 Model Group 11 standard hardware features, see M4331-11 section.

Table 3 - Storage Per Microcode Group

Micro-code Grp	Control Storage -or- Proc. Storage	Notes
1	331776 8800 1800	Plus Per 3340 buffer. For a 2nd string of 3340s attached to the DASD adapter.
2	28948 0 7680 13312 8704	Plus Per 2311 buffer. Per 2314 buffer. Per 3330 buffer. Per 3340 buffer.
3	6144	
4	5120	
5	10240	

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. Limitations: Not supported by VM/370. Maximum: One. Field Installation: Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. Maximum: One. Cable Order: Required. Field Installation: Yes. Prerequisites: External Devices must meet the interface specifications outlined in "S/360 Direct Control Feature OEMI", GA22-6845.

5424 Adapter (#3901%*x*): Allows attachment of one 5424 Multi-Function Card Unit Model A1 or A2. (Japan only) Also allows attachment of one 5424 Model K1, K2 and K3. <) Limitations: The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed

with the Loop Adapter (#4830). Maximum: One. Field Installation: Yes. Prerequisites: #1001 and #1002.

Power Interface, Add'l (#5532): Provides power control to the 4331 Processor for control units attaching to the 4331 Byte Multiplexer Channel and Block Multiplexer Channel. Table 4 below lists the control units/devices for which this feature must be installed in the 4331 Processor. Standard Power Interface allows attachment of up to eight of these control units; Power Interface, Add'l (#5532) allows attachment of eight additional control units for a maximum of 16 per processor. Maximum: One. Field Installation: Yes.

Table 4 - Control Units/Devices Requiring Power Interface Features

Mandatory:

1255 Magnetic Character Reader
1270 Optical Reader Sorter
1275 Optical Reader Sorter
1287 Optical Reader
1288 Optical Reader
1419 Magnetic Character Reader
1442 Card Read Punch Model N1
1442 Card Punch Model N2
1443 Printer Model N1
2314 Storage Control* Model A1 and B1
2314 Direct Access Storage Facility* Model 1
2415 Magnetic Tape Unit and Control
2501 Card Reader Model B1 and B2
2520 Card Read Punch Model B1, B2 and B3
2701 Data Adapter Unit
2702 Transmission Control*
2703 Transmission Control*
2803 Tape Control
2821 Control Unit Models 1, 2, 3, 5 and 6
2822 Paper Tape Reader Control*
2840 Display Control*
2841 Storage Control
3272 Control Unit
3411 Magnetic Tape Unit and Control
3505 Card Reader
3540 Diskette Input/Output Unit
3704 Communications Controller
3705 Communications Controller
3791 Controller
3800 Printing Subsystem
3803 Tape Control
3811 Printer Control Unit
3881 Optical Mark Reader Model 1
3886 Optical Character Reader Model 1
3890 Document Processor
3895 Document Reader/Inscriber

* No longer available

Not Mandatory, but can utilize Power Interface features:

3274 Control Unit
3340 Direct Access Storage Facility
3370 Direct Access Storage
3203 Printer Model 5

Direct Access Storage Compatibility (#7901%*z*): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100Mb/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 Mode under DOS, DOS/VS, or VM/370, in ECPS/VSE Mode under DOS/VSE. Under DOS/VSE, data sets in fixed block format and in emulated format can co-reside on the same 3310/3370 volume. With DOS/VSE a variable number of full or partial CKD volumes can be stored the 3310 or 3370

up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With VM/370 partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Maximum Number of Emulated Full Volumes:

Compat.
Type

	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63
3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to "IBM 4331 Compatibility Features", GA33-1528.

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE or VM/370. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: (1) Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. (2) Operation of emulation and direct-attached 3340/3344 is limited to two strings on the system. (3) One type of emulation can be activated at IPL time. (4) 3330 Model 11 cannot be emulated. (5) Emulation cannot be used on 3370 drives which are shared via a string switch. (6) VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370. (7) DASD CKD is not provided if 3370 A2/B2 is installed.

Program Order: The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, (5745-030) or combined with VSE/Advanced Functions, and VM/370 (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. Maximum: One. Field Installation: Yes. See Tables 2 and 3 for microcode storage requirements.

COMMUNICATIONS AND LOOPS

Communications Adapter Base (Standard): Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1535. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 64,000 bps and may operate concurrently with other lines provided the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/370.

Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to 8 line features without internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) with clock.
- Up to 8 line features with internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) without clock.
- Up to 1 synchronous high-speed line feature.
- Up to 8 line features with integrated modems.
- Up to 8 line features with local attachments.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-Keyboard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half-speed operation for synchronous lines only (for both clocked and non-clocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the CE:

- Duplex instead of half-duplex connection (two-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High-speed operation for one line (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Limitations: (1) SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/370 Release 6 with DOS/VSE running as a guest. (2) Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. (3) The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines, refer to "IBM 4331 Processor Channel Characteristics", GA33-1535, which contains tables of pre-analyzed configurations. Prerequisites: #1001 is required when more than three telecommunications line features are attached. See Table 2 for microcode storage requirements.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

Terminals Supported: For supported terminals refer to tables in the communications adapter feature description of 4331 pages for Model Group 1 and 2 or for more details to the M2700 pages.

Autocall Unit Interface (#1020%): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the

switched telephone network. Automatic Calling Equipment complying with EIA RS-366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. Limitations: Does not operate with High-Speed Modem Adapter (#4720), any features with 1200 bps Integrated Modem or with any nonswitched lines. Maximum: Two. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: #3701 (in switched operation) for each Autocall Unit Interface installed. #2835 is required to permit attachment to PTT-supplied Automatic Calling Units in certain countries. Specify: Line position, see Table 5 below. (Except Canada and Japan > 1200 bps Integrated Modem, Switched With Auto Answer (#2831%): <) (Except Canada and Japan > This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Connection to the switched network is made via an integrated Public Switched Feature (WT Line Plate). Maximum: Three. <) Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5 for Line Position Code and Transmission Mode Codes.

(Except Canada > 1200 bps Integrated Modem, Nonswitched (#2832%): <) (Except Canada > This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2-or 4-wire operation is made at installation time. Cable Orders: Required for attachment to external equipment. Maximum: Eight. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operation are possible. <) (Japan only > One specify code #2943 is required for each #2832 which attaches to NTT D-1 services. If two feature #2832s attach to NTT D-1 services, then two #2943s must be specified. This provides NTT Quick Disconnect and network wrap capability. (Start/Stop communications are not supported with NTT D-1 services.) <)

Communication Line Isolation (#2835): Provides an isolation barrier between the modems or Automatic Calling Units and the Communications Adapter, as required by certain WT Countries. Up to ten isolation barriers are available and may be used for one Remote Support Facility (#2833), up to two Autocall Unit Interfaces (#1020), up to eight EIA/CCITT Interfaces (#3701) up to two Data Link Adapters (#4840). Maximum: One. Cable Order: Required for each isolation barrier (up to 10). Field Installation: Yes. Prerequisites: Must be associated with at least one #2833, #1020 or #3701.

EIA/CCITT Interface (#3701%): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Non-Clocked Modems (#4696), then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. Maximum: Eight. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: One #4695 or #4696 is required for each feature #3701 installed. #2835 is required to permit attachment to PTT communications facilities in certain countries. Specify: Start/Stop, SDLC and/or BSC operations are possible. See Table 5 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General

Purpose Terminals 3104 Models B1, B2 and 8775 Models 1, 2, 3232 Keyboard Printer Model 11 and 3287 Models 11, 12 and/or Control Units 3274 Model 51C, 52C, 61C and 3276 Models 11-14 with the associated terminals to the 4331 Processors. Loop Adapter 1 and 2 (#4830, #4831) provide for direct attachment. A maximum of two Data Link Adapters (#4840) provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter (#4840) can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct-attached loops at 9600 bps or data link-attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments:

- 3104 Display Terminal Models B1, B2
- 3232 Keyboard Printer Model 11
- 3641 Reporting Terminal Models 1, 2
- 3642 Encoder Printer Models 1, 2
- 3643 Keyboard Display Models 2, 3, 4 including #4920 Badge and Document Encoder
- 3644 Automatic Data Unit
- 3645 Printer
- 3646 Scanner Control Unit
- 3647 Time and Attendance Terminal
- 8775 Display Terminal Models 1, 2
- 3287 Printer Models 11, 12
- 3274 Control Unit Model 51C, 52C, 61C with the associated terminals
- 3276 Control Unit Display Station Model 11-14 with the associated terminals

Control Units and Associated Terminals:

- 3274 Control Unit Model 51C, 61C
 - 3178 Display Station
 - 3179 Model 1 Color Display Station
 - 3179 Model G1, G2 Color Graphics Display Station
 - 3180 Display Station Model 1
 - 3191 Model A1X, B1X D1X, D3X Display Station
 - 3192 Model C1X, C3X, D1X, D3X, F1X, F3X Display Station
 - 3278 Display Station
 - (Canada only > 3270 Personal Computer - Control Unit Terminal Mode only. Specify #9843 on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer. <)
 - 3279 Color Display Station
 - 3262 Line Printer
 - 3268 Printer Model 2
 - 3287 Printer
 - 3289 Line Printer
 - Personal Computer XT/370 (5160 Model 589) (Control Unit Terminal Mode only) *
 - Personal Computer AT/370 (5170 Model 599 and 739) (Control Unit Terminal Mode only) *
 - 4234 Model 1 Dot Band Printer
 - 5150/5160/5170 PC with 3278/3279 Emulation Adapter
 - 5160 with XT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) *
 - 5170 with AT/370 Option Kit and 3278/79 Emulation Adapter (Control Unit Terminal Mode only) *
 - 5210 printer Models G01, G02
- 6580 Displaywriter System, Model A4, A6, A8, A10 (25-line display)
- 6580 Displaywriter System Model B4, B6, B8, B10 (66-line display)

* Specify #9843 on 4321 and 4331 must be ordered for attachment of the IBM Personal Computer AT/370 and XT/370.

- 3274 Control Unit Model 52C
 - 3178 Display Station
 - 3180 Display Station Model 1
 - 3268 Printer
 - 3278 Display Station
 - 3283 Printer
 - 3287 Printer
 - 4234 Model 1 Dot Band Printer

- 6580 Displaywriter System, Model A4, A6, A8, A10 (25-line display)
- 6580 Displaywriter System, Model B4, B6, B8, B10 (66-line display)
- 3276 Control Unit Display Station Model 11-14
 - 3178 Display Station
 - 3180 Display Station Model 1
 - 3278 Display Station
 - 3279 Color Display Station
 - 3262 Line Printer
 - 3268 Printer Model 2
 - 3287 Printer
 - 3289 Line Printer
 - 4234 Model 1 Dot Band Printer
- 6580 Displaywriter System, Model A4, A6, A8, A10 (25-line display)
- 6580 Displaywriter System, Model B4, B6, B8, B10 (66-line display)

In addition the following devices can be attached at 38,400 bps:

- 3104 Display Terminal Models B1, B2
- 8775 Display Terminal Models 1,2
- 3232 Keyboard Printer Model 11
- 3287 Printer Models 11, 12
- 3274 Control Unit Model 51C, 52C, 61C with the associated terminals

For the attachment of 3640 terminals it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

Cable length for direct-attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps. For data link-attached loops see 3843 Loop Control Unit. For details refer to GA23-0038, "IBM Multiuse Communications Loop Planning Guide".

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the "IBM Multiuse Communications Loop Planning Guide", GA23-0038, and "Installation Guide", GA23-0039. The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to "IBM 4331 Processor Loop Adapter Feature, Operating Procedures", GA33-1538, and "Problem Determination Procedures", GA33-1540.

Notes:

1. Loop "Accessories" are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See 4331-1 "Accessories" section for details and ordering information.
2. An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N 1657320. Communications Facilities: See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes (a lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C and/or 3276 Control Units or 38.4K bps for 3104 and/or 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: Adapter power prerequisite (#1001).

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes (a lobe is the actual physical Loop cable).

Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals, and/or 3274-51C, 52C, 61C and/or 3276 Control Units, or 38.4K bps for 8775 and/or 3232 Keyboard Printer Model 11 and/or 3287 terminals and/or 3274-51C, 52C, 61C control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: One. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: Loop Adapter 1 (#4830).

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4331 processor. The feature provides for the attachment of one external modem complying with EIA/CCITT recommendations. CCITT V.24/V.28 support will be provided for nonswitched lines only or a PTT-mandatory modem complying with CCITT recommendations. Transmission speed can be 2400, 4800, or 9600 bps, with half-speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link-attached loops. Support will be provided for the same terminals as on the direct-attached loop. Limitations: Can not be installed with 5424 adapter (#3901). Maximum: Two. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: Loop Adapter 1 (#4830). #2835 is required to permit attachment to PTT communications facilities in certain countries. (Japan only>One external cable (P/N 8482935) is required when attached to NTT or independent supplier modems in order to meet the self test requirements.<)

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 (#4830, #4831) or Data Link Adapters (#4840) has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Microcode Program Space Bytes	System Control Space Bytes
Microcode Base	42836	7880
One or multiple 3641 and/or 3647	7800	1060
One or multiple 3642	5900	580
One or multiple 3643 w/o #4920	8800	3450
One or multiple 3643 w/ #4920	9400	3450
One or multiple 3644	4900	-
One or multiple 3646	2900	256
One or multiple 3104 and/or 8775 and/or 3287, 3274, 3276, 3645	2600	-
Terminal* Control Space		
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 3104, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204

-----	-----
Total 1	Total 2

* For additional information on buffer space refer to the "IBM 4331 Loop Adapter Characteristics", GA33-1534.

The storage requirements need to be validated because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the 4331 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3876, an invalid configuration has been selected. A trade-off between features must be considered.

4331 Model Group 11 Processor Feature Facility	System Diskette Records
4331 Basic	3133
DAS Compatibility #7901	170
Start/Stop Transmission Mode #968X	20
BSC Transmission Mode #967X	24
SDLC Transmission Mode #969X	52
364X Terminal Att. #9251, #9252, #9253, #9254, #9256	665

The maximum number of system diskette records may not exceed 3876.

Maximum Number of Terminal Attachment Via Loop Adapters/Data Link Adapter: The maximum number of terminals that can be attached to the 4331 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 3104, 8775, 3232 Model 11 terminals or 3274-51C, 52C, 61C or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see "IBM Multiuse Communications Loop Planning Guide", GA23-0038.

Line Attach Base, Clocked Modems (#4695%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-Terminating Equipment) which provide clocking and comply with CCITT V.24/V.28, V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network (X.21bis support is available through features #3701 and #4720). See the various line features below to determine when it is required. Limitations: A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4695 installed reduces by one the number of feature #4696 allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

Line Attach Base, Non-Clocked Modems (#4696%): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-Terminating Equipment) which do not provide clocking. See the various features below to determine when it is required.

The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation. Otherwise, the clock speed can be wired at installation to one of the following:

Start/Stop: 75, 300, 600 or 1200 bps
BSC: 600 bps
SDLC: 600 bps

For BSC or SDLC operations, if 1200 bps is wired, then full-speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. Limitations: A maxi-

mum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4696 installed reduces by one the number of feature #4695s allowable. Maximum: Eight, one per line installed. Field Installation: Yes. Prerequisites: #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

High-Speed Modem Adapter (#4720%): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 64,000 bps. Limitations: For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see "IBM 4331 Channel Characteristics", GA33-1535. Cannot be installed with 231X DASD attached to the Block Multiplexer Channel. Cannot be installed with X.21 Adapter for Nonswitched Networks (#5655) if its speed is 48,000 bps #9831. Maximum: One. Cable Order: Required for attachment to the external modem. Field Installation: Yes. Prerequisites: #4695. Specify: BSC and/or SDLC operations are possible -- see Table 5 for Line Position Code and Transmission Mode Codes.

(Canada only) 1200 bps Integrated Modem, Nonswitched (#4781%): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. Cable Orders: Required for attachment to external equipment. Maximum: Eight. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem (#4782%): Switched with Auto Answer. This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network Start/Stop line via an integrated modem at speeds up to 300 bps and for BSC and SDLC at 600 and 1200 bps. Attachment to the switched network is via an IBM-provided cable to (<) (Canada only) > a Data Access Arrangement type CBS (or equivalent). (<) (Canada only) > Maximum: Eight. Cable Order: Required for attachment to external equipment. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem (#4787%): Nonswitched with Switched Network Backup and Manual Answer. This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and manual answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. Selection of 2- or 4-wire line operation is made at installation time. The cable group which is ordered also provides for attachment to a Data Access Arrangement type CDT or FCC-registered equivalent for manual answer. Maximum: Eight. Cable Order: Required for one cable group which connects to nonswitched line and to the switched network. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem (#4788%): Nonswitched with Switched Network Backup and Auto Answer. This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and auto answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. The same cable group provides for attachment to the switched network to a Data Access Arrangement type CBS or FCC-registered equivalent for auto answer. Maximum: Eight. Cable Order: Required for one cable group which connects to the nonswitched line

and to the switched network. Field Installation: Yes. Prerequisites: #4696. Specify: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.<.)

Local Attachment Interface (#4801%x): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the CE at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps
400 meters at 2400 bps
200 meters at 4800 bps
100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. Cable Order: Required for attachment to terminal plate. Customer-supplied cable for in door use. Maximum: Eight. Field Installation: Yes. Prerequisites: #4695. Specify: SDLC and/or BSC operations are possible, see Table 5.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. Limitations: If feature #5655 operates at 48,000 bps (specify #9831), then the following limitations apply: (1) High-Speed Modem Adapter (#4720) cannot be installed. (2) 231X DASD attached to the Block Multiplexer Channel (#1321) cannot be installed. (3) For speed limitations, refer to the Communications Adapter Base feature description. Maximum: Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. Field Installation: Yes. Prerequisites: One #4695 is required for each #5655 installed. Specify: SDLC operation must be specified for this feature -- see Table 5 for line position, transmission mode and transmission speed codes. Note: #9831(%x) is required for 48,000 bps operation. Cable Order: Required for attachment to external equipment.

Notes:

1. BSC or SDLC transmission mode with any line attachment feature.
2. Start/Stop transmission mode only with EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696) or with any other features offering 1200 bps Integrated Modems (with prerequisite #4696). (Japan only> Start/Stop transmission mode not available with NTT D-1 services (#2832 with #2943).<.)

3. Must be associated with EIA/CCITT Interface (#3701 and prerequisite #4695 or #4696). Maximum of two #1020s may be installed.
4. The aggregate data rate of the Communications Adapter is 64,000 bps -- Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage -- see Table 2 for microcode storage requirements.
5. May not be installed when 231X DASD is attached to the block multiplexer channel.
6. When changing #9444 to/from #9471, no new hardware or diskette is required.
7. Maximum of 3 can be installed; no line position limitation.
8. (Japan only) > One external cable P/N 8482935 is required for each #3701 which attaches to NTT or Independent-supplier modems. See Cable Order Form.<.)
9. (Japan only) > One specify code #2943 is required for each #2832 which attaches to NTT D-1 services. (If two feature #2832s attach to NTT D-1 services, then two #2943s must be specified.) This provides NTT Quick Disconnect and network wrap capability.<.)

Legend:

%x: Feature supplies diskette for System Diskette facility.

%z: System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette.

MODEL CONVERSIONS

- | * UPGRADES FROM 4321/4331 TO 4361 PROCESSORS ARE NO LONGER AVAILABLE.

Model Conversions within Model Group: Can be made in the field. Customer price quotations and customer order acknowledgement letters for purchase model conversions must state:

"Installation of this model upgrade involves the removal of parts which become the property of IBM."

Field upgrade from 4331 Model Group 1 to 4331 Model Group 11 is possible. The 4331 Model Group 11 can be field upgraded to 4331 Model Group 2.

Downgrades from 4331 Model Group 2 to 4331 Model Group 11 and from 4331 Model Group 11 to 4331 Model Group 1 are not recommended for field installation. Refer to "Equipment Orders" in the GI section of for details of this "Not Recommended for Field Installation" classification.

Field Upgrade from 4331 Model Group 1 to 4331 Model Group 2, refer to machine pages for 4331 Model Group 1 and 2.

Field Upgrade:

From 4331 Model Group 1 to 4331 Model Group 11: When a leased 4331 Model Group 1 is upgraded to the 4331 Model Group 11, features and specifications installed on the 4331 Model Group 1 which are not available on the 4331 Model Group 11 should be deleted with the upgrade MES order. Features installed on the 4331 Model Group 1 which are standard on the 4331 Model Group 11 should be deleted, i.e., changed to standard, for record purposes. Features which are standard on 4331 Model Group 11, but are not installed

on a leased 4331 Model Group 1 being upgraded, are automatically added to the configuration.

For upgrade of a purchased 4331 Model Group 1 to 4331 Model Group 11 features installed on the 4331 Model Group 1 which are not available on the 4331 Model Group 11 have to be removed. An RPQ has to be submitted listing each feature to be removed. There will be a charge for this RPQ. The features removed are the customer's property.

Standard features of the 4331 Model Group 11 not installed on the 4331 Model Group 1 must be ordered via RPQ with the upgrade MES. The 4331 Model Group 1 prices of these features are added to the model upgrade prices.

Standard features of the 4331 Model Group 11 already installed on a purchased 4331 Model Group 1 should be deleted, i.e., changed to standard, for record purposes.

Feature	Feature on 4331 Mdl Grp 1	RPQ for Adding to Mdl Grp 11
Block Multiplexer Channel	#1421	7B0811
Communication Adapter Base	#1601	7B0816
Control Storage Expansion	#1901	7B0697
Display/Printer Add'l Expansion	#2001	7B0813
DASD Adapter	#3201	7B0814
8809 Adapter	#4910	7B0815
Byte Multiplexer Channel	#5248	7B0810
Power Interface	#5531	7B0812

From 4331 Model Group 11 to 4331 Model Group 2: Standard features of the 4331 Model Group 11 which are to be retained on the 4331 Model Group 2 have to be included in the MES order using the individual feature and specify codes of the 4331 Model Group 2.

Order for the 4331 Model Group 2 Processor:

Block Multiplexer Channel	#1421
Communication Adapter Base	#1601
Display/Printer Add'l Expansion	#2001
DASD Adapter	#3201
8809 Adapter	#4910
Byte Multiplexer Channel	#5248
Power Interface	#5531
3340/3344 Direct Attachment (If required)	#7851
ECPS: VM/370 (VM assist) (if required)	#8701

Other features or specifies on the 4331 Model Group 11 are retained unchanged on the 4331 Model Group 2.

ACCESSORIES

See M4331-1 "Accessories" for additional information and field installation of Console Table (#1550), Book Rack and Cable Holder (#1480) and "Loop Accessories" and "Loop Cables".

SUPPLIES (NONE)

4341 PROCESSOR

(NO LONGER AVAILABLE ...features and model conversions can be ordered on an "as available" basis.

PURPOSE

Provides power, control, logic and memory circuitry for the arithmetic, logic and processor storage functions of the 4341 Processor.

MODELS

			Bytes of Processor Storage
Mdl Grp 9	Mdl Grp 10	Mdl Grp 1	
J9			1,048,576
K9	K10	K1	2,097,152
L9	L10	L1	4,194,304
Mdl Grp 11	Mdl Grp 2	Mdl Grp 12	
K11	K2	K12	2,097,152
L11	L2	L12	4,194,304
M11	M2	M12	8,388,808
	N2	N12	12,582,912
	P2	P12	16,777,216

Note: The microcode which controls system operations resides in Reloadable Control Storage and keeps dynamic tables in Processor Storage, thus reducing the amount of Processor Storage available for user programming. See "Microcode Storage Requirements" below for details.

Prerequisites: Each 4341 Processor requires one 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C and Operator Console Keyboard with an operator control panel.

Minimum System: See "Minimum Configurations" in "Systems" for minimum I/O units required for the 4341 Processor.

HIGHLIGHTS

From 2,097,152 to 16,777,216 bytes of monolithic processor storage depending upon the mdl -- see "Models" above.

Processor base cycle time in nanoseconds:

Mdl Groups		
Grp 9 150-300	Grp 10 150-300	Grp 1 150-300
Grp 11 120-240	Grp 2 120-240	Grp 12 115-230

8-byte parallel data flow within the processor as well as an 8-byte wide data flow between the processor, storage and channels.

Processor High-Speed Buffer storage in bytes:

Mdl Groups		
Grp 9 2,048	Grp 10 4,096	Grp 1 8,192
Grp 11 8,192	Grp 2 16,384	Grp 12 16,384

Buffer storage is transparent to the program and significantly reduces the effective access time of storage. Buffer storage does not

increase the amount of addressable storage. Extensive data checking, error recording by the hardware itself and remote maintenance are coupled with increased availability and serviceability.

Standard Features:

- Virtual Storage Capability by Dynamic Address Translation
- Byte and Block Multiplexer Channels
- Data Streaming Mode
- One-Level Addressing Facility for Improved Virtual Storage Control by DOS/VSE (ECPS:VSE Mode)
- Channels with Virtual Storage Addressing (ECPS:VSE Mode)
- 128-1024 UCWs
- Channel Indirect Addressing in S/370 Mode
- Channel Command Retry
- EC and BC Modes
- Byte Oriented Operands
- Clock Comparator and CPU Timer
- Control Registers
- Error Checking and Correction in Processor Storage
- Extended Control-Program Support for DOS/VSE, VS1, VM/370 and MVS
- Extended Precision Floating Point
- Interval Timer
- Machine Check Handling
- Support Processor
- Instruction Retry
- Program Event Recording
- Reloadable Control Storage
- Storage Protection (Store and Fetch)
- S/370 Universal Instruction Set
- System Diskette Drive
- Time-of-Day Clock
- PSW Key Handling
- Compare and Swap and Compare Double and Swap
- Clear I/O
- External Signal
- Unit Power Off
- Move Inverse Instruction (not software supported)
- Engineering Scientific Assist (Multiply Add facility) on Mdl Group 9, Mdl Group 10, Mdl Group 11, Mdl Group 2 and Mdl Group 12 Processors
- Fast Release for the Start I/O Fast Release Instruction for the Mdl Group 12

Modes of Operation: Two modes of operation are available. The mode is selected from a common diskette at Initial Microcode Load (IML) time.

- ECPS:VSE Mode - allows operation of an appropriately generated DOS/VSE system, offering potential for enhanced systems performance.
- S/370 Mode - allows operation of any program written for S/370 and S/360 that does not violate the exceptions noted under "Compatibility" below. Note: DOS/VSE in S/370 Mode will not operate on 12MB and 16MB models, except under VM/370. See the Programming Support Section for those SCPs which contain 4341 support. In this mode, two performance options and an MVS support option are available. These options are selected at IML time and are mutually exclusive on Mdl Group 9, Mdl Group 10, Mdl Group 1 and Mdl Group 11 processors. On Mdl Group 2 and Mdl Group 12 processors with ECPS Expansion Feature (#1601), ECPS:VM/370 and ECPS:VSE can operate concurrently.
- ECPS:VS1 - hardware assist that reduces the processor time needed to execute certain frequently used supervisor functions in OS/VS1, Release 7. The functional areas include:

IOS
SVC FLIH
System Trace
Page Management

Note: OS/VS1 Release 7 with or without OS/VS1 Basic Programming Extension will operate on 12MB and 16MB mdl's, but the SCP will only access up to 8MB. However, when OS/VS1 runs as a guest SCP under VM/370 and the VM Handshaking feature is specified, an OS/VS1 system can utilize up to 16MB.

- ECPS:MVS - hardware facility that provides 14 privileged instructions necessary to allow the 4341 processor to be supported by the MVS System Product - JES2, 5740-XYS, and MVS/System Product - JES3, 5740-XYN. The instructions involve the following MVS functional areas:

- SVC Interrupt Handling
- Integrity
- Tracing
- Lock Management
- Real Storage Management

On Mdl Group 2 and Mdl Group 12 processors, the ECPS:VSE hardware facility is extended to include the dual address space facility a function supported by MVS/System Product-JES2 Release 3 and MVS/System Product-JES3 Release 3 and defined in IBM System/370 Principles of Operation, GA22-7000-7. This extension facilitates communication among address spaces in an MVS/SP environment. In addition, the extensions include the ADD FRR instruction and the Page Fault Assist function, defined in IBM System/370 Assists for MVS, GA22-7079-1.

- ECPS:VM/370 - hardware assist that reduces the processor time needed to execute certain frequently used supervisor functions in VM/370 Release 6. The functional areas include:

- Virtual Machine I/O
- Storage Management
- SVC Handler
- Privileged Instruction Emulation
- Dispatching
- Virtual Interval Timer

On Mdl Group 2 and Mdl Group 12 processors, whenever ECPS:VM/370 and ECPS:VSE are both selected at IML time, ECPS:VM/370 is enhanced to include the functions of the Shadow-Table Bypass Assist defined in Virtual Machine Assist and Shadow-Table-Bypass Assist, GA22-7074. These functions are defined to enhance the performance of MVS running under VM/370 in a V=R environment with VM System Extensions Release 2 or VM/System Product. (#1601, ECPS Expansion Feature is required.)

The Engineering/Scientific Assist can be used in both modes of operation.

Control Storage Requirements: (Mdl Group 2 and 12) ECPS Expansion Feature (#1601) is required to support concurrent operation of ECPS:VM/370 and ECPS:VSE.

System Diskette Drive: This is the basic microcode loading device for the system. The several removable diskettes that will be sup-

plied with the system will contain all of the required microcode for CE diagnostics, basic systems features, plus the optional features ordered for the system. The System Diskette File also allows recording of system failure data for later CE diagnostics.

In addition, the system diskette file provides automated Problem Analysis for use by console operators and system programmers. Basic data are collected and analyzed. Messages are displayed which describe system problems or status and suggest corrective actions. Options are included for sending service information to IBM via RSF and for running an additional processing unit analysis test when required.

Console Function: A 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C and Operator Console Keyboard with an operator control panel is required. It is the principal device provided for the operator to communicate with the system. The operator may use the keyboard and the display to control the system operation as well as to display the status of the system. The primary Operator Console Keyboard includes the operator control panel. The 3278 mdl 2A and 3279 mdl 2C has a screen size of 1,920 characters, 24 lines at 80 characters per line. The bottom four lines (lines 21-24) are reserved for system status information and are not accessible to the user. 3278/3279 features other than those basic to the primary console display/keyboard are not supported. Up to three optional (for a total of four) 3278 Operator Display Consoles mdl 2A or 3279 Color Operator Display Console mdl 2C or 3268 Printer mdl's 2 and 2C or 3287 Printers mdl 1, 2, 1C or 2C for hard copy output are also available in any combination.

Two console modes are available -- "Display Mode" and "Printer-Keyboard Mode". In "Display Mode", the keyboard is used for input, the display with 20 lines of 80 characters/line for output, and DOS/VSE, OS/VS1 Release 7 to VM/370 Release 6 or MVS Release 3.8 with the MVS/System Product-JES2 or MVS/System Product-JES3 support is required. The optional 3268 Printer mdl's 2 and 2C or 3287 Printer mdl 1 or 2 has a separate address. In "Printer-Keyboard Mode", the 3278 mdl 2A Display Console or 3279 mdl 2C Color Display Console uses the keyboard for input and the display and a recommended 3268 Printer mdl's 2 and 2C or 3287 Printer mdl 1 or 2 or 3287 Color Printer mdl 1C or 2C for output. The display/keyboard and 3268 Printer mdl's 2 and 2C or 3287 Printer mdl 1 or 2 or 3287 Color Printer mdl 1C or 2C appear to the system as a Console Printer-Keyboard. This allows the 4341 Processor user to run an operating system which has been generated for use on a S/360 with a 1052 typewriter keyboard console or a S/370 with a 3210 or 3215 console.

Channels Mdl Group 9, Mdl Group 10 and Mdl Group 1: Six channels in two groups are available. Group 1 (standard) consists of 1 byte multiplexer channel and 2 block multiplexer channels. Group 2 (optional) consists of 3 block multiplexer channels. One of the 2.0 million byte per second block multiplexer channels in the second group (channel 4) can be optionally selected as an additional byte multiplexer channel.

The following table shows the Block Multiplexer speed in million bytes per second for the following Mdl Groups:

Mdl Group 1, 9, 10

	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	-	-	-	6

MACHINES

Option 2	byte	3	3	2	2	1	11
Option 3	byte	3	3	2	byte	1	9

Channels Mdl Group 11, Mdl Group 2 and Mdl Group 12: Six channels are standard, consisting of one byte multiplexer channel and five block multiplexer channels. One of the block multiplexer channels can be optionally selected as an additional byte multiplexer channel.

The following table shows the Block Multiplexor speed in million bytes per second for the following Mdl Groups:

Mdl Group 2, 11

	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	2	2	2	12
Option 2	byte	3	3	2	byte	2	10

Mdl Group 12

	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	2	3	2	13
Option 2	byte	3	3	2	3	byte	11
Option 3	byte	3	3	2	byte	2	10

Data Streaming Mode can operate on any 4341 block multiplexer channel up to the maximum data rates specified above.

The capability for the attachment and automatic I/O power sequencing of up to 24 separate control units is standard. Optionally, 48 control units can be attached. An optional Channel to Channel Adapter is also available.

Compatibility: Any program written for S/370 will operate on the 4341 Processor in S/370 Mode, provided that it (1) is not time-dependent, (2) does not depend on system facilities (storage size, I/O equipment, optional features, etc.) being present when the facilities are not included in the configuration, (3) does not depend on system facilities (such as operation codes) being absent when the facilities are included in the 4341 Processor, and (4) does not depend on results or functions which are defined in the Principles of Operation to be unpredictable or model-dependent.

Any program written for S/360 will operate on the 4341 Processor in S/370 Mode, provided that it follows the above rules and does not depend on functions that differ between S/360 and S/370.

Any program written for the 4331 Processor in ECPS:VSE Mode or S/370 Mode will operate on the 4341 Processor, provided it follows the above rules. Note: DOS/VSE and prior DOS releases in S/370 Mode will not operate on the 4341 12MB and 16MB models, except under VM/370.

For more details, see S/370 Principles of Operation, GA22-7000, or 4300 Processors Principles of Operations for ECPS:VSE Mode, GA22-7070.

Microcode Storage Requirements: The microcode which controls system operations resides in Reloadable Control Storage and

keeps dynamic tables in Processor Storage, thus reducing the amount of Processor Storage available for user programming. The amount required is the sum of Processor Storage required by two user selectable options: (1) the number of Unit Control Words (UCWs) selected, and (2) the mode of operation.

1. Number of UCWs:

128 UCWs are basic on the 4341 and require 8,192 bytes of Processor Storage. Additional UCWs are allocated as required in groups of 32, each group requiring an additional 2,048 bytes of Processor Storage. The maximum number of UCWs on 4341 is 1,024.

UCW assignment is user-dependent. It is the customer's responsibility to designate desired I/O addresses and configurations to service personnel. Channel configurations should be reviewed during pre-installation planning for new systems and when additional I/O devices are attached or existing equipment is reconfigured.

For specific device requirements, see the appropriate machine pages.

2. Depending on which mode of operation is selected at IML time, processor storage will be required as follows:

	Mode of Operation	
	ECPS:VSE Mode (bytes)	S/370 Mode (bytes)
4341 J9 K1 K2 K9 K10 K11 K12	49,152	10,240
4341 L1 L2 L9 L10 L11 L12	51,200	10,240
4341 M2 M11 M12	55,296	10,240
4341 N2 N12	59,392	10,240
4341 P2 P12	63,488	10,240

Publications: GC20-0001

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

● Power (AC, 3-phase, 4-wire):

50 Hz	60 Hz
200V #2807	200V #2733
220V #2815	208V #9903
380V #2816	220V #2800
400V #2825	240V #9915
415V #2826	

● Machine Nomenclature:

Canadian French #2935
English US #2924
Portuguese (Brazil) #2933
Spanish #2931

● Cabling: For the primary console with Operator Control Panel (OCP) signal and control cables are shipped with the processor. 7.6m (25 feet) is standard. Cables longer than 7.6m (25 feet), up to a maximum length of 45.6m (150 feet) may be obtained by RPQ. Each additional console device (without OCP) requires a cable order. For cable order information, refer to the 4300 Processor Installation Manual - Physical Planning, #GA24-3667.

● Color: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9063 for classic blue, #9064 for charcoal brown, #9065 for pebble gray. Note: #9061, #9062, #9063 are

slightly different colors from those available on previous machines.

- Dimensions: The normal dimensions of the larger of two 4341 Processor frames are 62-3/4" x 32" x 39-1/2". Dimensions can be reduced to 60" x 29-1/2" x 38-1/2", if required, by local customer engineering. No materials need to be ordered.
- Remote Support Facility: The Remote Support Facility utilization (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4341 Processor. It provides service personnel the capability of remotely controlling the 4341 from any RETAIN terminal and allows the IBM CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF Modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network.

For All Countries except Japan and Canada: When specified, each 4341 Processor will be equipped with either a CCITT Interface or 1200 bps Integrated Modem (switched network, manual answer) for the Remote Support Facility (RSF). Specify #2838 for CCITT Interface or #2836 for 1200 bps Integrated Modem, switched network, manual answer.

For Canada: Specify #9510 for integrated modem, 1200 bps, switched network, manual answer. A telephone set with exclusion key and with Data Access Arrangement (DAA), compatible with CDT Type Coupler Series 1000A interface and operation, is required.

For Japan: Each 4341 Processor requesting RSF will be equipped with either a CCITT Interface or 1200 bps Integrated Modem. Specify #2838 for CCITT Interface for Acoustic Coupler. Specify #2944 for 1200 bps Integrated Modem. Also specify #2943 for the NTT CA-2 Modem service cable connector.

If Remote Support Facility is not desired, no specify code is required.

- Remote Operator Console Facility: The Remote Operator Console Facility (ROCF) is an extension of RSF. It gives personnel at a host site the ability to dial-up and control a remote 4341 by means of a 3275 mdl 2 Display Station or by means of host site programming support.

For All Countries Except Canada and Hong Kong: Specify RSF feature #2836 for an Integrated 1200 bps Modem with auto answer capability or #2838 as CCITT interface. CCITT interface is for attaching customer-supplied or PTT mandatory modems meeting CCITT recommendation V.23/V.24/V.28. The customer-supplied modem must include auto answer.

For Canada: Specify #9511 for EIA-Interface, 1200 bps, switched network. This feature is used by both the RSF and the ROCF functions. An external modem compatible with the WE202S modem, interface and operation, or equivalent is required. The external modem must include auto answer.

For Hong Kong: Specify RSF feature #2838 as CCITT interface and feature #2839. This interface is for attaching customer-supplied or PTT mandatory modems meeting CCITT recommendation V.23/V.24/V.28. The modem must include auto answer.

Note: Feature code #2836 operates in manual mode when used with RSF and Auto Answer mode when used with ROCF.

SPECIAL FEATURES

ECPS Expansion (#1601): (Mdl Group 2 or 12) Adds 16,384 bytes of control storage. See "Control Storage Requirements" under "High-lights" for details. Maximum: One. Field Installation: Yes. Field installation of #1601 involves the removal of parts which become the property of IBM. Prerequisites: A 4341 Mdl Group 2 or Mdl Group 12 Processor.

Channel-To-Channel Adapter (#1850): One channel to channel feature is optionally available to interconnect two channels (4300 Processor, S/360, S/370) - one of the processors requires this feature - requires one control unit position on each of the connected channels. (If a 4381 Processor is one of the machines connected via a channel-to-channel adapter, three control unit positions are required on each processor.) Maximum: One. Field Installation: Yes. Prerequisites: (1) #4631 must be specified on the primary 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C. (2) One control unit position on a block multiplexer channel. (Three positions required on the 4381 and each processor connected to it.) Specify: Feature code #2727, 76-Key Japanese English Operator Console Keyboard Channel-to-Channel, may be specified on the primary 3278 mdl 2A or 3279 Color Display Console mdl 2C in lieu of #4631.

Block Multiplexer Channels Add'l (#1870): (Mdl Group 9, 10, 1) An optional group of three block multiplexer channels permits simultaneous operation of high speed devices at a data rate of 2.0MB/second for two channels and 1.0MB/second for one channel. One of the 2.0 million byte per second block multiplexer channels in the second group (Channel 4) can be optionally selected as an additional byte multiplexer channel at installation time. Limitations: Not available on 4341 Mdl Group 2, 11, or 12 since five block multiplexer channels are standard. If installed on a 4341 Mdl Group 1, 9, or 10, this feature designation should be deleted with the order entry for conversion to a 4341 Mdl Group 2, 11, or 12. This is for order entry purposes only. The channels are not physically removed when upgrading. Maximum: One. Field Installation: Yes. Prerequisites: A 4341 Mdl Group 1, 9, or 10 Processor.

Channel Control Unit Positions, Add'l (#1890): This feature is required for the automatic I/O power sequencing of more than 24 control units from the 4341 Processor. Standard on the 4341 is the capability to attach up to 24 control units, not to exceed eight per channel. With this feature, 25 to 48 Control Units may be attached and automatically powered up, not to exceed eight per channel. Maximum: One. Field Installation: Yes. prerequisites: #1870 on Mdl Group 9, Mdl Group 10 or Group 1 Processor.

MODEL CONVERSIONS

The following field upgrades are possible:

- Model Group 10 to Model Group 11
- Model Group 1 to Model Group 2
- Model Group 1 to Model Group 11
- Model Group 10 to Model Group 12
- Model Group 1 to Model Group 12
- Model Group 11 to Model Group 12
- Model Group 2 to Model Group 12
- Model Group 9 to Model Group 10

See Block Multiplexer Channels, Add'l (#1870) in "Special Features". Customer price quotations and customer order acknowledgment letters for purchase MESSs must state: "Installation of a model upgrade and special feature additions involves the removal of parts which become the property of IBM." Other model changes and storage downgrades are not recommended for field installation.

Model Upgrade: RPQ S00468 is required for upgrade of purchased 4341 Mdl Group 10 or 4341 Mdl Group 1 when Block Multiplexer Channels Add'l (#1870) is not installed on the machine to be upgraded.

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with machine, order the P/N indicated below.

Bookrack and Cable Holder (#1480): Provides a storage rack for use with Console Table (#1550) only. Up to four racks can be mounted on one table.

Console Table, 4300 Processors (#1550): Provides a convenient workstation table to support one or two 3278 mdl 2As/3279 mdl 2Cs.

SUPPLIES (NONE)

4361 PROCESSOR MODEL GROUPS 3, 4, 5

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the Processor Central Electronic Complex including I/O channels and integrated device adapters.

HIGHLIGHTS

The 4361 Processors are designed as one physical unit including all channel and attachment functions, and the service processor.

Model Group 3:

- Processing unit for instruction processing and control of I/O operations with:
 - Floating-Point multiply hardware accelerator (optional feature available at time of manufacture only) using high speed array multiplier logic. It improves floating-point multiply instruction execution times by a factor of 3 to 8 over microcode implementation.
 - Microcode assisted execution of functions supported in the Elementary Math Library (EML PRPQ P81005, 5799-BTB) to improve the performance of engineering/scientific programs.
 - Processor storage of 2 or 4 megabytes.

Data flow is four bytes parallel. Processor fetch from the cache is in two cycles of 100 nanoseconds each for four bytes. The cache is automatically replenished from main storage in 64-byte blocks. The

64-byte fetch cycle requires 2.6 microseconds, the store cycle requires 3.6.

Model Groups 4 and 5:

- Instruction processing unit with:
 - Implementation of frequently used instructions in hardware rather than in microcode.
 - Floating-Point multiply hardware accelerator using high speed array multiplier logic. It improves floating-point multiply instruction execution times by a factor of 3 to 8 over microcode implementation.
- Channel processor which controls integrated I/O attachments and the I/O interface channels. It operates concurrently with the instruction processing unit for maximum throughput.
- Processor storage from 2 to 16 megabytes.
- Support of the Start I/O Fast Release instruction with queuing of I/O requests on the model group 5.

Data flow is four bytes parallel within the processors and eight bytes parallel between the processors and main storage. Processor fetch cycles from the cache are 100 nanoseconds each for four bytes. The cache is automatically replenished from main storage in 64-byte blocks. The 64-byte fetch cycle requires 1.9 microseconds, the store cycle requires 2.2.

All Models:

- Service processor which controls the operator console, the maintenance and service functions and the locally attached displays, printers, and diskette drive.
- High-speed cache buffer storage with 100 nanoseconds cycle speed (8Kb on model groups 3 and 4, 16Kb on model group 5).
- High-speed reloadable control storage.
- A High-Accuracy Arithmetic Facility that allows computational procedures with, where possible, maximum accuracy (as defined below) and algorithmic verification of results.
- Programmable power-off via Diagnose instruction that allows shut-down of the processor under program control.

Microcode: The microcode, controlling systems operations resides in reloadable control storage and processor storage. Approximately 270K bytes (model group 3) or 350K bytes (model groups 4 and 5) of processor storage are occupied by microcode, RAS workspace and system data. The approximate processor storage available to the user is obtained by subtracting 270,000 or 350,000 bytes from the nominal storage size of a given model. When directly attached 3340 or DAS Compatibility is used (in model groups 4 and 5 only), approximately 100K of additional storage is required for I/O buffers.

The system diskette facility is the microcode loading system for the 4361 Processors. The facility includes two diskette drives, and the second is available to the user after initial microcode loading. The diskettes shipped with the processor supply the microcode for diagnostics, standard functions, and the optional features. The facility is also used for the recording of log data for analysis by the customer engineer, and for the Problem Finder (PROFI) facility.

Operational Modes: The 4361 Processor operates in either S/370 mode or in Extended Control Program Support ECPS/VSE mode. The mode is selectable at Initial Program Load (IPL) time.

ECPS/VSE supports operation of an appropriately generated VSE or SSX/VSE system. S/370 mode allows operation of VSE, VM/370, VS1 or MVS (MVS on model group 5 only).

STANDARD FUNCTIONS

High-Accuracy Arithmetic Facility (ACRITH): The High-Accuracy Arithmetic Facility is included. New floating-point instructions are implemented in the 4361 for computation of the basic arithmetic operations (+, -, x, /) and the scalar (dot) product with maximum accuracy, providing directed rounding (up, down, to nearest, to zero) for the short and long floating-point hexadecimal formats. Maximum accuracy means, there is no floating point number between the exact result (at infinite precision) and the rounded result.

The Program Product, High-Accuracy Arithmetic Subroutine Library (ACRITH), provides subroutines which can be called from VS FORTRAN or Assembler in the environments of VM/SP, VSE/SP, and VM/PC on the Personal Computer XT/370. On the model group 5 it is also supported under MVS/SP.

Attachment Capability for Intelligent Workstations: Attachment of intelligent workstations to the Display/Printer Adapter (DPA) or to the new Workstation Adapter (WSA), or to a channel via a 3274 control unit or via the 4994 ASCII Controller, or to the Communications Adapter is as follows:

No.	Attachment Via:	DPA	WSA	Control Unit	CA Protocol
1	6580 Displaywriter System	Yes	Yes	3274	All
2	3270 Personal Computer (5271) and 3270 PC/AT (5273)	Yes	Yes	3274	---
3	PC with 3270 Emulation	---	---	---	BSC/SDLC
4	PC with 3101 Emulation	---	---	4994/7171	S/S
5	PC XT/370 and PC AT/370	Yes	Yes	3274	---
6	PC and 6150, 6151 with 3278/3279 Emulation Adapter	Yes	Yes	3274	---
7	3270 PC Attachment to 3278/3279	Yes	Yes	3274	---
8	3270 PC/G, PC/GX and AT/G, AT/GX	---	Yes	3274	---

Description of numbered items above:

- 1. The 6580 Displaywriter System can be attached directly to the 4361 via the DPA, the WSA or remotely connected via the Communication Adapter. These attachments provide additional capability for office applications. Several emulation features on the Displaywriter enable access to S/370 host environments.
- 2. The 3270 Personal Computer (5271) provides multiple simultaneous applications, PC or host, sharing one physical screen. A new screen management enables dynamic placement and alterations of application view areas. Utility programs for the workstation and for VSE/SP, SSX/VSE, VM/CMS and MVS/TSO provide functions like: bidirectional file transfer, screen copy, keystroke recording, translation between ASCII and EBCDIC and more.
- 3/4. The Personal Computer (all models) can attach directly to the 4361 via the Communication Adapter. With the appropriate PC features the following devices can be emulated: 3101 and TTY terminals, 3268-2, 3275-2, 3276-2, 3277-2, 3278-2, 3279-2A, 3284-2/3, 3287-2, 3288-2 and 3770.
- 5. The Personal Computer XT/370 (5160) or AT/370 (5170) can be attached via the Display Printer Adapter, Workstation Adapter and the 3274 Control Unit. Only the Control Unit Terminal (CUT) mode is supported. This feature provides a single-user CMS environment allowing execution of many S/370 programs in the Personal Computer. Access to host applications in 3270 mode is also supported. In addition to both of the above modes all the functions of a standard PC are available.
- 6. The Personal Computers (5150, 5160, 5170, 6150, 6151) with the 3278/3279 Emulation Adapter provides native PC operation concurrent with 3278/3279 emulation using a 'hotkey' to switch between modes. File transfer capability is the same as for the 3270 Personal Computer (Item 2 above).
- 7. The 3270 Personal Computer Attachment utilizes the 3278/3279 display monitor and keyboard together with the PC system unit providing concurrent operation of host and PC programs. This configuration, however should not be confused with the 3270 PC (5271) and its advanced function. Furthermore, the file transfer function from PC to host and screen capture functions to PC printer or diskette are supported only if the 3278/3279 is attached via the 3274.
- 8. The 3270 PC/G, PC/GX AT/G, AND AT/GT workstations add new displays and display attachment units specially suited for

graphics functions with powerful interactive and output graphics capability.

Serial OEM Interface (SOEMI): This interface can be used to attach a variety of non-IBM subsystems and devices to the DPA/WSA. A protocol based on structured fields is implemented in microcode and can be used by standard S/370 I/O instructions, providing the user full programming flexibility. OEM adapters are required to attach the subsystems and devices to the SOEMI in order to provide the appropriate conversions and control functions. Examples are the attachment of subsystems based on board-level macrocomputer devices using non-IBM standards, e.g., IEEE 796. The DPA supports up to two SOEMI adapters with an aggregate data rate of up to 17K bytes/second (inbound) or 30K bytes/second (outbound), the WSA supports up to four SOEMI adapters with an aggregate data rate of up to 22K bytes/second (inbound) or 45K bytes/second (outbound).

Console Function: An operator's display console, keyboard, and control panel is a prerequisite for use of the system. The display console can be a 3278 model 2A, a 3279 model 2C (color) with keyboard feature #4634, or a 3205 model 1 (color). The operator display console should be close to the processor to assure legibility by the CE working on the processor.

Note: A new integrated operator control panel (IOCP) is required for attachment of the 3205. The IOCP will be available on all new 4361 processors shipped after (Canada only > March 31, 1985.) (Except Canada > April 30, 1985.) For 4361 processors shipped prior to that date or for 4331s upgraded to 4361s, RPQ 7B0987 must be ordered for field installation.

A maximum of 20 of the 25 lines on the display may be used for system communication; four lines are reserved for messages from the 4361 Processor, and one line displays messages unique to the 3278 model 2A or the 3279 model 2C. The console address is selected at system installation time. Note: Certain MVS components, such as DCCF require output to a 24-line display. In these cases, an alternate console must be assigned to a terminal other than the operator console.

The console can operate in "Display Mode" or in "Printer/Keyboard Mode".

- Display Mode, the keyboard is used for input and the CRT, with 20 eighty-character lines, is used for output. The 3287 or the 3268 Printer, if attached, has its own address and is supported as an independent device.
- In Printer/Keyboard Mode, the console and an optional printer have a single address, and operation is in single-line mode

MACHINES

compatible with the 1052/3210/3215 devices of the older S/360 and S/370.

Printer/Keyboard Mode is selected at IPL time and is exclusive with the 4250 Image Printer operation and with SOEMI operation on the DPA. (Japan only) It is also exclusive with certain language options of devices attached to the Display/Printer Adapter (example Katakana).<)

Remote Operator Console Facility (ROCF): ROCF is an extension of the Remote Support Facility (RSF) that enables an operator at a host location to IML/IPL a remote 4361 and execute other manual control functions via a 3275 display station, or via a 3275 emulated on a host attached 3270 or emulated on a Personal Computer.

Programmable Power-Off: A programmable power-off function is available via a S/370 diagnose instruction. It enables the user to power-off the processor under program control. In VM/SP 1.4 and SSX/VSE 1.4 this function is supported in the shut-down routine which orderly ends all system tasks and then powers-off the processor. In VSE/SP 2.1 a user interface is provided with which the user can program the power-off function.

MAINTENANCE FACILITIES

Remote Support Facility (RSF): An IBM Customer Engineering tool provided by the Service Processor. Installation of the co-requisite communications interface is a no-charge customer option. RSF permits the IBM Customer Engineer, after customer authorization, to manually establish a connection to a RETAIN terminal at a remote IBM support location. Specialists can, from there, monitor and/or perform problem diagnosis on the 4361. This includes remotely initiated execution of diagnostic programs, remote examination of logout records from the system diskette facility, and remote exercise of the customer manual operations. RSF also allows the customer engineer to access the RETAIN data bank for the latest service aids and information from the customer site.

Problem Finder Facility: This is a function of the service processor. It provides the customer with detailed information about what to do in case of system malfunctions. It also contains procedures which enable the operator to diagnose and solve certain problems before calling for service. When customer engineering service is necessary, the customer reported error data allows the customer engineer to identify suspected FRUs remotely. This may eliminate

on-site analysis and wait time for required parts, resulting in reduced system outage time.

Other Standard Functions:

- Multiple Virtual Storage capability by two-level Dynamic Address Translation in S/370 mode
- Single Virtual Storage by one level addressing in ECPS/VSE mode
- Channel Indirect Data Addressing in S/370 mode
- Channel Virtual Storage addressing in ECPS/VSE mode
- S/370 Universal Instruction Set
- Extended precision floating-point arithmetic
- Multiply-and-Add instruction (provided for compatibility purposes)
- Floating-point multiply accelerator (optional on model group 3)
- Support of the Start I/O Fast Release instruction with queueing (on model group 5 only)
- Clock Comparator and CPU Timer
- Time-of-Day Clock
- Interval Timer
- Machine Check Handling including Recovery Extension Feature
- Command retry on block multiplexer channels
- Move inverse instruction (not used by IBM programs)
- High-speed buffer storage (Cache): model group 3 and 4, 8Kb; model group 5, 16Kb

STANDARD PROCESSOR FEATURES

The 4361 includes many 4331 features as standard. The table below, contains all 4361 model groups for comparison. 4331 feature numbers are provided for reference. The second part of the table lists the new 4361 features.

Feature	Equivalent 4331 Optional Feature	On Model Grp 3 4 5		
Adapter Power Prerequisite	#1001	S	S	S
Block Multiplexer Channel, 1st	#1421	O	S	S
Block Multiplexer Channel, Add'l	#1422	N	O	S

Legend:
S Standard
O Optional
N Not available
I Part of feature #1100 in model group 3

Floating-Point Multiply Accelerator: Standard on model groups 4 and 5, optional on model group 3. Executes frequently used floating-point multiply instructions in VSLI gate array hardware rather than in microcode, resulting in an improvement of execution speed for these instructions by a factor of three to eight. When this feature is installed in model group 3 (factory installation only), mathematical functions supported in the Elementary Math Library (EML PRPQ P81005, 5799-BTB) are assisted by microcode to improve performance. The EML PRPQ provides subroutines that can be called from VS Fortran in the VM/SP environment. The following functions are microcode assisted: square root, logarithm (ln, log), exponentiation, sine, cosine, arctangent, power.

Block Multiplexer Channel: Standard on model groups 4 and 5, optional on model group 3. Operates at up to 1.25M bytes/second for the attachment of tape units, system printers, displays and other non-DASD I/O via their control units.

Byte Multiplexer Channel: Standard on model group 5, optional on model groups 3 and 4. Operates at up to 26K bytes/second in single

byte-mode and 500K bytes/second in burst mode. It is primarily for the attachment of unbuffered card readers and MICR and OCR devices.

Power Interface: Provides power-on/off control from the 4361 Processor for control units/devices attached to 4361 channel and I/O adapters. Model groups 3 and 4 control for up to eight control units/devices, and the model group 5 for up to 16.

External Signals: Provides six external interrupt lines.

Diskette Drive: Compatible with the 3540 as a reader/recorder for Diskettes Type 1. It is required during system start-up for micro-code loading and when the Problem Finder Facility is used.

Display/Printer Adapter: Attaches the 3205-1 color operator console, the 3278-2A operator console or the 3279-2C color operator console, and the following displays, printers and other devices:

3178-C1,C2	Display Station

* The 3180-1 is supported only when it is emulating a 3278 model 2. The 3180 extended functions, APL and larger screen formats are not supported. See Workstation Adapter.

Note: See "Display/Printer Adapter" in Input/Output Attachments -- Additional Information section, and "Display/Printer and Workstation Adapter -- Additional Information" for more information.

OPTIONAL FEATURES

Block Multiplexer Channel: Optional on model group 3.

Auto Start: With this feature the processor can be powered-on by telephone call via the Remote Operator Console Facility (ROCF) (here an external modem with autoanswer is required), or automatically at a predetermined time and day of the week. A 'Manual Operation' menu is provided at the operator console to preset the time and day of the week. Each day of the week may be associated with a different power-on time. The processor powers-on and proceeds with initial program load, sets the TOD clock from a battery-operated clock, and then IPLs the system. This automated system bring-up is supported by VSE/SP 2.1, SSX/VSE 1.4.0, and VM/SP 1.4. The bring-up sequence is also followed after an AC power outage upon return of power with option to suppress IPL to prevent uncontrolled restarts. IPL after an uncontrolled shut-down may need operator intervention.

An additional clock is implemented in the processor to sustain time and date during power-off periods. During normal power-off this clock is powered by an additional stand-by power supply. In case of a power outage or if the processor is disconnected from the power net, a battery with a life time of approximately four years supplies the clock. The battery can be changed while the system has power on or off without losing the time and date or without interfering with the system. This feature will be available for 4361s shipped from the beginning of April 1985. For field installation an MES will be available by October 1985. Field installation on 4361s shipped prior to April 1985 or 4361s upgraded from 4331s, require RPQ 7B0987 as prerequisite.

Floating-Point Multiply Accelerator: Optional on model group 3.

Byte Multiplexer Channel: Optional on model groups 3, 4.

DASD/8809 ADAPTERS AND HIGH-SPEED CHANNELS

Integrated DASD/8809 adapters and high-speed BMPX channels are available to attach high performance DASD, tapes, and other I/O devices. These adapters and channels are available in several combinations to provide the I/O configurations required to support a range of programming systems and customer environments.

DASD/8809 Adapters: Operate at up to 1.86M bytes/second for the attachment and control of 3310, 3370, and 3340/44 DASD or the 8809 Magnetic Tape Unit. The 3310 and 3370 operate in fixed-block data format and provide emulation of Count-Key-Data (CKD) data formats. Restrictions on model group 3: The 3340/44 attachment and CKD emulation (DASD Compatibility) is not supported. 8809 attachment is limited to the second adapter.

High-Speed BMPX Channel: On model group 3 one operates at up to 1.86M bytes/second. On model groups 4 and 5 two are included which operate at up to 3M bytes/second for the attachment of the 3880/3380 DASD. On model groups 4 and 5, a third operates at up to 1.86M bytes/second. Attachment of 231X, 333X, 334X, 3350, and 337X DASD, and other I/O devices via control units is supported.

Workstation Adapter: Provides 32 ports via 3299 Terminal Multiplexers to attach the following devices and workstations. When installed, the number of ports on the DPA reduces to eight. Prerequisites: Each group of eight ports requires one 3299-1.

Communications Adapter: Attaches up to eight communication lines with an aggregate data rate of 64K bps. BSC, SDLC, HDLC (LAPB) for X.25 lines, and Start/Stop transmission modes are supported and can be intermixed. In Start/Stop mode, IBM TC1 and TWX/TTT2 devices are supported, with connection via the EIA RS-232-C interface.

Additional Optional Features: Include most of those available on the 4331 Processors. Exceptions are the 5424 Adapter, 1400 Compatibility, integrated modems for the communications adapter, and the R-Loop. On model group 3, DASD compatibility is also not available.

INPUT/OUTPUT ATTACHMENTS - ADDITIONAL INFORMATION

External Signals: External devices must meet the interface specifications outlined in S/360 Direct-Control Feature OEMI (GA22-6845).

Byte Multiplexer Channel: Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. The channel permits simultaneous operations of low-speed devices. See "IBM 4361 Channel Characteristics" (GA33-1567) for devices which may be attached.

Channel Address and Subchannels: The Byte Multiplexer Channel, the Display/Printer Adapter and the Communications Adapter are addressed via channel 0. From the 256 subchannel addresses of channel 0, up to 24 are assigned to the Display/Printer Adapter. 8, 16 or 24 addresses are used by the DPA, the range is variable. If the WSA is installed, 64 addresses are reserved for the WSA with a fixed address range of 40-7F. If the CA is installed, 16 addresses are reserved for the CA with a fixed address range of 30-3F. The subchannels remaining for the Byte Multiplexer Channel can be configured at installation time as non-shared or shared subchannels, the latter each with devices in multiples of eight, up to a maximum of 248 devices.

Block Multiplexer Channel: Each provides eight control unit positions. The block multiplexer channels permit simultaneous operation of high-speed devices. The ability to Block Multiplex and the facility for multiple requesting allow several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels that cannot utilize block multiplexing will function as if attached to selector channels. See Table 3 and IBM 4361 Channel Characteristics (GA33-1567), for details or use HONE aid ANCHLOAD.

Channel Address and Subchannels: Channel addresses may be selected at installation time from the range of one to six. Subchannels can be configured at installation time with up to 256 non-shared or shared subchannels, the latter each with devices in multiples of eight, up to a total of 256 devices.

DASD/8809 Adapter: DASD/8809 Adapters provide attachment of 3340/3344 (on model groups 4 and 5 only), 3310 and 3370 Direct Access Storage Devices or 8809 Magnetic Tape Units without the necessity of a control unit. Attachment of DASD and of 8809 units on one adapter is mutually exclusive. The configuration is selected at system installation time.

DASD attachment: Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string. The channel address may be from one to six. Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. 3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	01	02	03	04	05	06	07
	2A	2B	2C	2D	2E	2F	

		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F

and

X10	11	12	13	14	15	16	17
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

String Switch Capability: Allows sharing of 3340-A2 and/or 3370-A1/A2 and associated drives with another IBM processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340-A2 or 3370-A1/A2 must have the String Switch (#8150) installed. String switch support of 3340/3344 is limited to the static assignment of a shared string to one processor at a time.

S/3 Data Import: With the VSE/3340 Data Import utility program product (5746-AM3), 3348 Data modules that have been written on a S/3-3340 can be read on any directly attached 3340 drive.

Direct Access Storage Compatibility: (Standard on model groups 4 and 5 when a DASD/8809 adapter is installed, not available on model group 3). Designed primarily as a conversion aid, this feature provides emulation of 231X data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100Mb volume) or 3340 (70Mb volume) formats on 3370 Direct Access Storage. This allows programs written for use with 231X, 3330 or 3340/3344 DASD to be executed with only Job Control modifications. DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. Any one compatibility type can be activated at IPL time. Operates under DOS/VSE, OS/VS1 or VM/370, is not supported by MVS.

Data sets in fixed-block format and in emulated format can reside on the same 3310/3370 volume. A variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device, in case of 3370 models A2/B2 up to the capacity of 3370 models A1/B1. Residual space can be used in fixed-block format. However, access to one format only can be selected at IPL time. Each full or partial emulated volume begins on a predefined full-volume boundary. With OS/VS1 or VM/370 partial emulated volumes are not supported. For mapping of emulated volumes onto 3310/3370 volumes and for device address assignment refer to "IBM 4361 Direct Access Storage Compatibility" (GA33-1569).

Performance: Use of DAS Compatibility or 3340 direct attachment introduces additional channel demands and can have an effect on system performance, particularly in environments with high I/O load on emulated DASD. Batch job execution elapsed times may increase. Exclusive use of DASD emulation is not recommended in any SCP environment. Limitations: (1) Not supported on model group 3. (2) Operates on up to two consecutively addressed strings of 3310 or 3370 attached to the DASD adapter. (3) Direct attachment of 3340/3344 is limited to two strings on the system. (4) One type of emulation can be activated at IPL time. (5) 3330-11 cannot be emulated. (6) Emulation cannot be used on 3370 drives which are shared via string switch. (7) VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370. (8) OS/VS1 does not support 2311, native or emulated. (9) MVS does not support DAS compatibility. Program Order: The required utility programs for initialization and surface analysis of the 3310/3370 DASD as well as the formatting of the emulator extent are included in the VSE SCP, 5745-030 or VSE/AF or combined with VSE/SIPO/E products. OS/VS1 (5741-VS1), VM/370 (5749-010) and VM/SP contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device

Support Facilities can also be ordered separately with program order number 5747-DS1.

8809 Magnetic Tape Unit attachment: 8809-1A and up to five additional 8809 tape units (consisting of a mix of 8809-2s and 3s) may be attached. Allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for dedicated loading or off-loading DASD devices. Because streaming mode may not be sustained, the 3340/3344 should not be used with the 8809 in that mode. Can operate in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read-Backward commands are not supported, the Read-Backward operation is simulated in the Logical IOCS (MTMOD) of VSE. Channel and device addresses may be assigned at system installation time from the range of X00 to X05, where X is one to six.

Display/Printer Adapter: In addition to the console device up to 15 (seven when the Workstation Adapter is installed) of the devices attachable may be installed in any combination. All terminals attached to the Display Printer Adapter can be driven at distances up to 610m (2,000 ft.) using the IBM Cabling System or 1,500m (4,920 ft.) using coaxial cable. No more than two 3262 and/or 3289 printers and/or 4245-D12 or one 4245-D20 can be included. The 3262 or the 3289 may be used as system printers only, depending upon control program or program product support. One terminal printer may be used as a console hardcopy device. Other terminal printers may be used for local copy operation in shared mode only. Print files may be interrupted by local copy output. The remaining ports may be used for attachment of displays, printers and workstations for user-written applications. Display/Printer Adapter support includes all standard functions of the 3274-1B with the respective terminal devices attached. In addition, the following 3278/3279 special features are supported: Keyboard Numeric Lock, Audible Alarm (standard on the 3279), Security Keylock and Switched Control Unit. Other 3278/3279 special features are not supported. 3278 or 3279 Display Station keyboard feature codes #4621, #4622, #4623, #4627, #2715, #2716, #2717 and the model C1 and C2 keyboards of the 3178 and the 122 key (Japan only) > (or 124 key for Japanese Katakana) < keyboards of the 3179 Display Station and the 3180 Display Station models 11X, 12X, and 13X (except in APL mode) are supported. If two different keyboards are required for 3278/3279s, one must be #4621(Japan only) > or #2715 <).

Workstation Adapter: The Workstation Adapter (WSA) supports almost all features/ function of the Display/ Printer Adapter (DPA), except e.g.: 3205, 3262-1,11, 1052 mode, Data Entry/ Keypunch (#4623). Beyond the Display/ Printer Adapter capability following features/functions are supported: 3270 Extended Datastream for extended highlighting, seven colors and programmed symbols, screen sizes up to 3,564 characters, Distributed Function Terminal (DFT) mode and 3278/3279 APL keyboard. When the WSA is installed, the number of ports on the Display/Printer Adapter is reduced from 16 to 8. However, the additional number of ports available with the WSA installed is 32, requiring one 3299-1 Terminal Multiplexer for each group of eight ports. This provides a total of 40 ports on the DPA and WSA together. The functional level of the eight DPA ports remains unchanged. The 3179 and 3180 Display Station are supported in 3278/3279 emulation mode. The 4245-D12/D20 printers are supported on the WSA as terminal printers or as system printers. A maximum of three 4245-D12 or two 4245-D20 may be installed. If used as system printer, then specify feature #9160 is required on the 4245-D12/D20, and specify feature #9261 is required on the 4361 Processors shipped until March 1986.

3262-1/11 and 3289 printers are not supported on the WSA. The multiple logical terminal facility of the 3270 PC allows the user to designate up to four terminal addresses in a single 3270 PC. This requires one physical and up to four logical addresses for one physical port on the WSA. When planning installation of the 3270 PC, considerations must be given to the number of logical and physical addresses that are to be used compared to the maximum number of addresses (63) and ports (32) that are available on the WSA.

Serial non-IBM interface (SOEMI): This interface can be used to attach a variety of non-IBM subsystems and devices to the DPA/WSA. A protocol based on structured fields is implemented in microcode

and can be used by standard S/370 I/O instructions, providing the user full programming flexibility. OEM adapters are required to attach the subsystems and devices to the SOEMI in order to provide the appropriate conversions and control functions. Examples are the attachment of subsystems based on board-level microcomputer devices using non-IBM standards, e.g., IEEE-796. The DPA supports up to two SOEMI adapters with an aggregate data rate of up to 17K bytes per second (inbound) or 30K bytes per second (outbound). The WSA supports up to four SOEMI adapters with an aggregate data rate of up to 22K bytes per second (inbound) or 45K bytes per second (outbound). These are the maximum rates that may be impacted by other processes in the 4361 Processor, in particular on the DPA/WSA. Prerequisites: 4361 EC-Level 364435. Limitations: On the DPA SOEMI support is exclusive with 3279 terminal support for Katakana, Canadian-French, and 1052 operator console emulation support.

DISPLAY/PRINTER AND WORKSTATION ADAPTERS-ADDITIONAL INFORMATION

Channel 0 addresses for these devices are assigned at installation time. The 3179 and the 3180 displays are supported in 3278/3279 emulation mode. The 3268 and the 5210 printer are supported as 3287.

Cable Order: See machine pages of the device to be attached for ordering information for the required cable.

Keyboard/Character Set Language: The keyboard/character set language for devices attached to the Display/Printer Adapter or to the Workstation Adapter is selected at installation time of the machine or the device via a manual operation. It must correspond to the keyboard/character set language ordered for the device. A commonly used language/keyboard combination is pre-selected when the machine is shipped. On the DPA, one or two language/keyboard combinations are supported as follows:

a) One language chosen from Table 1 is used on the 3205-1, the 3278-2A or the 3279-2C operator console and can also be used on displays with typewriter keyboards and on terminal printers.

b) In addition to selection (a), displays with one Data Entry Keyboard type, using the same or optionally a second language from table 1, 3278/3279 keyboard feature Data Entry (#4622), #2716 or Data Entry, Keypunch-Layout (#4623) are supported. The 3178 model C1 and the 3180 model 12X are compatible with 3278 with #4622.

Notes:

Support for Data Entry/Keypunch-Layout Keyboard (#4623) should not be ordered because of diminishing usage. Do not plan its use in future applications. It is not supported on the Workstation Adapter.

Data Entry Keyboard cannot be specified for display workstations if Katakana is to be used on both the operator console and the workstations.

(c) Alternatively to selection (b) in addition to selection (a), displays with typewriter keyboard using a second language from Table 1. 3278/3279 keyboard features #4621, #4627, #2715 or #2717 are supported. The 3178 model C2 and the 3180 model 11X are compatible with 3278 with #4627.

On the Workstation Adapter, one keyboard language can be selected. In conjunction with the language, one of the following Typewriter keyboard layouts is selectable:

- Typewriter layout (standard, with or without APL)
- Typewriter layout 3178-C30
- Typewriter layout 3178-C40
- Typewriter layout 3178-C80

Additionally as standard function Data Entry keyboard layout is available.

Table 1 - Keyboard Language/Character Set Language

ASCII (3)	English US
Brazil (2, 3)	International (2,3)
Canadian Bilingual (WSA only)	Japanese English (2,3)
Canadian French (1)	Japanese Katakana (4)
Cyrillic (3)	Spanish Speaking
(3278/3279 mode only)	
EBCDIC (2, 3)	

Notes:

- Not supported for 3278-2A and 3279-2C operator consoles.
- Not available on 3180.
- Not supported by 3205-1 operator console.
- (Japan only) For Katakana on the operator console order, Keyboard #2720, character set #2773, and keyboard language #2973 on the 3278-2A or on the 3279-2C. If the 3278-2 or 3279-2A Display Stations installed on the Display/Printer Adapter are also to be installed with Katakana, they must have typewriter keyboard #2715 or #2717; a 3180 model 1 must have #4600 with Katakana.<)

Diskette Drive: Diskette data capacity is 242,944 bytes organized in 1,898 sectors of 128 bytes each (Diskette Type 1). When used with VSE refer to VSE/POWER documentation. Recorded Data can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5280, 8100, S/1, S/3, S/32, S/34, and S/38. The diskette drive is temporarily used as input device for Initial Microcode Load (IML) and when the Problem Finder Facility is used. Limitations: Support by VM/370 via IUP only. Device address on channel 0 is selected at installation time.

Minimum Configuration: The minimum system configuration consists of:

- A 4361 processor.
- One operator console. The operator console must be positioned for maintenance so that screen displays are legible for a CE working on the processor. If the operator console cannot

be positioned at the processor during maintenance, an additional operator console is required. If the operator console is a 3278 model 2A or a 3279 model 2C, a chargeable RPQ (for the cable extension) is required to allow remote installation.

- One High-Speed BMPX Channel (#1431) or one DASD/8809 Adapter (#3201)
- One system printer.
- The following additional requirement applies only to those systems where OLTs (Online Tests) are needed for I/O maintenance: Access to one Tape/DASD combination from Table A or Table B or any other means to generate the OLTs. (The Tape/DASD configurations are required for the generation and maintenance of the OLTs.)

Table A - Systems With Removable Disk Packs or No DASD

Combination	a)	or b)	or c)
DASD plus	2	1	0
Tape Units	0	2	3

Table B - Systems With Only Non-Removable Disk Packs

The amount of tapes required to generate OLTs depends on the operating system type and release level:

DOS/VSE AF Release 1.3.5, SSX/VSE Release 1.3.0 (or Higher Releases)	Any other operating system
---	----------------------------------

Tape	1	3
------	---	---

Maximum Configuration: The maximum number of channels and integrated adapters which can be installed are shown below with associated feature numbers. Your configuration should correspond to one column or be a subset of it. Either High-Speed BMPX Channel (#1431) or DASD/8809 Adapter (#3201) must be installed.

Table 2 - Maximum Configurations

TABLE 2 -- MAXIMUM CONFIGURATIONS

CHANNEL/ADAPTER CONFIGURATION OPTION	MDL GRP 3				
	C1D1	D			
Byte MPX Channel	5248	5248

 - * In Model Grp 3 for DASD only
 - Not available
 - C Channel configuration
 - D DASD/8809 adapter configuration
- Example C1D2 = one channel, two DASD adapters

Channel/Adapter Load Evaluation: All data passing through the system for any I/O device interferes with the data flow for other devices, producing I/O limitations. The limitations take two forms:

- Hardware exclusivities listed in the feature descriptions.
- I/O attachments that individually or in combination can produce frequent data overruns. Considerations in this category are:

The number of and the aggregate data rate of the Block Multiplexer Channels and the DASD/8809 Adapters.

The number and speed of lines attached to the Communications Adapter.

The number and class of over-runable devices on the Byte Multiplexer Channel.

Refer to Tables 3, 4 and 5 below to properly configure a 4361. If your configuration is within the limits of the examples shown no further validation is required. For model upgrades valid configurations of the 4331-2 or 4361-3 including channels, adapters and communications lines, are valid for a 4361-4 or 5. If additional channels/adapters/lines are to be installed, the limitations below should be observed.

Table 3 - Allowable Data Rates

ALLOWABLE DATA RATES									
Maximum Data Rate (Mbyte/sec)									
Configuration	Model	Block Mpx 1 2	High-Speed Bmpx 1 2 3	DASD/8809 Adapter					
	Grp	(Note 4)		1	2	3	4		
D1	3,4,5	1.25 1.25	- - -	1.86	-	-	-		
D2	3,4,5	1.25 1.25	- - -	1.86	1.86	-	-		
D3	4,5	0.50 1.25	- - -	1.86	1.86	1.86	-		
D4	4,5	0.50 0.50	- - -	1.86	1.86	1.86	1.86		
C1D2a	4,5	Class 3 1.25	3.00 - -	1.86	1.86	-	-		
C1D2b	4,5	0.50 1.25	1.86 - -	1.86	1.86	-	-		
C1D1	3	1.25 -	1.86 - -	1.86	-	-	-		
C2D1a	4,5	Class 3 1.25	3.00 3.00 -	1.86	-	-	-		
C2D1b	4,5	0.50 1.25	1.86 3.00 -	1.86	-	-	-		
C1	3	1.25 -	1.86 - -	-	-	-	-		
C2	4,5	1.25 1.25	3.00 3.00 -	-	-	-	-		
C3a	4,5	Class 3 1.25	3.00 3.00 1.50	-	-	-	-		
C3b	4,5	0.50 1.25	1.86 3.00 1.86	-	-	-	-		

Notes:

- See Table 4 below for number and speed of lines concurrently operable on the communications adapter together with unbuffered devices (example 2501) attached to the Byte Multiplexer Channel.
- If multiple Class 1 devices are to be operated concurrently on the Byte Multiplexer Channel, consult IBM 4361 Channel Characteristics (GA33-1567), or use HONE aid ANCHLOAD.
- For data rates and recommended attachment of commonly used devices refer to Table 5 below.
- Second BMPX channel is not available on model group 3.

- For IBM 3480 Magnetic Tape Unit data rates, refer to Table 5, note 1.

Table 4 - Allowable Number Of Communication Lines

With Line Speed Up To 9600 bps

Configuration	Single Device on Byte Mpx Channel			
	None	2501	1442	1419
D1	8	8	8	8
D2, D3, C1D1	8	8	8	7
D4, C1D2	8	8	8	6

C2, C2D1	8	8	6	3
C3	8	5	4	1

PROGRAMMING SUPPORT

Note: Lines of different speed may be mixed. Maximum number of lines is eight. Aggregate data rate of 64K bps may not be exceeded. Each X.25 line, because of full-duplex operation, contributes twice the single line speed to the aggregate data rate. For configurations with line speed higher than 9600 bps refer to IBM 4361 Channel Characteristics (GA33-1567), or use HONE aid ANCHLOAD. Line configurations which exceed the load maximum may be installed, however, they should only be operated concurrently within an allowable configuration.

Table 5 - Data Rates and Recommended Attachment

of Selected I/O Devices			
Device	Data Rate (Mb/sec.ec)	Recommended Attachment in Sequence of Preference	
3310	1.030	da	
3370	1.860	da	hb
3375	1.860	hb	
3380	3.000	hb12	
3330	0.805	hb	
3340/3344	0.885	hb	da
3350	1.200	hb	
3411	0.080	b2	Bu
3420-7	0.320	b2	b Bu
3420-4	0.470	b2	b
3420-8	1.250	b2	b
3430	0.312	b2	b Bu
3480	note 1	hb12	hb b
3272/3274	Class 3	b1	b Bu
3203-5,2821	Class 3	b1	b Bu
3262-5	Class 3	b1	b Bu
4245-12/20	Class 3	b1	b Bu
3705 NCP	Class 3	b1	b Bu
3705 EP,2701	Class 2	By	
2501,1442	Class 1	By	b2(s)
1419	Class 1	By	
3720 NCP	Class 3	b1	b Bu
3725 NCP	Class 3	b1	b Bu
3720 EP	Class 2	By	
3725 EP	Class 2	By	

Legend:

- Class 1 - unbuffered device, manual recovery from overrun
- Class 2 - unbuffered device, programmed recovery
- Class 3 - buffered device, operates at channel speed
- da - attach to a DASD/8809 adapter
- b - attach to any Block MPX channel
- b1 - attach to Block MPX channel 1
- b2(s) - attach to BMPX channel 2 as single device
- hb - attach to any High-Speed BMPX channel
- hb12 - attach to HS-BMPX channel 1 or 2
- Bu - attach to Byte MPX channel in burst mode, may not operate concurrent with Class 1 or Class 2 devices
- By - attach to Byte MPX channel in byte mode

Note 1: The 3480 Magnetic Tape Unit data rates: In DC Interlock mode: Operates with channel speed (up to 1.25Mb/sec.) on any Block MPX or High-Speed Block MPX. In Streaming mode: On model group 3 can operate on High-Speed Block MPX #1 at 2.0Mb/sec.. On model group 4 and 5 can operate on High-Speed Block MPX #1 and #2 at 3.0Mb/sec. or 2.0Mb/sec., on #3 at 2.0Mb/sec.. If High-Speed Block MPX #1 operates I/O with more than 2.0Mb/sec., then on High-Speed Block MPX #3, the 3480 can only operate in DC Interlock mode at channel speed (refer to "IBM 4361 Channel Characteristics", GA33-1567).

The 4361 Processors implement new machine and channel checking techniques which significantly increase recovery capabilities, reduce downtime and allow increased deferred maintenance. The 4361 model group 5 supports the Start I/O Fast Release instruction with queuing of I/O requests. This can improve performance by up to 20 percent in commercial workloads with high input/output activity. 4361 Processors are supported by the following IBM programming releases (and later releases, unless otherwise indicated):

Model Groups 3, 4, and 5 Support (2Mb to 12Mb):

- VSE/System Package 2.1.0 with the appropriate SPEs installed, or VSE/Advanced Functions 2.1.0 with the appropriate SPEs installed, in all modes (ECPS/VSE or S/370 modes, and as a guest under VM).
- VSE/System Package 1.1.0 (VSE/SIPO/E 1.4.0), or VSE Advanced Functions 1.3.5, with the appropriate SPE installed, in all modes. Load leveling for the model group 3 is done as for a model group 4 or 5.
- SSX/VSE 1.4.0, in ECPS/VSE mode, and as a guest under VM.
- SSX/VSE 1.3.0, with the appropriate SPEs installed in ECPS/VSE mode, and as a guest under VM. Load leveling for the model group 3 is done as for a model group 4 or 5.
- VM/System Product Release 3 with SPEs installed, or VM/System Product Release 4.
- Model Groups 4 and 5 (16Mb) Support: Supported by current release of VM/SP, VSE/SP in 4361 ECPS: VSE mode and, on model group 5, MVS/SP. For VSE/SP when running the 4361 in S/370 mode, Version 2.1.1 or later releases are required.

Model Group 5 Additional Support:

- MVS Release 3.8 with MVS/SP-JES2 1.3.0 (5740-XXS) and MVS/SP-JES3 1.3.0 (5740-XXN). ECPS/MVS must be activated. Operation as a guest under VM is supported and assisted. MVS does not support the integrated communication adapter or the DASD/8809 adapter.

OS/VS1 Release 7 with OS/VS1/Basic Programming Extensions Release 4 supports the 4361 Processors. The Start I/O Fast Release instruction and the enhanced recovery capabilities of the 4361 are not supported in OS/VS1. At start-up of the system (at IPL time), the 4361 Processors can be conditioned to be viewed by the operating system as a 4331-2. Previous releases of VSE, SSX/VSE, and VM, as well as OS/VS1, which do not recognize the 4361 Processors, can then be used. This additional programming support will ease migration to the 4361 Processors for customers coming from a 4331 with one of the following release installed:

- VSE/SIPO/E 1.2.1 or 1.3.1, and releases with VSE/Advanced Functions 1.2.0 or 1.3.0 as a base, in ECPS/VSE or S/370 mode, including as a guest under VM.
- VSE/Advanced Functions 1.2.0 or 1.3.0, in ECPS/VSE or S/370 mode.
- SSX/VSE Release 1.2.0 or 1.3.0 in ECPS/VSE mode, including as a guest under VM.
- VM/System Product Release 2 or Release 3 without the SPE supporting the 4361.
- OS/VS1 Release 7, with or without OS/VS1/Basic Programming Extensions, including as a guest SCP under VM.

Customers who install the 4361 processor with a VSE, SSX/VSE, or VM release supporting the 4361 as a 4331 should plan to subsequently migrate to the latest release in order to gain the benefits of enhanced recovery. Customers who install with OS/VS1 Release 7 can achieve better utilization of a 4361 model group 5 by migrating to MVS/SP.

Additional Comments:

MACHINES

- VSE releases prior to VSE/AF 2.1.0 and VSE/SP 2.1.0 in S/370 mode will not operate on the 12Mb models unless VSE is a guest under VM. When the VM linkage enhancements are generated in the VSE system, it can then fully utilize a 12Mb configuration.
- Under VSE, basic support for attachment of X.21 switched lines to the Communications Adapter will be available in ACF/VTAM 2.1.
- OS/VS1 will operate on the 12Mb models, but the SCP will only access up to 8Mb. When OS/VS1 is a guest SCP under VM, and the VM handshaking feature is generated, an OS/VS1 system can fully utilize the 12Mb storage.
- Support for the 4361 in VM/SP Release 3 can be installed with an SPE.
- Support for the 4361 model group 5 in MVS/SP 1.3.0 and later can be installed with PTF UZ90274 via SMP.

ECPS/VM/370: The 4361 Processor provides ECPS/VM/370 support at Level 20, compatible with VM/SP Release 2. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation, and Virtual Interval Timer. Whenever ECPS/VM/370 and ECPS/VSE are both selected at IPL time, ECPS/VM/370 is enhanced to include the functions of the Shadow-Table Bypass Assist defined in Virtual Machine Assist and Shadow-Table-Bypass Assist (GA22-7074). These functions enhance the performance of MVS running under VM/370 in a V=R environment with VM/System Product.

ECPS/MVS: The 4361 Processor model group 5 provides the privileged instructions required by MVS/System Product - JES2 (5740-XY5) and MVS/System Product - JES3 (5740-XYN). These instructions involve the following MVS functional areas:

- SVC Interrupt Handling
- Integrity
- Tracing
- Lock Management
- Real Storage Management

SPECIFY

Note: Specifications and no-charge options are for plant installation only, unless otherwise indicated.

- Power:

AC, 1-phase, 3-wire, 60 Hz:
200V #2732 208V #9902
220V #2803 240V #9914

- AC, 1-phase, 3-wire, 50 Hz: Meets Japanese current-leakage requirements.

200V #2806 220V #2813
230V #2821 240V #2801

- Color: #9065 for pebble gray, #9061 for garnet rose, #9063 for classic blue, #9060 for willow green, #9064 for charcoal brown, #9062 for sunrise yellow.

- Operator Console: #9325 for 3205-1 operator console; #9327 for 3278-2A or 3279-2C operator console.

- Machine Nomenclature:

Japanese #2930
Portuguese (Brazil) #2933
Spanish Speaking #2931

- (Canada only>In Quebec: Specify #2935 for Canadian French, #2934 for English.<)

Note: Specification of nomenclature is optional. The default language is determined by the country code. Default language for countries not shown above is English.

- Specify Feature #9261 is a composite of various new enhancements to the Display Printer Adapter and Workstation Adapter. It is required on 4361 Processors shipped until March, 1986. Subsequent to March, 1986, the function of #9261 will be standard.

- 4234 model 1 Printer Attachment: Specify #9261 on the 4361.

- Remote Support Facility (RSF) and Remote Operator Console Facility (ROCF): Consist of functions provided by the Service Processor and includes a communications interface. They are recommended to be ordered for initial shipment but can also be installed in the field.

The Remote Support Facility is a customer engineering tool. Its use is recommended. RSF permits the customer engineer, after customer authorization, to manually establish a connection to a RETAIN terminal at a remote IBM support location, and from there monitor and/or perform problem diagnosis on the 4361.

The Remote Operator Console Facility is an extension of RSF. It enables an operator at a host location to IML/IPL and execute other manual control functions for a remote 4361 via a 3275 display station, or via a 3275 emulated on a host attached 3270 or emulated on an IBM Personal Computer (for details see note below). After IML and IPL is complete the remote operator console can be disconnected and the remote 4361 can be operated in stand-alone mode, or control can be turned over to existing networking facilities.

Prerequisites: For use of RSF and/or ROCF. RSF/ROCF are ordered via a no-charge specification. The customer must provide the telephone line and arrange for the connection of the telephone interface cable provided by IBM to the telephone network. When an external modem is required it must be provided by the customer. For use with ROCF it must include auto-answer. RSF operates in manual answer mode. For details on ordering and customer responsibilities, see Systems and Procedure Manual.

Note: On the 3275 (for 1200 bps only), Integrated Modem #5501 and Dial #3440 must be installed. The 3275 Display Terminal can only be obtained on an "as available" basis. The following alternatives are available:

IBM PC with 128Kb memory, 160Kb diskette drive, BSC communication adapter, adapter cable and the BSC 3270 emulation licensed program (external modem is required). For transmission speed see specify codes for the 4361.

3275 Emulation via microcode on a 4361 (using the operator console) or, using a 3270 terminal for remote control (which is part of the host operating system; MVS/OCCF 5665-288 or VM pass through facility 5748-RC1).

Specify one to provide RSF and/or ROCF:

(Canada only> Specify #9514 as the preferred RSF/ROCF feature. It avoids the need for external modems or external protective couplers and can be used for both RSF and ROCF. It provides integrated modem, 1200 bps, switched network, manual or auto-answer. A telephone set with exclusion key and a RJ41S or RJ45S type data jack is required. A FCC registered protective coupler is included. Ringer Equivalence Number (REN) is 0.8B.

Specify #9517 for ROCF connection for 4800 bps attachment to external modem for switched networks with clocking and auto-answer via EIA RS-232-C interface.

Keep specify #9511 (for use with RSF and/or ROCF) on an installed 4331 to be upgraded to a 4361 for EIA RS-232-C interface, 1200 bps, switched network. An FCC registered external modem, compatible with the WE202S modem or equivalent, is required. For ROCF the modem must include auto-answer.

Keep specify #9510 (for use with RSF only) on an installed 4331 to be upgraded to a 4361 which provides integrated

modem, 1200 bps, switched network, manual answer. A telephone with FCC registered Data Access Arrangement (DAA) compatible with CDT Coupler Series 1000A interface and operation, with a 4-prong jack, is required. <)

(Except Canada, Japan and Hong Kong) Specify #2836 for RSF/ROCF connection via integrated modem, 1200 bps, switched network, manual or auto-answer.

Specify #2838 for RSF/ROCF connection via CCITT V.23/V.24/V.28 interface. For use with ROCF the customer-supplied or PTT mandatory non-clocked external modem must include auto answer. For RSF an acoustic coupler can be used on this interface.

Specify #9517 for ROCF connection for 4800 bps attachment to external modem for switched networks with clocking and auto-answer via EIA RS-232-C interface. <)

(Hong Kong Only) Specify #2838 and #2839 for RSF/ROCF connection via CCITT V.23/V.24/V.28 interface. For use with ROCF the customer-supplied PTT mandatory non-clocked external modem must include auto answer. Specify #2839 with #9517. <)

(Japan only) Specify #2944 and #2943 for use with RSF only via 1200 bps Integrated Modem, nonswitched, together with the NTTCA-2 modem service cable connector. Note: Katakana is not supported for 3275-2 as a remote console. It is supported when the 3275 is emulated in the host system by the VM/Pass-Thru Facility program product. <)

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Floating-Point Multiply Accelerator (#1100): Optional on model group 3, standard on model groups 4 and 5. Executes frequently used floating-point multiply instructions in VLSI gate array hardware rather than in microcode, resulting in an improvement of execution speed for these instructions by a factor of 3 to 8. When this feature is installed in the model group 3 (factory installation only), mathematical functions supported in the Elementary Math Library (EML PRPQ P81005, 5799-BTB) are assisted by microcode to improve performance. The EML PRPQ provides subroutines that can be called from VS FORTRAN in the VM/SP environment. The following functions are microcode assisted: square root, logarithm (ln, log), exponentiation, sine, cosine, arctangent, power. Maximum: One. Field installation: No.

Auto Start (#1200): With this feature the processor can be powered-on by telephone call via the Remote Operator Control Facility (ROCF) (here an external modem with autoanswer is required), or automatically at a predetermined time and day of the week. A "Manual Operation" menu is provided at the operator console to preset the time and day of the week. Each day of the week may be associated with a different power-on time. The processor powers-on and proceeds with initial microprogram load, sets the TOD clock from a battery-operated clock, and then IPLs the system. This automated system bring-up is supported by VSE/SP 2.1, SSX/VSE 1.4.0, and VM/SP 1.4. The bring-up sequence is also followed after an AC power outage upon return of power with the option to suppress IPL to prevent uncontrolled restarts. IPL after an uncontrolled shut-down may need operator intervention. An additional clock is implemented in the processor to sustain time and date during power-off periods. During normal power-off this clock is powered by an additional stand-by power supply. In case of a power outage or if the processor is disconnected from the power net, a battery with a life time of approximately four years supplies the clock. The battery can be changed while the system has power-on or -off without losing the time and date or without interfering with the system. This feature will be available for 4361 shipments beginning in April 1985. Maximum: One. Prerequisite: An external modem with autoanswer is required for the function "Auto Start by telephone call via ROCF". Field Installation: Yes. For field installation an MES will be available by October 1985. Field installation on 4361s shipped prior to April 1985 or 4361s upgraded from 4331s, require RPQ 7B0987 as prerequisite.

Block Multiplexer Channel (#1421): Optional on model group 3, one standard on model group 4, two standard on model group 5. Provides attachment of high-speed I/O devices, except DASD. Data transfer rate is up to 1.25M bytes/second. Limitations: For data rate and attachment limitations for devices and communications lines refer to Maximum Configuration section above or to IBM 4361 Processor Channel Characteristics (GA33-1567), or use HONE aid ANCHLOAD. Maximum: One, optional for model group 3. Field Installation: Yes.

High-Speed Block Multiplexer Channel 1, 2 and 3 (#1431, #1432, #1433): (HS-BMPX 2 and 3 are not available on model group 3). Provides attachment of high-speed I/O devices including 3330/3333, 3340/3344, 3350, 3370, 3375, 3380 (3380 not on model group 3) via control units including 3830 model 2 and 3880. The ability to Block Multiplex and the facility for Multiple Requesting allow several I/O units to operate concurrently with greater channel efficiency. Can operate in Data Streaming Mode. Devices attached which cannot utilize block multiplexing will function as if attached to a selector channel. Up to eight control units may attach. Data transfer rate is up to 3M bytes per second on model groups 4 and 5 and up to 1.86M bytes per second on model group 3. Channel address and sub-channels: Same as on the block multiplexer channels. Limitations: (1) HS-BMPX 2 and 3 are not available on model group 3. (2) HS-BMPX is mutually exclusive with certain DASD/8809 Adapters: on model group 3, Adapter 2 (#3202) is mutually exclusive with HS-BMPX 1 (#1431); on model groups 4 and 5, Adapter 1 (#3201) is mutually exclusive with HS-BMPX 3 (#1433), Adapter 2 (#3202) is mutually exclusive with HS-BMPX 2 and 3 (#1432, #1433), Adapters 3 and 4 (#3203, #3204) are exclusive with any HS-BMPX (#1431, #1432, #1433). (3) For data rate and attachment limitations for other devices and communications lines refer to "Maximum Configuration" section above or to "IBM 4361 Processor Channel Characteristics" (GA33-1567), or use HONE aid ANCHLOAD. (4) 231X devices must be attached to a High-Speed Block Multiplexer Channel and cannot be used on a Block Multiplexer Channel. Maximum: One each. Field Installation: Yes. Prerequisites: #1431 for #1432; #1431 and #1432 for #1433.

WSA Control Storage Expansion (#1801): The control storage of the Workstation Adapter can be expanded by 64Kb to accommodate new functions. Limitations: None. Maximum: One. Field Installation: Yes. Prerequisite: Feature #2002.

Workstation Adapter (#2002): The Workstation Adapter (WSA) extends the total number of ports available on the DPA and the WSA to 40. The WSA supports the following features/functions beyond the Display/Printer Adapter capability: 3270 Extended Datastream for extended highlighting, seven colors, programmed symbols, screen sizes up to 3,564 characters, Distributed Function Terminal (DFT) mode and a 3278/3279 APL keyboard. Limitations: When the WSA is installed, the number of ports on the Display/Printer Adapter is reduced from 16 to 8. The functional level of the eight DPA ports remains unchanged. A maximum of three 4245-D12s or two 4245-D20s may be installed. The 3179 and 3180 Display Stations are supported in 3278/3279 Emulation mode. Maximum: One. Field Installation: Yes. Prerequisites: Each group of eight ports requires one 3299-1 Terminal Multiplexer. If a 4245 is used as system printer, then specify feature #9160 is required on the 4245-D12/D20, and specify feature #9261 is required on 4361 processors shipped until March 1986. Restrictions: Mutually exclusive with Loop Adapter RPQs 7B0795, 7B0796, 7B0797.

DASD/8809 Adapter 1, 2, 3 and 4 (#3201, #3202, #3203, #3204): (Adapters 3 and 4 are not available on model group 3). Allows attachment of the 3310, 3370 and 3340/3344 DASD or 8809 Magnetic Tape Units to the 4361 Processor. Limitations: On model group 3: 3340/3344 do not attach, 8809 attaches to Adapter 2 only.

DASD Attachment: Up to four strings of devices may be attached to each adapter. A string consists of one A-unit and up to three B-units. The attachable device types may be intermixed on each adapter but not within a string. Device strings may be configured on each adapter as follows:

- Up to four strings of 3310-A1s or A2s with 3310-B units attached, up to a maximum of four drives per string.

- Up to four strings of 3370-A1/A2s with 3370-B1/B2 units attached, up to a maximum of four drives (eight actuators/addresses) per string.
- Model groups 4 and 5 only: up to two strings of 3340-A2s with 3340/3344-B units attached, up to a maximum of eight drives per string can be attached to one or two DASD/8809 Adapters.

8809 Magnetic Tape Unit Attachment: Provides for attachment of the 8809 Magnetic Tape Unit. One 8809-1A may attach. Up to five 8809-2s and 3s may attach to the model 1A for a total of six 8809 Magnetic Tape Unit drives. The 8809 is not supported by VS1 and MVS.

Limitations: (1) Adapters 3 and 4 (#3203, #3204) are not available on model group 3 and 4. (2) DASD and 8809 are mutually exclusive on the same adapter. (3) DASD/8809 Adapters are mutually exclusive with certain High-Speed Block Multiplexer Channels. Model group 3: Adapter 2 (#3202) is mutually exclusive with HS-BMPX 1 (#1431). On model groups 4 and 5, Adapter 1 (#3201) is mutually exclusive with HS-BMPX 3 (#1433), Adapter 2 (#3202) is mutually exclusive with HS-BMPX 2 and 3 (#1432, #1433), Adapters 3 and 4 (#3203, #3204) are exclusive with any HS-BMPX (#1431, #1432, #1433). (4) On model group 3 only, Adapter 1 is limited to attachment of DASD only. (5) On model group 3 only, 3340/3344 attachment is not supported. (6) 3310 and 3370 are not supported by VS1 or by MVS in fixed block mode. MVS does not support directly attached 3340/3344. (7) For data rate and attachment limitations for other devices and communications lines refer to "Maximum Configuration" above or to IBM 4361 Processor Channel Characteristics (GA33-1567). (8) Use of direct-attached 3340/3344 introduces additional channel demands, and can have an effect on system performance, particularly in batch environment with heavy I/O load. Performance considerations should be carefully reviewed before proposing use of the 3340/3344. Maximum: One #3201, #3202, #3203 and #3204. Field Installation: Yes. Prerequisites: #3204 requires #3203, #3203 requires #3202, #3202 requires #3201.

Byte Multiplexer Channel (#5248): Optional on model groups 3 and 4 (standard on model group 5). Limitations: For data rate and attachment limitations for other devices and communications lines refer to "Maximum Configuration" section above or to IBM 4361 Processor Channel Characteristics (GA33-1567), or use HONE aid ANCHLOAD. Maximum: One, optional for model groups 3 and 4. Field Installation: Yes.

COMMUNICATIONS FEATURES

Note: IBM Integrated Modems are not available on the 4361 Processor.

Communication Facilities, terminals, modems, other equipment supported: For supported terminals and communications facilities refer to the M2700 pages.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communication facilities and services.

Communications Adapter: Provides the basic control and common circuits for the direct attachment of up to eight communication lines in any combination, operating in the following transmission modes: synchronous (BSC), asynchronous (Start/Stop) Synchronous Data Link Control (SDLC), and HDLC (LAPB) for X.25 lines. Connection via 2-wire or 4-wire line is possible. Simultaneous bidirectional (full-duplex) data transmission over one line is not supported, except when operating in an X.25 network. Maximum aggregate data rate is 64,000 bps. The maximum speed of each of the eight lines is 19,200 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 64,000 bps. For number and speed of lines allowable refer to Table 4 above or see "IBM 4361 Channel Characteristics" (GA33-1567).

The Communications Adapter has the following structure: The Communications Adapter Base contains common circuits and control. Each of the telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment

feature. Another feature serves for autocall unit interface. The following optional line interface features are available:

- Up to eight line features without internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) with clocking and EIA RS-232-C/CCITT V.24/V.28 or X.21bis interface.
- Up to eight line features with internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) without clock and EIA RS-232-C/CCITT V.24/V.28 or X.21bis interface (maximum of seven lines for X.25).
- Autocall Unit interfaces (EIA RS-366/CCITT V.25) for up to two of the installed lines with EIA RS-232-C/CCITT V.24/V.28 interface.
- One synchronous high-speed line feature (V.35 interface).
- Up to eight line features without business machine clock for attachment to X.21 Nonswitched Data Networks, or to X.25 Networks (maximum of seven lines).
- Up to eight line features without business machine clock for attachment to X.21 Switched Data Networks.
- Up to eight line features for synchronous transmission via local attachment without modems.

Autocall Unit Interface (#1020): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS-366 or CCITT V.25 interface may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. Maximum: Two. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601 and #3701 (in switched operation) for each Autocall Unit Interface installed. #2835 is required in certain countries.

Communications Adapter Base (#1601): Allows attachment of up to eight lines plus Autocall Unit Interface (#1020) for up to two of the lines. Limitations: Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "Subchannels" above for details. Maximum: One. Field Installation: Yes. Specify: See Table 6 for required specify codes for each line feature attached.

Communication Line Isolation (#2835): Provides an isolation barrier between the modems or Automatic Calling Units and the Communications Adapter, as required by certain countries. Up to ten isolation barriers are available and may be used for one Remote Operator Console Facility, #2833, or #2838, #2839 (Hong Kong), for up to two Autocall Unit Interfaces (#1020), and for up to eight EIA/CCITT Interfaces (#3701). Maximum: One per line, ten on the system. Field Installation: Yes. Prerequisites: Each barrier must be associated with one #1020 or #3701 feature.

EIA/CCITT Interface (#3701): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line. When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC, a SDLC, or a X.25/HDLC line is supported with any line speed up to 19,200 bps. The maximum line speed on switched network backup or switched networks is dependent on country PTT services. When this feature is installed in conjunction with Line Attachment Base for Nonclocked Modems (#4696), then a BSC, a Start/Stop (including ASCII/TTC2 line protocol), or a SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. Maximum: Eight. Cable Order: Required, for attachment to external equipment. Field Installation: Yes. Prerequisites: #1601. One #4695 or #4696 is required for each feature #3701 installed. #2835 is required to permit attachment to PTT communications facilities in certain countries. Specify: See Table 6 for line position codes. On machines shipped prior to February 1986, the speed of the EIA/CCITT interface is 9600 bps. If 19200 bps is required on those machines, then RPQ 7B1100 must be ordered (for Clocked Modems only).

Line Attachment Base For Clocked Modems (#4695): This feature is a prerequisite for all line adapters that attach to modems (Data Circuit-Terminating Equipment) and which provide clocking and comply with CCITT V.24/V.28 V.35, X.21, X.21bis interface recommendations. See the various line features below to determine when it is required. Maximum: A maximum of eight Line Attachment Bases #4695 and/or #4696 can be installed. Field Installation: Yes. Prerequisites: #1601.

Line Attachment Base For Nonclocked Modems (#4696): This feature is a prerequisite for all line adapters that attach to modems (Data Circuit-Terminating Equipment) and which do not provide clocking and comply with CCITT V.24/V.28 recommendation. See the various features below to determine when it is required. The clock speed can be wired at installation to one of the following:

- Start/Stop (IBM Type I): 75, 110, 134.5, 300, 600, 1200 and 2400 bps.
- Start/Stop (ASCII/TTC2): 75, 110, 134.5, 300, 600, 1200 and 2400 bps.
- BSC: 600 or 1200 bps.
- SDLC: 600 or 1200 bps.

Maximum: A maximum of eight Line Attachment Bases #4695 and/or #4696 may be installed. Field Installation: Yes. Prerequisites: #1601.

High-Speed Modem Adapter (#4720): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 64,000 bps. Limitations: Is always installed in line position 1. No other line with speed higher than 19,200 bps can be installed. Maximum: One. Cable Order: Required for attachment to the external modem. Field Installation: Yes. Prerequisites: #1601 and #4695.

Local Attachment Interface (#4801): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the customer engineer at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a

maximum distance between Communications Adapter and terminal of:

- 800m at 1200 bps
- 400m at 2400 bps
- 200m at 4800 bps
- 100m at 9600 bps

For distances beyond 120m, to protect against damage by lightning, shielded cables should be used. For installation details see "IBM 4300 Installation Manual/Physical Planning" (GA24-3667), Appendix D. The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. Cable Order: Required for attachment of communications adapter and DTE to customer supplied terminal blocks. Maximum: Eight. Field Installation: Yes. Prerequisites: #1601 and 4695. Specify: See Table 6 for line position codes.

X.21 Adapter for Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 point-to-point or multipoint nonswitched communication line operating in SDLC transmission mode via a DCE complying with CCITT recommendation X.21 or X.25. In X.21 networks transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point and 2400, 4800 and 9600 for multipoint operations. In X.25 networks transmission may be at speeds of 2400, 4800, or 9600 bps. Limitations: If feature #5655 operates with a speed of 48,000 bps it must be installed in line position 1 (specify #9711). No other line with speed higher than 9600 bps can then be installed. Maximum: Eight. Field installation: Yes. Prerequisites: #1601 and #4695. For operation of X.25 lines ACF/VTAM is required. Specify: See Table 6 for line position codes. #9711 is required for operation at 56,000 bps. Cable Order: Required for attachment to external equipment.

X.21 Adapter for Switched Networks (#5656): Provides controls and circuits for attachment of one X.21 switched communication line operating in SDLC transmission mode via a DCE complying with CCITT recommendation X.21. For details of support see the M2700 pages (Chart 3 and Chart L). Transmission may be at speeds of 2400, 4800 or 9600 bps. Maximum: Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter, refer to Table 4 above. Field Installation: Yes. Prerequisites: #1601, one #4695 is required for each #5656 installed. Specify: See Table 6 for line position code.

Table 6 - Communications Adapter Configuration Feature And Position Codes

COMMUNICATIONS ADAPTER CONFIGURATION FEATURES AND POSITION CODES

Line Feature	Inter face	Att Base	1	2	3	Line Position 4	5	6	7	8
EIA/CCITT interface (for Clocked Modems)	#3701	#4695		#9532		#9534		#9536		#9538
			#9531		#9533		#9535		#9537	
EIA/CCITT interface (for Non-Clocked Modems)	#3701	#4696		#9522		#9524		#9526		#9528
			#9521		#9523		#9525		#9527	
Transmission Mode(1)										
Start/Stop(2) incl. ASCII/TTC2				#9682		#9684		#9686		#9688
			#9681		#9683		#9685		#9687	
High-Speed Modem Adapter	#4720	#4695		No position code required. Is always installed in line position one.						
X.21 Adapter for Nonswitched Networks	#5655	#4695		#9712		#9714		#9716		#9718
			#9711		#9713		#9715		#9717	

MACHINES

X.21 Adapter for Switched Networks	#5656 #4695 #9721	#9722 #9723	#9724 #9725	#9726 #9727	#9728
Local Attachm. Interface	#4801 #4695 #9451	#9452 #9453	#9454 #9455	#9456 #9457	#9458
Autocall Unit Interface (3)	#1020	No position code required. Association with the desired line via manual operation in the field.			

Note: The aggregate data rate of the Communications Adapter is 64,000 bps. Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each X.25 line, because of full-duplex operation, contributes twice the single line speed to the aggregated data rate.

1. BSC or SDLC transmission mode can be selected at installation time using the configuration tool.
 2. Start/Stop transmission mode requires EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696). IBM Start/Stop Line Control Type 1 or TWX/TTC Type 2 is selected at installation time using the configuration tool.
 3. Is linked to the desired EIA/CCITT Interface (#3701) and prerequisite (#4695 or #4696) by the customer engineer. Maximum of two #1020s may be installed.
- X.25 transmission mode is not possible on line position 4. Maximum number of lines is seven.

MODEL CONVERSIONS

Any downgrades of 4361 model groups are not available. Memory downgrades are not recommended for field installation. Customer price quotations and customer order acknowledgment letters for machine/model conversions must state: "Installation of this model upgrade involves the removal of parts which become the property of IBM." Depending on whether a feature on an installed 4331/4361 is standard, optional, or not available on the larger upgrade model of the 4361, different ordering actions will be required. Standard features of the 4361 model, which are optional but not installed on the machine to be upgraded, must be ordered via RPQ with the upgrade MES. The prices of these features are added to the model upgrade prices.

! * UPGRADES FROM 4321/4331 TO 4361 PROCESSORS ARE NO LONGER AVAILABLE.

	Feature 4331	Number On 4361 MG3	RPQ for adding to 4361 MG 4 or 5
Adapter Power Prerequisite	#1001	--	7B0758
Control Storage Expansion	#1901	--	7B0697 4331-1 only
Display/Printer Apt. Expansion	#2001	--	7B0813
Block Multiplexer Channel, 1st	#1421	#1421	7B0811
Block Multiplexer Chan., Add'l	#1422	--	7B0759
Diskette Drive	#3401	--	7B0760
External Signals	#3898	--	7B0761
Byte Multiplexer Channel	#5248	#5248	7B0810
Power Interface	#5531	--	7B0812
Power Interface, Add'l	#5532	--	7B0762 to MG5 only
Floating-Point Multiply Accel.	--	#1100	7B0887

Optional features of the 4361 which are not currently installed on the upgrading machine may be ordered with the upgrade MES without restriction. However, conversion time may be extended. Those 4331 feature codes and specify codes which are not available on the 4361 must be deleted with the MES upgrade order. Features installed which are not available on the 4361 will be removed. The customer has two options: (1) If the parts to be removed are returned to IBM with the gate exchange, the removal is free of charge. (2) If the customer elects to keep removed parts, an RPQ must be submitted listing each feature to be removed from the 4331. There will be a charge for these RPQs. The removal of features must be scheduled prior to the machine conversion.

Upgrades from 4331 to 4361-N05 (16Mb): No direct upgrade is available. Must be performed in two steps via two MESs, that will be installed in sequence:

1. Upgrade the 4331 to the 4361 model group 5 with identical memory size. If identical memory size is not available, then upgrade to the next higher size, e.g. 4331-J02 (1Mb) to 4361-K05 (2Mb).
2. Upgrade the memory to the 16Mb (4361-N05).

RPQs: The following 4331 RPQs are included in the 4361 as standard or as optional features:

RPQ #	Description	Feature #
-------	-------------	-----------

ML4707 Hi-Speed Digital Interface #4717
XD1603 STX Char in CRC of BSC lines Std
MM5017 Additional Subchannels Std
7S0276 Telegraph Term Ctrl 2 (TTY) Std
SU0190 MVS Assist (for 4361-5 only) Std
nnnnnn Various Special Language for DPA Std

Note: When a 4331 with RPQ 7S0276 installed is upgraded to a 4361, line position codes for the Start/Stop lines #968X must be included in the MES order (see Table 6).

1. The following RPQs for extended cable lengths are also available on the 4361: MM2195 (125 ft), XE0475 (50 ft), 7B0699 (75 ft), 7B0700 (100 ft).
2. The 4331 RPQs for connection of the Remote Support Facility (RSF) to the switched telephone network are also available on the 4361.
3. To install 4331 Loop Adapter features #4830, #4831, #4840 on a new 4361, prerequisite RPQs 7B0795, 7B0796, 7B0797 respectively, are required. To retain these features on a 4331 upgraded to a 4361, prerequisite RPQs XF3650, XF3963, XF3651 respectively, are required.
4. RPQ 7B1100 must be ordered if a higher speed EIA/CCITT interface feature is required for machines shipped prior to January 1986.

5. Loop Adapter RPOs 7B0795/6/7 are exclusive with 16 megabytes of main storage and with the workstation Adapter #2003.

Administrative Note: * UPGRADES FROM 4321/4331 TO 4361 PROCESSORS ARE NO LONGER AVAILABLE.

Model Upgrade Purchase Price: Assumes standard features of the model group 4 or 5 that are optional on the model group 3 as being installed on the latter. For upgrades from 4331 assumes standard features of the 4361 model group 5 that are optional on the 4331-1, -2 or -11 as being installed on the latter. For country prices consult your local financial organization.

Depending on whether an optional feature of a 4331/4361 is standard, optional or not available on the 4361 model to be upgraded to, the following actions are required:

4331 UPGRADING TO 4361

Legend:

- O Feature is optional
- N Feature is not available
- S Feature is standard
- R Feature available via RPQ
- No action

Notes:

- 1) Delete feature on the MES order (chargeable to standard).
- 2) Feature must be ordered via RPQ with the upgrade MES.
- 3) No action, feature is carried to new 4361 model.
- 4) Feature must be cancelled/removed.
- 5) Feature can be returned to IBM without charge or feature can be removed from the 4331 via removal RPQ (charge). In latter case removed parts are the customer's property.
- 6) For attachment of the 8809 order DASD/8809 Adapter (#3201, #3202, #3203, or #3204), on model group 3 only via #3202. See DASD/8809 feature description for limitations and prerequisites. On a 4331-1 or 2 delete #4910. On the 4331-11 feature #4910 is standard and does not need to be deleted. When #320X is ordered, this involves swapping of the adapter hardware without charge.
- 7) On the 4331-11 this feature is standard. To retain it on the 4361, add the feature in the MES order for record purpose only. If not ordered, the feature will be removed.

8) 8809 attachment on 4361 model group 4 and 5 is via any DASD/8809 adapter(#3201, #3202, #3203, #3204), on model group 3 via #3202 only.

9) For installation of these features the specified RPQ is required.

10) Feature is equivalent to RPQ ML4707 for 4331 model groups 1, 2, 11.

11) Cancel the RPQ and order the feature for record purposes (without charge on a purchased machine).

12 For 4321/4331 to be upgraded to 4361 and for 4361s shipped prior to April 1985, RPQ 7B0987 is required as prerequisites for #1200.

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with the 4361, order the feature number indicated below:

Book Rack and Cable Holder (#1480): Provides a book rack and cable holder.

Console Table (#1550): Provides a convenient table for the operator console and one 3278/3279 Display Station. Color is the same as the machine.

SUPPLIES (NONE)

4381 PROCESSOR

PURPOSE

Provides power, arithmetic, control, logic, memory and channels through one or two integrated instruction processing units for a 4381 processor system.

MODELS

The following models are removed from production:

Mdl Grp 1	Mdl Grp 2	Mdl Grp 3	Bytes of Processor Storage
L01	L02	---	4,194,304 Bytes
M01	M02	M03	8,388,608 Bytes
P01	P02	P03	16,777,216 Bytes
---	Q02	Q03	25,165,825 Bytes
---	R02	R03	33,554,432 Bytes

Memory model changes and feature additions will continue to be available for the Model Group 1, Model Group 2, and Model Group 3.

The following models are available:

Mdl Grp 11	Mdl Grp 12	Mdl Grp 13	Mdl Grp 14	Bytes of Processor Storage
L11	---	---	---	4,194,304 Bytes
M11	M12	M13	---	8,388,608 Bytes
P11	P12	P13	P14	16,777,216 Bytes
---	Q12	Q13	Q14	25,165,824 Bytes
---	R12	R13	R14	33,554,432 Bytes

Mdl Grp 21	Mdl Grp 22	Mdl Grp 23	Mdl Grp 24	Bytes of Processor Storage
M21	---	---	---	8,388,608
P21	P22	P23	P24	16,777,216
---	R22	R23	R24	33,554,432
---	---	S23	S24	50,331,648
---	---	T23	T24	67,108,864

Prerequisites: To provide the required system console, one of the following is required:

- One 3278-2A or 3279-2C console equipped with an operator console keyboard and an OCP.
- One 3205 console. An Operator Control Panel (OCP) on the 4381 is required for attachment of the 3205. This will be included on all 4381s.

A switch to enable/disable the optional channel-to-channel adapter is a part of OCP. It is active only if feature #1850, channel-to-channel adapter, is installed on the 4381.

A second console, although not required, will enhance systems operations for most customers and help increase system availability.

Note: The 3205 cannot be intermixed on the same processor with 3278-2A or 3279-2C consoles.

HIGHLIGHTS

The following model groups are uniprocessors with one instruction processing unit:

MG1
MG2
MG11
MG12
MG13
MG21
MG22
MG23

The following Model Groups are dual processors with two instruction processing units:

MG3
MG14
MG24

To improve the performance of the 4381 Processors running in S/370 Mode, the following assists and facilities are standard:

- Extended Control Program Support (ECPS) for MVS/SP Release 1.3 including cross memory services, the page fault assist function, and the ADDFRR instruction on all models.
- ECPS: VM for VM/SP with or without the VM/SP High Performance Option (HPO)
- Enhancements to ECPS: VM HPO on Mdl Grps 3, 12, 13, 14, 22, 23, and 24.
- Preferred Machine Assist to improve performance of MVS/SP Release 1.3 running under VM/SP with VM/SP HPO.

When the 4381 processor is operating in S/370 Extended Architecture (370-XA) mode, support is provided on all models by:

- MVS/XA
- VM/XA Systems Facility

There is support in both S/370 and S/370-XA mode for Engineering Scientific Processing as follows:

Engineering Scientific Assists:

- Multiply and Add Facility - all models
- Square Root Facility - all models
- Mathematical Function Facility - all models except Mdl Grp 1 and Mdl Grp 11.

Channels: There are six channels standard on the 4381 uniprocessor and six additional channels are available with the additions of feature #1870, Block Multiplexer Channels, Additional. For specific channel speeds by model, see the "IBM 4381 Uniprocessor Functional Characteristics Manual", GA24-3947.

There are twelve channels standard on the 4381 Dual Processors and six additional channels are available with the addition of feature #1871, Block Multiplexer Channels, Additional and a second six additional with feature Block Multiplexer Channels Second Additional (#1872) on the MG24 only. For specific channel speeds by model, see the "IBM 4381 Dual Processor Functional Characteristics Manual", GA24-4021.

Problem Determination Procedures: The Problem Analysis facility will be available on each 4381 Processor. Every user should be encouraged to take advantage of the benefits offered by Problem Analysis by invoking the procedure each time a machine failure occurs. Doing so will cause a set of routines to be executed by the system which will store failure data for later analysis and which will assist in isolating failing components. The benefit for the customer is that in many machine failure situations, it will not be necessary to await arrival of the CE to begin isolation of system problems, with the result of higher system availability for the customer. Use of Problem Analysis is a customer option. The capabilities of Problem Analysis are enhanced with the installation of one of the RSF features listed under "Specify", below.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

Power:

AC, 3-phase, 4-wire:	AC, 3-phase, 3-wire:
50 Hz	60 Hz
220V #2815	208V #9903
380V #2816	220V #2800*
400V #2825	240V #9915
415V #2826	

* Colombia, Peru, Taiwan, and the Philippines

(Japan only > Power (AC, 3-phase, 3-wire):

50 Hz	60 Hz
200V #2784	200V #2788
220V #2786	208V #2789
	240V #2793<

Machine Nomenclature:

Canadian (French) #2935
English US #2924
Japanese #2930
Portuguese (Brazil) #2933
Spanish #2931

Cabling: See 3278 mdl 2A Display Console or 3279 Color Display Console mdl 2C for console cabling.

Color: If no specify is selected, then the color of the 4381 Processor will be classic blue (#9063). If another color is required, specify: #9060 for willow green, #9061 for garnet rose, #9062 for sunrise yellow, #9064 for charcoal brown, #9065 for pebble gray.

Remote Support Facility (RSF): The RSF utilization is a customer option. It is recommended to enhance the hardware availability of the 4381 Processor. It provides service personnel the capability of remotely controlling the 4381 from any RETAIN terminal and allows the CE to access the RETAIN data bank for the latest service aids and information from the customer site. When RSF is used, the customer must provide the telephone lines required for the RSF modem.

(Except Canada and Japan > When specified, each processor will be equipped with either a CCITT Interface or 1200 bps Integrated Modem (switched network, manual answer) for the RSF. Specify #2838 for CCITT Interface or #2836 for 1200 bps Integrated Modem, switched network, manual answer.<)

(Canada only > Specify #9510 for integrated modem, 1200 bps, switched network, manual answer. A telephone set with exclusion key and with Data Access Arrangement (DAA), compatible with CDT Type Coupler Series 1000A interface and operation, is required.<)

Specify #9511 for EIA/CCITT Interface, 1200 bps switched network. This feature is used by both the RSF and the ROCF functions. An external modem compatible with the WE 202S modem, interface and operation, or equivalent is required. The external modem must include auto answer.<

(Japan only > Each processor requesting RSF will be equipped with either a CCITT Interface or 1200 bps Integrated Modem. Specify #2838 for CCITT Interface for Acoustic Coupler. Specify #2944 for 1200 bps Integrated Modem. Also specify #2943 for the NTTCA-2 Modem service cable connector.<)

Specify #2950 if no RSF feature is desired on the machine. Note: Use of RSF is integral to the maintenance strategy of the 4381, and all customers should have one of the RSF features installed.

For details on ordering and customer responsibilities, see Systems and Procedures Manual.

Remote Operator Console Facility (ROCF): The ROCF is an extension of RSF. It gives personnel at a host site the ability to dial-up and control a remote 4381 by means of host site programming support.

(Except Canada, Hong Kong, and Japan > Specify RSF feature #2836 for an integrated 1200 bps modem with auto answer capability or #2838 as CCITT Interface. CCITT Interface is for attaching customer-supplied or PTT-mandatory modems meeting CCITT recommendation V.23/V.24/V.28. The customer-supplied modem must include auto answer.<)

(Canada only > Specify #9511 for EIA-Interface, 1200 bps, switched network. This feature is used by both the RSF and the ROCF functions. An external modem compatible with the WE 202S modem, interface and operation, or equivalent is required. The external modem must include auto answer.<)

(Hong Kong only > Specify RSF feature #2838 as CCITT Interface and feature #2839. This interface is for attaching customer-supplied or PTT-mandatory modems meeting CCITT recommendation V.23, V.24, or V.28. The modem must include auto answer.<)

(Japan only > Specify RSF feature #2838 as CCITT Interface for Acoustic Coupler. The customer-supplied modem must include auto answer.<)

Note: Specify code #2836 operates in manual mode when used with RSF and auto answer mode when used with ROCF.

SPECIAL FEATURES

Channel-To-Channel Adapter (#1850): One channel-to-channel feature is optionally available to interconnect a 4381 Channel to a Channel on another processor (4300, System/370, 30XX or 9370). Only one of the processors requires this feature. Requires three control unit positions on each of the connected channels. Maximum: One. Field Installation: Yes. Prerequisites: Keyboard #4631 must be specified on the primary 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C. Three control unit positions on a block multiplexer channel. Specify: #2727 on the 3278 mdl 2A or 3279 Color Display Console mdl 2C. 76-Key Japanese English Operator Console Keyboard Channel-to-Channel, may be specified in lieu of #4631.

Block Multiplexer Channels, Add'l (#1870): (Uniprocessor) An optional group of six Block Multiplexer Channels. Maximum: One. Limitation: Not available on 4381 Mdl Grps 3 and 14. If installed on a 4381 uniprocessor, this feature must be deleted with an MES order entry for field conversion to a 4381 dual processor. Deletion of this feature is for record keeping only. Prerequisite: A 4381 uniprocessor. Field Installation: Yes.

Block Multiplexer Channels, Add'l (#1871): (Dual processor) An optional group of six Block Multiplexer Channels, three attached to each processing unit. Maximum: One. Limitation: Not available on 4381 uniprocessors. Prerequisite: A 4381 dual processor. Field Installation: Yes.

Block Multiplexer Channels Second Additional (#1872) (MG24 only): A second optional group of six block multiplexer channels, three attached to each processing unit. Maximum: One. Limitation: Only available on MG 24 dual processor. Prerequisite: A MG24 dual processor with feature #1871. Field Installation: Yes.

MODEL CONVERSIONS

The following 4381 Processor Field Upgrades are removed from production:

Model Group 1 to Model Group 2

MACHINES

Model Group 2 to Model Group 3

The following 4381 Processor Field Upgrades are available:

Model Group 1 to Model Group 12
Model Group 1 to Model Group 13
Model Group 2 to Model Group 13
Model Group 2 to Model Group 14
Model Group 3 to Model Group 14
Model Group 11 to Model Group 12
Model Group 12 to Model Group 13
Model Group 13 to Model Group 14
Model Group 1 to Model Group 22
Model Group 2 to Model Group 23
Model Group 3 to Model Group 24
Model Group 11 to Model Group 21
Model Group 11 to Model Group 22
Model Group 12 to Model Group 23
Model Group 13 to Model Group 23
Model Group 13 to Model Group 24
Model Group 14 to Model Group 24
Model Group 21 to Model Group 22
Model Group 22 to Model Group 23
Model Group 23 to Model Group 24

These upgrades require that the same or larger processor storage is selected. Memory model changes from a smaller to a larger size may be made in the field. Memory model changes from a larger to a smaller size and processor model downgrades are not recommended.

Note: RPQ S00602 is required for upgrade of a purchased 4381 uniprocessor to a 4381 dual processor when Block Multiplexer

Channels Additional (#1870) is not installed on the machine to be upgraded. The following upgrades are affected:

Model Group 2 to Model Group 14
Model Group 13 to Model Group 14
Model Group 13 to Model Group 24
Model Group 23 to Model Group 24

Installation of a change from one model to another may involve the removal of parts which become the property of IBM.

ACCESSORIES

An operator work station with modesty skirt has capabilities for two operators with two 3278 mdl 2A/3279 mdl 2C and room for reference material. Attachable book racks may be ordered for manual storage and also serve as a cable control device for the 3278 mdl 2A/3279 mdl 2C, telephones, etc. Table dimensions are 1590mm x 815mm and is equipped with gliders. The following items are available on a purchase-only basis. For field installation, order feature via MES. For shipment with machine, order the feature number indicated below.

Bookrack and Cable Holder (#1480): Up to four racks can be mounted on one table.

Console Table (#1550).

SUPPLIES (NONE)

4575 PROCESSOR

PURPOSE

The 4575 Processor is a System/88 High Availability/Horizontal Growth processor. Each 4575 Processor has twenty (20) attachment slots for memory, processor and controller boards. The processor also provides rack space for two 4580 Model 001 Disk Drives, one 4968 Autoload Streaming Magnetic Tape Unit, plus rack space in the rear of the cabinet for Communication Adapter Chassis, and Link Connectors.

The 4575 comes standard with duplicate power supplies and a battery backup for memory retention during short duration power failures. Major design points for the 4575 Processor are:

Fault Tolerance
Transaction Processing
Horizontal Growth

Duplexed components (including processors, memory, direct access devices, and controllers) and hot plugability provide a fault tolerant environment completely transparent to programmers and end-users.

System operations are performed through the attachment of an IBM Personal Computer.

Multiple S/88 processor modules (4575 Processor and 4576 Processors) can be interconnected to form a S/88 system via the S/88 Link facilities. Multiple S/88 systems can be interconnected to form a Network using the S/88 Network facilities. This ability to interconnect multiple S/88 processors and S/88 systems while maintaining a single system image provides a system with powerful horizontal growth capabilities. Depending on the mix of features installed, the 4575 has the capability to support the attachment of up to 128 communications ports, up to 6.7GB of duplexed direct access storage and up to 12MB of duplexed memory.

MODELS

Model 20B: The 4575 Processor Model 20B is offered in one standard configuration. The standard configuration includes a group of standard features. Special features may be added to the standard configuration to provide additional system capacity and function.

The 4575 contains an enclosure rack with duplexed power supplies, battery backup and 20 Central Electronic Complex (CEC) slots for memory, processors and controllers. It also contains rear rack space for Communications Adapter Chassis and Link Connectors. It is a multiprocessor capable of executing two instruction streams simultaneously. A model 20B processor board contains sets of paired microprocessors that are capable of executing two instruction streams simultaneously. In each pair, one microprocessor executes application instructions and the other executes operating system instructions.

All components on the 4575 Processor board, including the microprocessors, are also duplicated. As the two microprocessors are executing system and application instructions, another set of two microprocessors are executing exactly the same instructions. (Since the processor board is duplexed, there are two more pairs of micro-processors also executing the same instructions). The results produced by the two sets of micro-processors are continuously compared. If a discrepancy in the results is detected, the entire board is taken out of service. If one board is taken out of service, the partner board continues to process in a simplex fashion until the defective board is replaced. Integrated checking and comparator logic on each processor board provide high levels of integrity.

Configuration: The 4575 is only offered in one predetermined configuration. The standard configuration includes a group of standard features:

- 1 Streaming Tape Controller (1600/3200 BPI)
- Four Megabyte Memory w/controller (duplexed pair)

- Communications Controller (duplexed pair)
- 1 Communications Adapter Chassis
- 1 Remote Support Line/Clock Adapter
- 4580 DASD Controller (duplexed pair)

Additional components such as DASD devices, a tape unit, and an IBM PC must be ordered separately to complete the system. In addition, special features may be added to the system to expand the Model 20B growth capability.

HIGHLIGHTS

- **Hardware Implementation of Fault Tolerance:** The S/88 provides Fault Tolerant Processing by combining hardware components with logic circuitry that continually checks for errors and by providing duplexed components that operate in parallel. Duplexed components that fail are automatically taken out of service without affecting system performance or operations.
- **Duplexed Configurations:** Every major component (except tape) is duplexed in a S/88 processor configuration. Duplexed processor boards, memory boards, and communications controller boards execute in synchronization, continually comparing results with their partner to maintain data integrity and to provide a backup in cases of component failure. Duplexed disk drives and controllers operate in synchronization under control of the operating system providing backup to each other in case of failure. Duplicate Link Controllers and cabling components provide double the capacity of one link during normal operation and a backup link in the event of failure.
- **Hot Plugability:** This feature permits S/88 components to be removed or replaced during full system operation without affecting system operations or requiring power shut down. This feature allows most failing components to be repaired or replaced while complete system operation remains intact.
- **Data Integrity:** The duplexed S/88 components and the S/88 software help to maintain data integrity. Data integrity is a standard feature integrated into the S/88 hardware and software.
- **Distributed Processing:** Multiple S/88 processor modules can be interconnected via the S/88 Link. This ability to interconnect multiple S/88 modules while constantly maintaining a single system image of the available resources, provides a distributed processing environment transparent to the end user.
- **Horizontal Growth:** Additional processors and their attached resources (i.e., memory, DASD and peripherals) can be added to existing S/88 systems via the S/88 Link facility without interrupting system operations. Once the new processor is attached to the S/88 Link, all of its resources become available to the other processors within the System.
- **Continuous Hardware Component Checking:** Hardware operations are continuously checked on all S/88 processor, memory and controller boards. This continuous checking is generally implemented by duplexed circuitry contained on the board itself. This approach of continuous checking for operational and data errors provides for instantaneous detection of malfunctions, maintaining both operational and data integrity.
- **Remote/Automatic Service:** The error detection functions described above automatically remove failing components from service. At removal time, diagnostics are automatically run on the failing component and the component is placed back into service if diagnostics show no failure. If the diagnostics determine that a CEC component has a hard failure, the S/88 will automatically call the S/88 Support Center and report the problem. The S/88 Support Center will then diagnose the problem and, if required, will express ship a replacement component to the customer site. Automatic calls are also

placed to the S/88 Support Center whenever limits are exceeded on soft CEC component failures.

Customer Responsibilities: The customer is responsible for:

1. Understanding the management of the design, installation and control of System/88 as described in the System/88 publications.
2. Designing and implementing user application as necessary.
3. Carrying out approved problem determination and resolution in conjunction with the IBM System/88 Support Center.
4. Providing a data link to the IBM System/88 Support Center.
5. Installing service level updates and fixing as appropriate.
6. Operating the System/88 in a duplexed configuration.
7. Ensuring that the Personal Computer to be used as the system console has been set up prior to System/88 installation.

Problem Determination: Initial problem determination actions will be automatically performed by the System/88. If the System/88 is under a service contract or under warranty, failing CEC components will cause the System/88 to automatically notify the System/88 Support Center. When, as a result of a Customer Problem Analysis and Resolution procedure performed either automatically by the System/88 Support Center and/or on-site by the customer, the identified failing unit is one of the Customer Replaceable Units, the customer will be informed that IBM will arrange pickup of the failing unit and delivery of a unit in good working order. The customer is responsible for removal of the failing unit, for the installation and verification of the delivered unit.

In all other cases, the customer may call an IBM Customer Engineering service number to request on-site assistance which will be provided at the applicable hourly rates and terms and conditions.

Security, Auditability and Control: User Management is responsible for evaluation, selection, and implementation of security features, for administrative procedures, and for appropriate controls in application system. If sensitive data is sent over external communication facilities, user management may wish to consider the application of cryptography.

Configuration: The System/88 and its associated I/O devices provide considerable flexibility and expandability. Contact your IBM Marketing Representative for assistance in developing a configuration that meets your application and performance needs.

System Console Function: An IBM Personal Computer or IBM Personal Computer XT, or their equivalent, must be used as the system console (monitor terminal) for each processor module in a System/88. Refer to the System/88 IBM Personal Computer Terminal Program Product (5732-019) for additional information and prerequisites.

Exchange, rather than repairing in place, is the recommended service philosophy for the Personal Computer to be used as the System Console.

The Personal Computer must be set up by the customer prior to System/88 installation.

SPECIFY

- Power Cord: Standard 4.3m (14 ft.). All devices mounted within the processor cabinet receive power from the processor cabinet.
- Power (AC, 1-phase): Specify the following:
 60 Hz
 120V #9911

SPECIAL FEATURES

4580 DASD Controller (#1000): (NO LONGER AVAILABLE) This Direct Access Storage Device (DASD) Controller provides system control and management for the 142MB 4580 Disk Drives. The controller interfaces directly to the 4580 Disk Drives. Each controller supports up to four 4580 Disk Drives. Each controller requires one CEC slot. The 4580 DASD Controllers must be ordered in duplexed pairs. Corequisite: A 4580 Model 001 Disk Drive. Field Installation: Yes. Maximum: Four (4) duplexed pairs of 4580 DASD Controllers (eight #1000) can be attached to the 4575 and a maximum of 32 physical 4580 Model 001 Disk Drives can be spread across the controllers. One duplexed pair of DASD controllers is included as a standard feature on the 4575. Minimum: A S/88 processor module must be configured with a minimum of one duplex pair of Disk Drives.

4581 DASD Controller (#1010): (NO LONGER AVAILABLE) This Direct Access Storage Device (DASD) Controller provides system control and management for the 448MB 4581 Disk Drives. The controller interfaces to the 4581 DASD Director (#1011) which then interfaces to the 4581 Disk Drive. Each 4581 DASD Controller (#1010) supports a maximum of eight 4581 DASD Directors (#1011) and receives its power from the S/88 processor. Each 4581 DASD Controller (#1010) requires one CEC slot. The 4581 DASD Controller (#1010) must be ordered in duplexed pairs. Co-requisite: A 4581 DASD Director (#1011). Field Installation: Yes. Maximum: Three (3) duplexed 4581 DASD Controller pairs (six # 1010) can be attached to a 4575, and a maximum of 32 physical 4581 Disk Drives can be spread across the controllers. Minimum: A S/88 Processor Module must be configured with a minimum of one duplex pair of Disk Drives.

4580 DASD Controller (#1020): (NO LONGER AVAILABLE)

This direct access storage device (DASD) controller provides system control and management for the 142MB 4580 Disk Drives. The controller interfaces directly to the 4580 Disk Drives. Each controller supports up to four 4580 Disk Drives. Each controller requires one Central Electronic Complex (CEC) slot. The 4580 DASD Controllers must be ordered in duplexed pairs. The co-requisite for a controller is a 4580 Disk Drive. Limitations: Four duplexed pairs of #1020s can be installed on a 4575 Processor. Each 4575 must be configured with a minimum of one duplexed pair of 4580 Disk Drives. Field Installation: Yes.

A maximum of four duplexed 4580 DASD Controllers can be attached to a 4575 mdl 20B and a maximum of 16 duplexed 4580 Disk Drives can be spread across the controllers. One pair of 4580 DASD Controllers is standard on the 4575 mdl 20B.

4581 DASD Controller (#1030): This direct access storage device (DASD) controller provides system control and management for the 448MB 4581 Disk Drives. The controller interfaces to the 4581 DASD Director Feature (#1011), which then interfaces to the 4581 Disk Drive. Each 4581 DASD Controller supports a maximum of eight 4581 DASD Directors. Each 4581 DASD Controller requires one CEC slot. The 4581 DASD Controllers must be ordered in duplexed pairs. The co-requisite for a 4581 DASD Controller is a 4581 Disk Drive equipped with a DASD Director (#1011). Installed #1011s will operate with the new #1030 Controller without modification. Limitations:

Three duplexed pairs of #1030s and 16 duplexed pairs of 4581 Disk Drives can be installed on a 4575 Processor. Field Installation: Yes.

4968 Streaming Tape Controller (#1100): The Streaming Tape Controller provides system management and control for one 4968 Autoload Streaming Magnetic Tape Unit. The controller cables directly to the 4968 tape drive. This controller is available as a simplex controller only. Each controller requires one CEC slot. Corequisite: A 4968 Autoload Streaming Magnetic Tape Unit. Field Installation: Yes. Maximum: The S/88 supports a maximum of four (4) tape controllers. One Streaming Tape Controller for the 4968 tape unit is included as a standard feature on the 4575 Model 20B.

4585 Streaming Tape Controller (#1110): The Streaming Tape Controller provides system management and control for one IBM 4585 Autoload Magnetic Tape Unit, Model 001. The controller cables directly to the 4585 tape drive. The controller is available as a simplex controller only. Each controller requires one CEC slot. Co-requisite: a 4585 Autoload Magnetic Tape Unit, Model 001. Field Installation: Yes. Maximum: The S/88 supports a maximum of four (4) tape controllers.

Communications Controller (#1200): A duplexed pair of Communication Controllers supports a maximum of one Communication Adapter Chassis (#1220) and one Communications Adapter Expansion Chassis (#1230). With these two adapter chassis the duplexed communications controller pair can support up to sixteen line adapters. These adapters can support combinations of asynchronous, binary synchronous, X.25, and SDLC lines. Each controller receives power from the S/88 processor and requires one CEC slot. Communications Controllers (#1200) must be ordered in duplexed pairs. Corequisites: Communications Adapter Chassis (#1220) and at least one line adapter (Feature #1201, #1202, #1203, #1204, #1205, #1206, or #1207). Field Installation: Yes. Maximum: Four (4) duplex communications controller pairs (eight #1200) can be installed in a 4575. A duplexed pair of Communications Controllers is included as a standard feature of the 4575 Model 20B.

Full Modem Asynchronous Line Adapter (#1201): The Full Modem Asynchronous Line Adapter provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 9.6K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). Each port on the card provides the signals required for remote communications via a modem (using cable #1801). The adapter uses cable #1801 for attachment to external modem devices. The adapter can also be used in conjunction with a crossover cable (#1816) to provide direct connection of peripheral devices such as terminals and printers. The direct connect capability can be achieved using either cable #1816 and #1806 for attaching to an IBM PC or a terminal with a male connector or #1816 plus #1802, #1803, or #1804 for attaching to a terminal with a female connector. Field Installation: Yes.

Direct Connect Asynchronous Line Adapter (#1202): The Direct Connect Asynchronous Line Adapter provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 9.6K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). The adapter can be used with direct connect communication cables (#1802, #1803, #1804) providing for local attachment to terminals and printers with a female connector, or it can be used with the direct connect cable (#1806) for providing local attachment of the IBM PCs. Field Installation: Yes.

Direct Connect Printer Adapter (#1203): The Direct Connect Printer Adapter provides one port for connection of a line printer. The adapter requires one slot in the Communications Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communications Controller (#1200). The adapter is used with direct connect twinaxial cable (#1819, #1820) for providing local attachment of the printer. For distances 15m (50 ft.) or less, the Printer Connect Cable #1819 is required. Distances greater than 15m (50 ft.) but less than 930m (3000 ft.) require the Printer Connect Cable #1820, 0.3m (1 ft.), and a customer supplied twinaxial extension cable. Field Installation: Yes. Twinaxial Cable Specifications: Refer to GA24-4028 for the 5262 or GA21-9337 for the 4245.

The System/88 Operating System (Release 2) supports the IBM 5262 Line Printer (Model 1) and the IBM 4245 Line Printer (Model T20) with the following print bands:

5262 Line Printer

Character Set	Specify	
	A	B
48 International	#2767	#2950
63 International	#9523	#2950
64 International	#2768	#2950
96 International	#2770	#2950

4245 Line Printer

Character Set	Specify	
48 International	#9520	#2950
63 International	#9524	Not req.

Remote Support Line/Clock Adapter (#1204): One Support Line/Clock Adapter is included as a standard feature of the 4575 Model 20B. Since it is included as a standard feature, it is not necessary to order the #1204 separately unless needed as a spare in the event of failure. One adapter (#1204) is required per S/88 system. If multiple processor modules are interconnected via the Link Controller (#1400), only one adapter (#1204) is required. If more than one adapter (#1204) exists only one can be active in each S/88 system. The Remote Support Line/Clock Adapter provides one line port for the Support Modem (#1300) used for remote system support. This adapter also provides a battery powered system clock that is accessed only during a module power up. This adapter requires one slot and must be located in the last slot (slot #7) of the first Communication Adapter Chassis (#1220). Connection to the support modem is via a modem cable (cable #1801). Power is supplied to the adapter from the Communication Controller (#1200). Field Installation: Yes.

High Performance Full Modem Synchronous Line Adapter (#1205): Provides one RS-232-C or RS-422 line port. The maximum bit rate is 19.2K bps. The adapter supports bisync, SDLC, and X.25 protocols and requires one slot in a Communication Adapter Chassis (#1220) or Expansion Chassis (#1230). Power for the adapter is supplied via the cables from the Communication Controller (#1200). Modem Cable #1801 is required for modem support. The adapter can also be used in conjunction with the Crossover Cable (#1815) or a customer supplied RS-422 cable to provide direct connection of synchronous terminal devices. Field Installation: Yes.

High Performance Direct Connect Asynchronous Line Adapter (#1206): The High Performance Direct Connect Asynchronous Line Adapter (#1206) provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 19.2K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). The adapter can be used with direct connect communication cables (cables #1802, 1803, 1804) providing for local attachment to terminals and printers with a female connector or with the direct connect cable (#1806) for local attachment of the IBM PCs. Field Installation: Yes.

High Performance Full Modem Asynchronous Line Adapter (#1207): The High Performance Full Modem Asynchronous Line Adapter (#1207) provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 19.2K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communications Controller (#1200). Each port on the card provides the signals required for remote communications via a modem (using cable #1801). The adapter can also be used in conjunction with the crossover cable (#1816) to provide direct connection of peripheral devices such as terminals and printers. The direct connect capability can be achieved using either cable #1816 and #1806 for attaching to an IBM PC or a terminal with a male connector, or #1816 plus #1802, #1803, or #1804 for attaching to a terminal with a female connector. Field Installation: Yes.

Communications Adapter Chassis (#1220): The Communications Adapter Chassis provides slots for attaching the communication

line adapter cards. One chassis connects to a duplexed pair of Communications Controllers (two #1200). Each chassis supports the attachment of up to eight (8) line adapter cards, (#1201, #1202, #1203, #1204, #1205, #1206 or #1207). A maximum of seven of the cards can be high performance adapter cards (#1203, #1205, #1206, or #1207). Power for Line Adapter Cards is provided by the Communications Controller (#1200) through the chassis. Connectors and fault indicators are provided for each slot in the Communication Adapter Chassis (#1220). The chassis can be physically mounted in the rear rack of a 4575, or in the front or rear rack of a 4577 Expansion Cabinet. Prerequisites: A duplexed pair of Communications Controllers (two #1200). Field Installation: Yes. Maximum: A total of six (6) Communications Adapter Chassis (#1220) and Communications Adapter Expansion Chassis (#1230) can be mounted in the rear rack of a 4575. A 4577 Expansion Cabinet may be required to attach additional Communication Adapter Chassis (#1220) or Communications Adapter Expansion Chassis (#1230). One Communications Adapter Chassis (#1220) is included as a standard feature of the 4575 Model 20B.

Communication Line Adapter to Communication Adapter Chassis Assignment (#1220): Specify Line Adapter feature type and quantity and Communication Adapter Chassis (#1220) sequence as #8XYZ where:

'X' = the sequence number of the Communication Adapter Chassis (#1220) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet,

'Y' = the last digit (1 - 7) of the Communication Line Adapter feature number (#1201 - #1207)

'Z' = the quantity of that particular Communication Line Adapter Feature to be installed in this Communication Adapter Chassis (#1220)

A separate specify code is required for each feature type (#1201 - 1207) ordered for installation in this Communication Adapter Chassis (#1220). For example, an order that included 2 each - #1201, 1 each - #1202, 1 each - #1203, 2 each - #1205, for installation in the 2nd Communications Adapter Chassis (#1220) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet, would require the following Specify Codes:

#8212 (2 each - #1201)
#8221 (1 each - #1202)
#8231 (1 each - #1203)
#8252 (2 each - #1205)

Communications Adapter Expansion Chassis (#1230): The Communication Adapter Expansion Chassis provides slots for an additional eight communication Line Adapters, only seven of which can be high performance adapters. Power for line adapter cards located in the Communications Expansion Chassis (#1230) is provided by the Communication Controller (#1200) via the Communications Adapter Chassis (#1220). Connectors and fault indicators are provided for each slot in the chassis. Prerequisites: A duplexed pair of Communications Controllers (two #1200) and a Communications Adapter Chassis (#1220). Field Installation: Yes. Limitations: Only one Communications Adapter Expansion Chassis can be connected to a Communications Adapter Chassis (#1220).

Communication Line Adapter to Communication Adapter Expansion Chassis (#1230): Specify Line Adapter feature type and quantity and Communication Adapter Expansion Chassis Assignment (#1230) sequence as #9XYZ where:

'X' = the sequence number of the Communication Adapter Expansion Chassis (#1230) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet

'Y' = the last digit (1 - 7) of the Communications Line Adapter feature number (#1201 - #1207)

'Z' = the quantity of that particular Communication Line Adapter Feature to be installed in this Communication Adapter Expansion Chassis (#1230)

A separate specify code is required for each feature type (#1201 - 1207) ordered for installation in this Communication Adapter Expansion Chassis (#1230). For example, an order that included 2

each - #1201, 1 each - #1202, 1 each - #1203, 2 each - #1205, for installation in the 2nd Communications Adapter Expansion Chassis (#1230) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet, would require the following Specify Codes:

#9212 (2 each - #1201)
#9221 (1 each - #1202)
#9231 (1 each - #1203)
#9252 (2 each - #1205)

Link Controller (#1400): The Link Controller provides control and management for the local inter-system communication. The controller interfaces directly to the Link Connector (#1410) via the Link Cables #1808, 1809, 1810, or 1811, or customer supplied cables. The controller provides transmit and receive protocol management for the 1.4MB serial interface. The controller requires one CEC slot. Link controllers must be ordered as duplex pairs so that a single failure will not prevent inter-processor communication. The continuous aggregate bandwidth of an operational pair of controllers approaches 2.8MB per second for the duplexed pair. Only one (1) Link Controller pair (two #1400) is required to attach a processor module to the S/88 Link, hence one (1) Link Controller pair (two #1400) is the maximum that can be configured on a S/88 processor. Field Installation: Yes.

Link Connector (#1410): The Link Connector is a passive device that provides cable connection points for the interconnection of up to six Link Controllers (#1400) on a S/88 Link. Attachment of more than six Link Controllers (#1400) to a S/88 Link requires the interconnection of two or more Link Connectors (#1410) in series. Each additional Link Connector (#1410) attached to the S/88 Link requires a cable connection point on the Link Connector (#1410) it is being attached to, a 4591 Link Extender and one of its own cable connection points. All Link hardware components (Controllers, Connectors, Extenders, and Cables) must be ordered in pairs to achieve fault tolerant operation. A fully configured S/88 system, consisting of 32 Link connected Processor Modules, requires 32 Link Controller pairs (64 #1400s), eight (8) Link Connector pairs (16 #1410s), seven (7) 4591 Link Extender pairs (14 - 4591 Link Extenders) and associated cable pairs. The Link Connector can be mounted in the rear rack of a S/88 Processor Cabinet or the front or rear rack of a 4577 Expansion Cabinet. Duplex Link Connectors (#1410) should be installed in adjacent Cabinet positions. The maximum distance between a Link Controller (#1400) and Link Connector (#1410), without the use of the 4591 Link Extender is 750 ft. Link Connectors (#1410) should be installed in the Processor Module closest to the physical center of the S/88 Link structure to minimize cabling requirements. Additional processors can be added dynamically to the Link, providing on-line growth to the link structure without impacting function. The two foot Link Cable (#1808) is used within the S/88 Processor Cabinet that houses the Link Connector (#1410) for connection between that processor's Controllers (#1400) and Connectors (#1410). The ten foot Link Cable (#1809) is used if the Link Connector (#1410) is located in a 4577 Expansion Cabinet adjacent to a Processor Cabinet. Otherwise the 15m (50 ft) Link Cable #1810 should be used for greater distances. Prerequisites: A Link Controller (#1400). Field Installation: Yes.

Mounting Location:

#9001 - Under covers installation
#9002 - Wall Mount

Two Megabyte Memory (#1500): (NO LONGER AVAILABLE) The Two Megabyte Memory feature provides memory control, error detection and correction for two megabyte of system memory. The feature also provides the system bus level checking and management logic required for the fault tolerant system operation. The feature is a two board package, requiring two CEC slots. Power for both boards is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. This feature must always be ordered in duplexed pairs (two #1500). Field Installation: Yes.

Four Megabyte Memory (#1510): The Four Megabyte Memory feature provides memory control, error detection and correction for

4MB of system memory. The feature also provides the system bus level checking and management logic required for the fault tolerant system operation. The feature is a three board package, requiring three CEC slots. Power for all boards is received on the lowest of the three boards, allowing the entire package to be powered from one of the duplexed system power supplies.

This feature must always be ordered in duplexed pairs (two #1510). Field Installation: Yes. A duplexed pair of Four Megabyte Memory Features is included as a standard feature in the 4575 Model 20B. The 4575 supports a maximum of 12MB of duplexed memory.

Eight Megabyte Memory (#1530): Provides memory control, error detection and correction for 8MB of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. The feature is a two-board package, requiring two CEC slots. Power is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. This feature must always be ordered in duplex pairs.

Limitation: The 4575 mdl 20B is configured with 4MB of duplexed memory. Additional memory features may be added by ordering duplexed pairs of feature #1510 (4MB) or #1530 (8MB). The 4575 mdl 20B has a maximum capacity of 12MB of duplexed memory. A maximum of two duplexed memory features may be installed in a 4575 mdl 20B. Field Installation: Yes.

Cable Order: The following cables and connectors are available from IBM for use with the 4575 by ordering the indicated feature numbers. These feature numbers are the only way that cables and connectors can be ordered.

For attachment of Full Modem Adapter to Modem:

#1801 - Full Modem Communication Cable - 7.5m (25 ft)

For attachment of asynchronous terminals to Direct Connect Adapters

#1802 - Direct Connect Communication Cable - 15m (50 ft)

#1803 - Direct Connect Communication Cable - 45.5m (150 ft)

#1804 - Direct Connect Communication Cable - 76m (250 ft)

#1806 - Direct Connect Cable for IBM Personal Computer - 7.5m (25 ft)

For inter-processor connection of System/88 processors

#1808 - Link Cable - 0.6m (2 ft)

#1809 - Link Cable - 3m (10 ft)

#1810 - Link Cable - 15m (50 ft)

#1811 - Link Cable - 30.5m (100 ft)

For terminal connections:

#1814 - Remote Terminal to Remote Modem Cable - 7.5m (25 ft)

#1815 - Synchronous Crossover Cable (Eliminates the need for modems for local Synchronous Devices) - 0.3m (1 ft)

#1816 - Asynchronous Crossover Cable (Eliminates the need for modems for local Asynchronous Devices) - 0.3m (1 ft)

For line printer

#1819 - Printer to Direct Connect Printer Adapter Cable - 15m (50 ft)

#1820 - Printer to Direct Connect Printer Adapter Cable (For connection to a customer supplies twinaxial extension cable for distances greater than 15m (50 ft) but less than 930m (3,000 ft) - 0.3m (1 ft)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

4576 PROCESSOR

PURPOSE

The 4576 Processor is a System/88 High-Availability/Horizontal Growth processor available in seven models. Each 4576 Processor has 40 attachment slots for memory, processor, and controller boards. The 4576 comes standard with duplicate power supplies, equipped with battery backup for memory retention during brief power failures.

MODELS

Model 040: A multiprocessor capable of executing 4 instruction streams simultaneously.

A Model 040 processor board contains two sets of four microprocessors to process system and application functions. All other components on a Model 040 board are also duplicated. As the primary four microprocessors are executing instructions, the other set of four microprocessors are executing exactly the same instructions. (Since the processor board is duplexed, there are two more sets of four microprocessors also executing the same instructions). The results produced by the two sets of four microprocessors are continuously compared. If a discrepancy in the results is detected, the entire processor board is taken out of service and the partner board continues to process in a simplex fashion until the defective board is replaced. Integrated checking and comparator logic on each processor board provides high levels of integrity.

Depending upon the mix of features installed, the Model 040 can support from 4 to 64Mb of duplexed memory, up to 256 communications ports, and up to 6.7Gb of duplexed direct access storage.

Model 050: Model 050 processor board contains four duplexed Motorola MC68020 microprocessors, capable of executing 4 instruction streams simultaneously to process system and application functions.

Each processor board is duplexed to provide fault tolerant function. Integrated checking and comparator logic on each processor board provides high levels of integrity. As the primary four microprocessors on a board are executing instructions, the other set of four microprocessors on the board are executing exactly the same instructions. (Since the processor board is duplexed, there are two more sets of four microprocessors also executing the same instructions.) The results produced by the two sets of four microprocessors are continuously compared. If a discrepancy in the results is detected, the entire processor board is taken out of service and the partner board continues to process in a simplex fashion until the defective board is replaced. The processor board can be replaced dynamically if a permanent failure occurs.

The Model 050 operates with the memory and controllers used on current models of the 4576 Processor and uses a 16-bit wide data and instruction path. The Model 050 chassis is designed to accommodate a 32-bit wide path and new memory features required by Models 081 through 084. This enables the Model 050 to be upgradable to a Model 081, 082, 083, or 084.

Depending upon the mix of features installed, the Model 050 can support from 8Mb to 64Mb of duplexed memory, up to a maximum of 256 communications ports, and up to 6.7Gb of duplexed direct access storage.

The Model 050 is source software compatible with other System/88 processors models.

Model 060: A multiprocessor capable of executing 6 instruction streams simultaneously.

A Model 060 processor board contains two sets of six microprocessors to process system and application functions. All other components on a Model 060 board are also duplicated. As the primary six microprocessors are executing instructions, the other set

of six microprocessors are executing exactly the same instructions. (Since the processor board is duplexed, there are two more sets of six microprocessors also executing the same instructions.) The results produced by the two sets of six microprocessors are continuously compared. If a discrepancy in the results is detected, the entire processor board is taken out of service and the partner board continues to process in a simplex fashion until the defective board is repaired and replaced. Integrated checking and comparator logic on each processor board provides high levels of integrity.

Depending upon the mix of features installed, the Model 060 can support from 8 to 64Mb of duplexed memory, up to 256 communications ports, and up to 6.7Gb of duplexed direct access storage. The Model 060 has a 48Kb high-speed memory cache, and separate on-board microprocessors for arithmetic assist for both floating point and packed decimal arithmetic functions.

Models 081 through 084: The processor board used in Models 081 through 084 contains one set of duplexed Motorola MC68020 microprocessors, which are enhanced through the use of an on-board 16K by 32-bit data and instruction cache. There is also an on-chip 64 by 32-bit instruction cache. A tightly coupled Motorola MC68881 co-processor for each MC68020 provides high performance floating point arithmetic capabilities that supplements the MC68020 instruction set.

Each processor board is duplexed to provide fault tolerant function. Integrated checking and comparator logic on each processor board provides a high level of integrity. As the primary microprocessor on the board is executing instructions, the other microprocessor on the board is executing exactly the same instructions. The results produced by the two microprocessors are continuously compared. If a discrepancy in the results is detected, the entire processor board is taken out of service and the partner board continues to process in a simplex fashion until the defective board is repaired or replaced. The processor board can be replaced dynamically if a permanent failure occurs.

The architecture of Models 081 through 084 provides an expandable family of products. Upgrade of a Model 081, 082, or 083 to the next higher Model is accomplished by inserting an additional set of duplexed processor boards into the pre-allocated, pre-wired Central Electronic Complex (CEC) slots in the processor cabinet. This upgrade can be performed dynamically, without 're-booting' the processor module.

Models 081 through 084 use a new 32-bit wide memory which complements their high performance. The new memory uses 256K Dynamic RAM chips and has the ability to transfer up to 64-bits of data in a single cycle. Data is Error Correction Code protected. Single-bit errors are corrected and logged; double-bit errors are detected. Memory also is duplexed. The memory package can be replaced dynamically if a permanent failure occurs.

Depending upon the mix of features installed, Models 081 through 084 can support 8Mb to 64Mb of duplexed memory, up to 256 communications ports, and up to 6.7Gb of duplexed direct access storage.

Models 081 through 084 are source software compatible with other IBM System/88 processor models and provide an upgrade path for Model 050 customers.

Model Specifics: In mixture of applications, based on internal testing, performance can be the following:

# Physical Boards per Processor Set		# CEC Slots Required for Duplexed Processor Boards	
# Logical Processors		Performance Relative to Model 060	
4576			
Model	v	v	v
050	4	1	2 Up to 0.90

081	1	1	2	Up to 0.75
082	2	2	4	Up to 1.5
083	3	3	6	Up to 2.0
084	4	4	8	Up to 2.5
060	6	3	6	1.0

Additional performance data has been measured running an ET1 benchmark. The new Model 084 provides approximately 3 times the ET1 performance of the Model 060. An ET1 benchmark is one of the measures of performance in the high availability online transaction processing environment. The results reflect performance in a low physical I/O environment and do not necessarily provide information about balanced system performance. The ET1 benchmark consists of Debit/Credit transactions that may not represent any particular Debit/Credit environment. In addition, benchmark parameters and implementations vary from test to test. Therefore, the results of this benchmark should be used in conjunction with other inputs to make relative comparisons between different models and/or software releases of the System/88.

Note: Individual customer results may vary. The System/88 model performance for any one customer installation will depend on factors such as the number of users, their specific workload profiles, system capacity, and processor utilization.

Limitations:

Model 050: Of the 40 Central Electronic Complex (CEC) slots in the 4576 Processor cabinet, up to 36-slots may be used on the Model 050 for processor, memory, and controller boards.

Models 081, 082, 083, and 084: Of the 40 Central Electronic Complex (CEC) slots in the 4576 Processor chassis, up to 36-slots may be used on Model 081 through 084 for processor, memory, and controller boards. For example:

- An 8Mb Model 081 will use four CEC slots for duplexed memory and two CEC slots for one set of duplexed processor boards. Six more CEC slots are allocated and pre-wired for processor additions to allow upgrading to a Model 082, 083, or 084 when desired. Up to 24 CEC slots remain available for DASD, communications, tape, and link controllers, and for additional memory. In this configuration, the four remaining slots (of the total of 40 in the chassis) have no power connection and will remain unoccupied.
- A 64Mb Model 084 will use 12 CEC slots for duplexed memory and eight CEC slots for four sets of duplexed processor boards. Up to 16 CEC slots remain available for DASD, communications, tape, and link controllers. In this configuration, the four remaining slots (of the total of 40 in the chassis) have no power connection and will remain unoccupied.

HIGHLIGHTS

- Data Integrity
- Duplexed Components
- Hardware Implementation of Fault Tolerance
- Remote/Automatic Service
- Hot Plugability
- Customer-Replaceable Processors, Memory, and Controllers
- Parallel Processing
- Distributed Processing
- Horizontal Growth
- Vertical Growth

DESCRIPTION

Duplexed components (including processors, memory, direct access devices, and controllers) and hot plugability provide a fault tolerant environment completely transparent to programmers and end-users.

Multiple IBM System/88 processors can be interconnected to form an IBM System/88 System via the IBM System/88 Link facilities. Multiple System/88 Systems can be interconnected to form a Network using the System/88 Network facilities. This ability to inter-connect multiple System/88 processors and System/88 Systems together, while constantly maintaining a single system image, provides a system with significant horizontal growth capabilities.

Depending on mix of features installed, the 4576 has the capability of supporting the attachment of up to 256 communication ports, up to 6.7Gb of duplexed direct access storage, and 64Mb of duplexed main memory.

The 4576 Processor consists of an enclosure rack with duplexed power supplies, battery backup for memory retention during brief power failures, and 40 Central Electronic Complex (CEC) slots for processors, memory, and controllers. The 4576 Processor also contains rear rack space for Communications Chassis and Link Connectors. Every 4576 Processor requires a least one 4577 Expansion Cabinet.

- **Data Integrity:** Duplexed System/88 components and System/88 software help maintain data integrity. Data integrity is a standard feature integrated into the System/88 hardware and software. Data is ECC-protected and can correct a single-bit error and can also detect double-bit errors.
- **Duplexed Components:** Every major component (except tape) is duplexed or duplicated in a System/88 configuration. Duplexed processor boards, memory boards, and communications controller boards execute in synchronization, continually comparing results with their partner to maintain data integrity and to provide a backup in cases of component failure. Duplexed disk drives and controllers operate in synchronization under control of the operating system providing backup to each other in case of a failure. Duplicate Link Controllers and cabling components provide double the capacity of one link during normal operation and a backup link in the event of a failure.
- **Hardware Implementation of Fault Tolerance:** The System/88 provides fault tolerant processing by combining duplexed hardware components with logic circuitry that continually checks processor, memory, and controller boards for errors. This approach of continuous checking for operational and data errors provides for instantaneous detection of malfunctions, maintaining both operational and data integrity. The checking is generally implemented by duplexed circuitry contained on the board itself. Comparative logic circuits compare the results of duplicated components on the board.

If differences occur in a comparison, the failing board is taken out of service, without affecting system performance or operations, and forced into self-checking diagnostic mode.

- **Remote/Automatic Service:** The error detection functions described above automatically remove failing components from service. At removal time, diagnostics are automatically run on the failing component and the component is placed back into service if the failure does not recur. If the diagnostics determine that a CEC component has a permanent failure, the System/88 will automatically call the System/88 Support Center and report the problem for systems under warranty or covered by an IBM Maintenance Agreement. Automatic calls are also placed to the System/88 Support Center whenever limits are exceeded on soft CEC component failures.

The System/88 Support Center will diagnose the problem and, if required, express ship a replacement component to the customer site.

- **Hot Plugability:** This feature permits System/88 CEC components to be removed or replaced during full system operation

without affecting system operations or requiring power shut down. This feature allows most failing components to be repaired or replaced while complete system operation remains intact.

- **Customer-Replaceable Processors, Memory, and Controllers:** All CEC components (processor, memory, and controller boards) are Customer-Replaceable Units (CRU). That means when a hard failure occurs and a replacement component is received at the system site, there is no requirement for service personnel. A CRU can be replaced in minutes without special tools, and without system interruption.
- **Parallel Processing:** Multiple microprocessors in the Models 040, 050, 060, 082, 083, and 084 operate in parallel processing mode, and share the workload in a non-hierarchical fashion.
- **Distributed Processing:** Multiple System/88 Processor Modules can be inter-connected via the System/88 Link. This ability to inter-connect multiple System/88 modules while constantly maintaining a single system image of the available resources, provides a distributed processing environment transparent to the end-user.
- **Horizontal Growth:** Additional processors and their attached resources (i.e., memory, DASD, and peripherals) can be added to existing System/88 systems via the System/88 Link facility without interrupting system operations. Once the new processor is attached to the System/88 Link, all of its resources become available to the other processors within the System.
- **Vertical Growth:** System/88 architecture and design of Models 081 through 084 allow processor boards to be added to a Model 081, 082, or 083 to enable vertical processor growth when needed. The System/88 can grow from Model 050 to Model 081, 082, 083, or 084.

Customer Responsibilities: The customer is responsible for:

1. Understanding the management of the design, installation, and controlling of System/88 as described in the System/88 publications.
2. Designing and implementing user applications as necessary.
3. Carrying out approved problem determination and resolution in conjunction with the IBM System/88 Support Center.
4. Providing a data link to the IBM System/88 Support Center.
5. Installing service level updates and fixing as appropriate.
6. Operating the System/88 in a duplexed configuration.
7. Ensuring that the Personal Computer to be used as the system console has been set up prior to System/88 installation.

Problem Determination: Initial problem determination actions will be automatically performed by the System/88. If the System/88 is under a service contract or under warranty, failing CEC components will cause the System/88 to automatically notify the System/88 Support Center. When, as a result of a Customer Problem Analysis and Resolution (CPAR) procedure performed either automatically by the System/88 Support Center and/or on-site by the customer, if the identified failing unit is one of the Customer Replaceable Units (memory, processor, and controller boards), the customer will be informed that IBM will arrange pickup of the failing unit and delivery of a unit in good working order. The customer is responsible for removal of the failing unit, for the installation and verification of the delivered unit.

In all other cases, the customer may call an IBM Customer Engineering service number to request on-site assistance which will be provided at the applicable hourly rates and terms and conditions.

Security, Auditability, and Control: User management is responsible for evaluation, selection, and implementation of security features, for administrative procedures, and for appropriate controls in application systems.

If sensitive data is sent over external communication facilities, user management may wish to consider the application of cryptography.

Configuration: The System/88 and its associated I/O devices provide considerable flexibility and expandability. Contact your IBM Marketing Representative for assistance in developing a configuration that meets your application and performance needs.

System Console Function: An IBM Personal Computer or IBM Personal Computer XT, or their equivalent, must be used as the system console (monitor terminal) for each processor module in a System/88. Refer to the System/88 IBM Personal Computer Terminal Program Product (5732-019) for additional information and prerequisites.

Exchange, rather than repairing in place, is the recommended service philosophy for the Personal Computer to be used as the System Console.

The Personal Computer must be set up by the customer prior to System/88 installation.

SPECIFY

- Power cord: Standard 4.3m (14 ft). For Chicago area customer specify #9986 for 6-foot power cord. All devices within the Processor Cabinet are powered from the Processor Cabinet.
- Power (AC, 1-phase): Specify one of the following:

50 Hz	60 Hz
200V #2806	200V #2732
220V #2813	208V #9902
230V #2821	220V #2803
240V #2801	240V #9914

Each Processor cabinet and 4577 Expansion Cabinet require a separate power connection. The 4576 Processor is designed to operate in an environmental Class B facility and to meet country radiation, safety, and homologation standards. It is only available in Pearl White.

SPECIAL FEATURES

4580 DASD Controller (#1000): (NO LONGER AVAILABLE) This Direct Access Storage Device (DASD) Controller provides system control and management for the 142Mb 4580 Disk Drives. The controller interfaces directly to the 4580 Disk Drives. Each controller supports up to four 4580s and receives power from the S/88 processor. Each controller requires one CEC slot. The 4580 DASD Controllers must be ordered in duplexed pairs. Corequisite: A 4580 Disk Drive. Field Installation: Yes. Maximum: 6 duplexed pairs 4580 DASD Controllers (12 #1000) (NO LONGER AVAILABLE) can be

attached to the 4576, and a maximum of 48 physical 4580s can be spread across the controllers. Minimum: A System/88 processor module must be configured with a minimum of 1 duplexed pair of Disk Drives.

4581 DASD Controller (#1010): (NO LONGER AVAILABLE) This Direct Access Storage Device (DASD) Controller provides system control and management for the 448Mb 4581 Disk Drives. The controller interfaces to the 4581 DASD Director (#1011) which then interfaces to the 4581 Disk Drive. Each 4581 DASD Controller (#1010) (NO LONGER AVAILABLE) supports a maximum of eight 4581 DASD Directors (#1011) and receives its power from the S/88 Processor. Each 4581 DASD Controller (#1010) (NO LONGER AVAILABLE) requires one CEC slot. The 4581 DASD Controller (#1010) (NO LONGER AVAILABLE) must be ordered in duplexed pairs. Corequisite: A 4581 DASD Director (#1011). Field Installation: Yes. Maximum: 6 duplexed 4581 DASD Controller pairs (12 #1010) (NO LONGER AVAILABLE) can be attached to a 4576, and a maximum of 32 physical 4581s can be spread across the controllers. Minimum: A System/88 Processor Module must be configured with a minimum of 1 duplexed pair of Disk Drives.

4580 DASD Controller (#1020): (NO LONGER AVAILABLE) This direct access storage device (DASD) controller provides system control and management for the 142Mb 4580 Disk Drives. The controller interfaces directly to the 4580 Disk Drives. Each controller supports up to four 4580 Disk Drives. Each controller requires one Central Electronic Complex (CEC) slot. The 4580 DASD Controllers must be ordered in duplexed pairs. The corequisite for a controller is a 4580 Disk Drive. Field Installation: Yes. Maximum: 6 duplexed 4580 DASD Controllers can be attached to a 4576 Processor, and a maximum of 23 duplexed 4580 Disk Drives can be spread across the controllers. Minimum: Each System/88 processor module must be configured with at least 1 duplexed pair of disk drives.

4581 DASD Controller (#1030): This direct access storage device (DASD) controller provides system control and management for the 448Mb 4581 Disk Drives. The controller interfaces to the 4581 DASD Director Feature (#1011), which then interfaces to the 4581 Disk Drive. Each 4581 DASD Controller supports a maximum of eight 4581 DASD Directors. Each 4581 DASD Controller requires one CEC slot. The 4581 DASD Controllers must be ordered in duplexed pairs. The corequisite for a 4581 DASD Controller is a 4581 Disk Drive equipped with a DASD Director (#1011). Installed #1011s will operate with the new #1030 Controller without modification. Field Installation: Yes. Maximum: 6 duplexed 4581 DASD Controllers can be attached to a 4576 Processor, and a maximum of 15 duplexed 4581 Disk Drives can be spread across the controllers. Minimum: Each System/88 processing module must be configured with at least 1 duplexed pair of disk drives.

4968 Streaming Tape Controller (#1100): The Streaming Tape Controller provides system management and control for one 4968 Autoload Streaming Magnetic Tape Unit, Model 2AS. The controller cables directly to the 4968 tape drive. This controller is available as a simplex controller only. Each controller requires one CEC slot. Corequisite: A 4968 Autoload Streaming Magnetic Tape Unit, Model 2AS. Field Installation: Yes. Maximum: The System/88 supports a maximum of 4 tape controllers.

4585 Streaming Tape Controller (#1110): The Streaming Tape Controller provides system management and control for one IBM 4585 Autoload Magnetic Tape Unit, Model 001. The controller cables directly to the 4585 tape drive. The controller is available as a simplex controller only. Each controller requires one CEC slot. Corequisite: A 4585 Autoload Magnetic Tape Unit, Model 001. Field Installation: Yes. Maximum: The System/88 supports a maximum of 4 tape controllers.

Communications Controller (#1200): A duplexed pair of Communication Controllers supports a maximum of one Communication Adapter Chassis (#1220) and one Communications Adapter Expansion Chassis (#1230). With these two adapter chassis the duplexed communications controller pair can support up to 16 line adapters. These adapters can support combinations of asynchronous, binary synchronous, X.25, and SDLC lines. Each controller requires one CEC slot. Communications Controllers (#1200) must be ordered in duplexed pairs. Corequisites: Communications Adapter Chassis

(#1220) and at least one line adapter (#1201, #1202, #1203, #1204, #1205, #1206, or #1207). Field Installation: Yes. Maximum: 8 duplexed communications controller pairs (16 #1200) can be installed in a 4576.

Full-Modem Asynchronous Line Adapter (#1201): The Full-Modem Asynchronous Line Adapter provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 9.6K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). Each port on the card provides the signals required for remote communications via a modem (using cable #1801). The adapter uses cable #1801 for attachment to external modem devices. The adapter can also be used in conjunction with a crossover cable (#1816) to provide direct connection of peripheral devices such as terminals and printers. The direct-connect capability can be achieved using either cable #1816 and #1806 for attaching to an IBM Personal Computer or a terminal with a male connector or #1816 plus #1802, #1803, or #1804 for attaching to a terminal with a female connector. Field Installation: Yes.

Direct Connect Asynchronous Line Adapter (#1202): The Direct Connect Asynchronous Line Adapter provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 9.6K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). The adapter can be used with direct connect communication cables (#1802, #1803, #1804) providing for local attachment to terminals and printers with a female connector, or it can be used with the direct connect cable (#1806) for providing local attachment of The IBM Personal Computers. Field Installation: Yes.

Direct Connect Printer Adapter (#1203): The Direct Connect Printer Adapter provides one port for connection of a line printer. The adapter requires one slot in the Communications Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communications Controller (#1200). The adapter is used with direct connect twinaxial cable (#1819, #1820) for providing local attachment of the printer. For distances 15m (50 ft) or less, the Printer Connect Cable #1819 is required. Distances greater than 15m (50 ft) but less than 930m (3,000 ft) require the Printer Connect Cable #1820, 0.3m (1 ft), and a customer-supplied twinaxial extension cable. Field Installation: Yes. Twinaxial Cable Specifications: Refer to GA24-4028 for the 5262 or GA21-9337 for the 4245.

Note: When ordering the 5262 Line Printer for attachment to the System/88, use 5262 specify feature #9102 (Host Designation for System/88).

The System/88 Operating System (Release 2) supports the IBM 5262 Line Printer (Model 1) and the IBM 4245 Line Printer (Model T20) with the following print bands:

5262 Line Printer:

Character Set	Specify	
	A	B
48 International	#2767	#2950
63 International	#9523	#2950
64 International	#2768	#2950
96 International	#2770	#2950

4245 Line Printer:

48 International	#9520	#2950
63 International	#9522	#2950

Remote Support Line/Clock Adapter (#1204): The Remote Support Line/Clock Adapter provides one line port for the Support Modem (#1300) used for remote system support. This adapter also provides a battery-powered system clock that is accessed only during a module power-up. This adapter requires one slot and must be located in the last slot (slot #7) of the first Communication Adapter Chassis (#1220). Connection to the support modem is via a modem cable (cable #1801). Power is supplied to the adapter from the Communication Controller (#1200). One adapter (#1204) is required

per S/88 system. If multiple processor modules are interconnected via the Link Controller (#1400), only one adapter (#1204) is required. If more than one adapter (#1204) exists only one can be active in each S/88 system. Field Installation: Yes.

High-Performance Full-Modem Synchronous Line Adapter (#1205): The High-Performance Full-Modem Synchronous Line Adapter (#1205) provides one RS-232-C or RS-422 line port. The maximum bit rate is 56K bps. The adapter supports bisync, SDLC, and X.25 protocols and requires one slot in a Communication Adapter Chassis (#1220) or Expansion Chassis (#1230). Power for the adapter is supplied via the cables from the Communication Controller (#1200). Modem Cable #1801 is required for modem support. The adapter can also be used in conjunction with the Crossover Cable (#1815) or a customer-supplied RS-422 cable to provide direct connection of synchronous terminal devices. Field Installation: Yes.

High-Performance Direct-Connect Asynchronous Line Adapter (#1206): The High-Performance Direct-Connect Asynchronous Line Adapter (#1206) provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 19.2K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communication Controller (#1200). The adapter can be used with direct connect communication cables (cables #1802, #1803, #1804) providing for local attachment to terminals and printers with a female connector or with the direct-connect cable (#1806) for local attachment of the IBM Personal Computers. Field Installation: Yes.

High-Performance Full-Modem Asynchronous Line Adapter (#1207): The High-Performance Full-Modem Asynchronous Line Adapter (#1207) provides two RS-232-C asynchronous line ports. The maximum bit rate for each port is 19.2K bps. The adapter requires one slot in the Communication Adapter Chassis (#1220) or Expansion Chassis (#1230) and receives power from the Communications Controller (#1200). Each port on the card provides the signals required for remote communications via a modem (using cable #1801). The adapter can also be used in conjunction with the crossover cable (#1816) to provide direct connection of peripheral devices such as terminals and printers. The direct-connect capability can be achieved using either cable #1816 and #1806 for attaching to an IBM Personal Computer or a terminal with a male connector, or #1816 plus #1802, #1803, or #1804 for attaching to a terminal with a female connector. Field Installation: Yes.

Communications Adapter Chassis (#1220): Provides slots for attaching the communication line adapter cards. One chassis connects to a duplexed pair of Communications Controllers (2 #1200). Each chassis supports the attachment of up to 8 line adapter cards, (#1201, #1202, #1203, #1204, #1205, #1206, or #1207). A maximum of 7 of the cards can be high-performance adapter cards (#1203, #1205, #1206, or #1207). Power for Line Adapter Cards is provided by the Communications Controller (#1200) through the chassis. Connectors and fault indicators are provided for each slot in the Communication Adapter Chassis (#1220). Prerequisite: A duplexed pair of Communications Controllers (2 #1200). Field Installation: Yes. Maximum: A total of 4 Communications Adapter Chassis (#1220) and Communications Adapter Expansion Chassis (#1230) can be mounted in the rear rack of a 4576. The total of four can be 4 #1220s or a mix of #1220s and #1230s. A 4577 Expansion Adapter Chassis (#1220) or Communications Adapter Expansion Chassis (#1230).

Communication Line Adapter to Communication Adapter Chassis (#1220) Assignment: Specify Line Adapter feature type and quantity and Communication Adapter Chassis (#1220) sequence as #8XYZ:

where 'X' = the sequence number of the Communication Adapter Chassis (#1220) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet.

where 'Y' = the last digit (1 - 7) of the Communication Line Adapter feature number (#1201 - #1207).

where 'Z' = The quantity of that particular Communication Line Adapter Feature to be installed in this Communication Adapter Chassis (#1220).

A separate specify code is required for each feature type (#1201 - #1207) ordered for installation in this Communication Adapter Chassis (#1220).

For Example: An order that included 2 each - #1201, 1 each - #1202, 1 each - #1203, 2 each - #1205, for installation in the 2nd Communications Adapter Chassis (#1220) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet, would require the following Specify Codes:

#8212 (2 each - #1201)
#8221 (1 each - #1202)
#8231 (1 each - #1203)
#8252 (2 each - #1205)

Communications Adapter Expansion Chassis (#1230): The Communication Adapter Expansion Chassis provides slots for an additional 8 communication Line Adapters, only 7 of which can be high-performance adapters. Power for line adapter cards located in the Communications Expansion Chassis (#1230) is provided by the Communication Controller (#1200) via the Communications Adapter Chassis (#1220). Connectors and fault indicators are provided for each slot in the chassis. Prerequisite: A duplexed pair of Communications Controllers (2 #1200) and a Communications Adapter Chassis (#1220). Field Installation: Yes. Limitations: Only 1 Communications Adapter Expansion Chassis can be connected to a Communications Adapter Chassis (#1220).

Communication Line Adapter to Communication Adapter Expansion Chassis (#1230) Assignment: Specify Line Adapter feature type and quantity and Communication Adapter Expansion Chassis (#1230) sequence as #9XYZ:

where 'X' = the sequence number of the Communication Adapter Expansion Chassis (#1230) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet.

where 'Y' = the last digit (1 - 7) of the Communication Line Adapter feature number (#1201 - #1207).

where 'Z' = the quantity of that particular Communication Line Adapter Feature to be installed in this Communication Adapter Expansion Chassis (#1230).

A separate specify code is required for each feature type (#1201 - #1207) ordered for installation in this Communication Adapter Expansion Chassis (#1230).

For Example: An order that included 2 each - #1201, 1 each - #1202, 1 each - #1203, 2 each - #1205, for installation in the 2nd Communications Adapter Expansion Chassis (#1230) on a 4575 or 4576 Processor or a 4577 Expansion Cabinet, would require the following Specify Codes:

#9212 - (2 each - #1201)
#9221 - (1 each - #1202)
#9231 - (1 each - #1203)
#9252 - (2 each - #1205)

Link Controller (#1400): The Link Controller provides control and management for the local intra-system communication. The controller interfaces directly to the Link Connector (#1410) via the Link Cables #1808, #1809, #1810, or #1811, or customer-supplied cables. The controller provides transmit and receive protocol management for the 1.4Mb serial interface. The controller requires one CEC slot. Link controllers must be ordered as duplex pairs so that a single failure will not prevent inter-processor communication. The continuous aggregate bandwidth of an operational pair of controllers approaches 2.8Mb per second for the duplexed pair.

Only 1 Link Controller pair (2 #1400) is required to attach a processor module to the S/88 Link, hence 1 Link Controller pair (2 #1400) is the maximum that can be configured on a S/88 processor. Field Installation: Yes.

Link Connector (#1410): The Link Connector is a passive device that provides cable connection points for the interconnection of up to six Link Controllers (#1400) on a S/88 Link. Attachment of more than six Link Controllers (#1400) to a S/88 Link requires the interconnection of two or more Link Connectors (#1410) in series. Each additional Link Connector (#1410) attached to the S/88 Link requires a cable connection point on the Link Connector (#1410) it is being at-

tached to, a 4591 Link Extender Model 001 and one of its own cable connection points. All Link hardware components (Controllers, Connectors, Extenders, and Cables) must be ordered in pairs to achieve fault tolerant operation.

A fully configured S/88 System, consisting of 32 Link-connected Processor Modules, requires 32 Link Controller pairs (64 #1400), 8 Link Connector pairs (16 #1410), 7 4591 Link Extender pairs (14 4591 Link Extenders Model 001) and associated cable pairs. The Link Connector can be mounted in the rear rack of a S/88 Processor Cabinet or the front or rear rack of a 4577 Expansion Cabinet. Duplex Link Connectors (#1410) should be installed in adjacent Cabinet positions. The maximum distance between a Link Controller (#1400) and Link Connector (#1410), without the use of the 4591 is 750 feet. Link Connectors (#1410) should be installed in the Processor Modules closest to the physical center of the S/88 Link structure to minimize cabling requirements. Additional processors can be added dynamically to the Link, providing on-line growth to the link structure without impacting function. The 2-foot Link Cable (#1808) is used within the S/88 Processor Cabinet that houses the Link Connector (#1410) for connection between that processor's Controllers (#1400) and Connectors (#1410). The 10-foot Link Cable (#1809) is used if the Link Connector (#1410) is located in a 4577 Expansion Cabinet Model 001 adjacent to a Processor Cabinet. Otherwise the 15m (50 ft) Link Cable (#1810) should be used for greater distances. Prerequisite: A Link Controller (#1400). Field Installation: Yes.

Specify Mounting Location:

#9001 - Under covers installation
#9002 - Wall Mount

2Mb Memory (#1500): (NO LONGER AVAILABLE) The 2Mb Memory feature provides memory control, error detection and correction for 2Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault tolerant system operation. The feature is a two board package, requiring two CEC slots. Power for both boards is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. This feature must always be ordered in duplexed pairs (2 #1500) (NO LONGER AVAILABLE). The 4576 Processor supports a maximum of 64Mb of duplexed memory. Field Installation: Yes.

4Mb Memory (#1510): The 4Mb Memory feature provides memory control, error detection and correction for 4Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault tolerant system operation. The feature is a 3-board package, requiring three CEC slots. Power for all boards is received on the lowest of the three boards, allowing the entire package to be powered from one of the duplexed system power supplies. This feature must always be ordered in duplexed pairs (2 #1510). The 4576 Processor supports a maximum of 64Mb of duplexed memory. Field Installation: Yes.

8Mb Memory (#1530): Provides memory control, error detection and correction for 8Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. The feature is a 2-board package, requiring two CEC slots. Power is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. This feature must always be ordered in duplex pairs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor Models 040 and 060. A maximum of 24Mb is supported if feature #1530 is mixed with feature #1500 (NO LONGER AVAILABLE) or #1510. Maximum: 4 memory features (duplexed) on a 4576 Processor. Field Installation: Yes.

16Mb Memory Feature (#1540): Provides memory control, error detection and correction for 16Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. The feature is a 3-board package, requiring three CEC slots. Power for all boards is received on the lowest of the three boards, allowing the entire package to be powered from one of the duplexed pairs. Limitations: 64Mb duplexed memory on the 4576 Processor Models 040 and 060 feature #1540 may not be intermixed with memory features #1500

MACHINES

(NO LONGER AVAILABLE) or #1510. A maximum of 24Mb is supported if feature #1530 is mixed with feature #1500 (NO LONGER AVAILABLE) or #1510. Maximum: 4 memory features (duplexed) on a 4576 Processor Models 040 and 060. Field Installation: Yes.

8Mb Memory With Controller (#1581) (NO LONGER AVAILABLE): Memory feature #1581 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1581 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 8Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 2-board package, requiring two CEC slots. Power is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor Models 081, 082, 083, or 084. Feature #1581 (NO LONGER AVAILABLE) cannot be used in Model 040, 050, or 060. Feature #1581 (NO LONGER AVAILABLE) cannot be mixed with feature #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, or 084. Field Installation: Yes.

16Mb Memory With Controller (#1582) (NO LONGER AVAILABLE): Memory feature #1582 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1582 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 16Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 2-board package, requiring two CEC slots. Power for all boards is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb duplexed memory maximum on the 4576 Processor Models 081, 082, 083, or 084. Feature #1582 (NO LONGER AVAILABLE) cannot be used with Models 040, 050, or 060. Feature #1582 (NO LONGER AVAILABLE) may not be intermixed with memory features #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, or 084. Field Installation: Yes.

32Mb Memory With Controller (#1583) (NO LONGER AVAILABLE): Memory feature #1583 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1583 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 32Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 3-board package, requiring three CEC slots. Power for all boards is received on the lowest of the three boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb duplexed memory maximum on the 4576 Processor Models 081, 082, 083, or 084. Feature #1583 (NO LONGER AVAILABLE) cannot be used with Models 040, 050, or 060. Feature #1583 may not be intermixed with memory features #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, or 084. Field Installation: Yes.

8Mb Memory with Controller (#1591): Memory feature #1591 is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1591 provides memory control, error detection and correction for 8Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It requires one CEC slot. The board can be replaced dynamically if a permanent failure occurs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor models 081, 082, 083 or 084. Feature #1591 cannot be used in Models 040, 050 or 060, and

it cannot be mixed with feature #1510, #1530, #1540, #1581 (NO LONGER AVAILABLE), #1582 (NO LONGER AVAILABLE), or #1583 (NO LONGER AVAILABLE). Feature #1591 can be mixed with feature #1592 and #1593. The feature must always be ordered in duplex pairs. Maximum: Four pairs of memory features (any combination of #1591, #1592 and #1593), up to a maximum of 64Mb of duplexed memory, occupying up to eight powered central electronic complex (CEC) slots, may be installed on Models 081, 082, 083 and 084. Field Installable: Yes.

16Mb Memory with Controller (#1592): Feature #1592 is provided for ease of ordering. The feature consists of two #1591 8Mb memory features, and requires two CEC slots. A pair of duplexed #1592 features consists of four #1591 features.

32Mb Memory with Controller (#1593): Memory feature #1593 is a 32-bit wide memory which uses 1Mb Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1593 provides memory control, error detection and correction for 32Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It requires one CEC slot. The board can be replaced dynamically if a permanent failure occurs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor models 081, 082, 083 or 084. Feature #1593 cannot be used in Models 040, 050 or 060, and it cannot be mixed with feature #1510, #1530, #1540, #1581 (NO LONGER AVAILABLE), #1582 (NO LONGER AVAILABLE), or #1583 (NO LONGER AVAILABLE). Feature #1593 can be mixed with feature #1591 and #1592. The feature must always be ordered in duplex pairs. Maximum: Four pairs of memory features (any combination of #1591, #1592 and #1593), up to a maximum of 64Mb of duplexed memory, occupying up to eight powered central electronic complex (CEC) slots, may be installed on Models 081, 082, 083 and 084. Field Installable: Yes.

Cable Order: The following cables and connectors are available from IBM for use with the 4576 Processor by ordering the indicated feature numbers. These feature numbers are the only way that cables and connectors can be ordered.

For attachment of Full-Modem Adapter to Modem:

- #1801 Full-Modem Communication Cable 7.5m (25 ft)

For attachment of asynchronous terminals to Direct Connect Adapters:

- #1802 Direct-Connect Asynchronous Communication Cable 15m (50 ft)
- #1803 Direct-Connect Asynchronous Communication Cable 45.5m (150 ft)
- #1804 Direct-Connect Asynchronous Communication Cable 76m (250 ft)
- #1806 Direct-Connect Asynchronous Cable for IBM Personal Computer 7.5m (25 ft)

For inter-processor connection of S/88 processors:

- #1808 Link Cable 0.6m (2 ft)
- #1809 Link Cable 3m (10 ft)
- #1810 Link Cable 15m (50 ft)
- #1811 Link Cable 30.5m (100 ft)

For terminal connections:

- #1814 Remote Terminal to Remote Modem Cable 7.5m (25 ft)
- #1815 Synchronous Crossover Cable 0.3m (1 ft) (eliminates the need for Modems for Synchronous Devices)
- #1816 Asynchronous Crossover Cable 0.3m (1 ft) (eliminates the need for modems for Asynchronous Devices)

For attachment of line printer:

- #1819 Printer to Direct-Connect Printer Adapter Cable 15m (50 ft)
- #1820 Printer to Direct-Connect Printer Adapter Cable 0.3m (1 ft) (for connection to a customer-supplied twinaxial extension cable for distances greater than 15m (50 ft)).

MODEL CONVERSIONS

Model 040 can be upgraded to 4576 Model 060.

Model 050 can be upgraded to the following 4576 models:

- Model 050 to 081
- Model 050 to 082
- Model 050 to 083
- Model 050 to 084

Model 081 through 083 can be upgraded to the following 4576 models:

- Model 081 to 082
- Model 081 to 083
- Model 081 to 084
- Model 082 to 083
- Model 082 to 084
- Model 083 to 084

MACHINES

Model 081, 082, 083, and 084 customers may upgrade installed memory features to 16Mb or 32Mb memory features as follows.

- From #1581* (8Mb) to #1582* (16Mb)
- From #1581* (8Mb) to #1583* (32Mb)
- From #1582* (16Mb) to #1583* (32Mb)

Note: * (NO LONGER AVAILABLE)

Parts removed or replaced become the property of IBM and must be returned.

4576 PROCESSOR MODELS 081, 082, 083, 084 AND MEMORY FEATURES #1591, #1592, AND #1593 - PRODUCT SPECIFICATIONS

DESCRIPTION

The IBM System/88 High-Availability, fault tolerant 4576 Processor now includes Models 081, 082, 083, and 084. The new models incorporate Motorola MC68020 microprocessors, a 32-bit wide data and instruction path, an on-board 16K by 32-bit data and instruction cache, and an on-chip 64 by 32-bit instruction cache. Each microprocessor has an MC68881 co-processor that provides high-performance floating point arithmetic capabilities. Three new 32-bit wide main memory features, which use 256K Dynamic RAM (DRAM) chips, complement the high-performance design of Models 081 through 084.

HIGHLIGHTS

- Duplexed Motorola MC68020 microprocessors
- Fully implemented 32-bit technology
- An on-board 16K by 32-bit cache and an on-chip 64 by 32-bit cache
- MC68881 floating point co-processor for each Motorola MC68020
- Improved price/performance over other System/88 processors
- Source software compatible with other System/88 processors
- Vertical growth path from Model 081 to Model 084
- Three new, 32-bit wide, memory features (8Mb, 16Mb, 32Mb), which use 256K DRAM chips

MODELS

Models 081 through 084: The processor board used in Models 081 through 084 contains one set of duplexed Motorola MC68020 microprocessors, which are enhanced through the use of an on-board 16K by 32-bit data and instruction cache. There is also an on-chip 64 by 32-bit instruction cache. A tightly-coupled Motorola MC68881 co-processor for each MC68020 provides high-performance floating point arithmetic capabilities that supplements the MC68020 instruction set.

Each processor board is duplexed to provide fault tolerant function. Integrated checking and comparator logic on each processor board provides a high level of integrity. As the primary microprocessor on the board is executing instructions, the other microprocessor on the board is executing exactly the same instructions. The results produced by the two microprocessors are continuously compared. If a discrepancy in the results is detected, the entire processor board is taken out of service and the partner board continues to process in a simplex fashion until the defective board is repaired or replaced. The processor board can be replaced dynamically if a permanent failure occurs.

The architecture of Models 081 through 084 provides an expandable family of products. Upgrade of a Model 081, 082, or 083 to the next higher model is accomplished by inserting an additional set of duplexed processor boards into the pre-allocated, pre-wired Central Electronic Complex (CEC) slots in the processor cabinet. This upgrade can be performed dynamically, without 're-booting' the processor module.

Models 081 through 084 use a new 32-bit wide memory which complements their high performance. The new memory uses 256K Dynamic RAM chips and has the ability to transfer up to 64-bits of data in a single cycle. Data is Error Correction Code protected. Single-bit errors are corrected and logged; double-bit errors are

detected. Memory also is duplexed. The memory package can be replaced dynamically if a permanent failure occurs.

Depending upon the mix of features installed, Models 081 through 084 can support 8Mb to 64Mb of duplexed memory, up to 256 communications ports, and up to 6.7Gb of duplexed direct access storage.

Models 081 through 084 are source software compatible with other IBM System/88 processor models and provide an upgrade path for Model 050 customers.

Model Specifics: In mixture of applications, based on internal testing, performance can be the following:

# Physical Boards per Processor Set		# CEC Slots Required for Duplexed Processor Boards		Performance Relative to Model 060	
# Logical Processors					
4576 Model	v	v	v		
050	4	1	2	Up to	0.90
081	1	1	2	Up to	0.75
082	2	2	4	Up to	1.5
083	3	3	6	Up to	2.0
084	4	4	8	Up to	2.5
060	6	3	6		1.0

Additional performance data has been measured running an ET1 benchmark. The new Model 084 provides approximately 3 times the ET1 performance of the Model 060. An ET1 benchmark is one of the measures of performance in the high availability online transaction processing environment. The results reflect performance in a low physical I/O environment and do not necessarily provide information about balanced system performance. The ET1 benchmark consists of Debit/Credit transactions that may not represent any particular Debit/Credit environment. In addition benchmark parameters and implementations vary from test to test. Therefore, the results of this benchmark should be used in conjunction with other inputs to make relative comparisons between different models and/or software releases of the System/88.

Note: Individual customer results may vary. The System/88 model performance for any one customer installation will depend on factors such as the number of users, their specific workload profiles, system capacity, and processor utilization.

SPECIAL FEATURES

Special features currently available for the 4576 Processor Models 040 and 060, except for memory features #1510 (4Mb), #1530 (8Mb), and #1540 (16Mb), are now available for the 4576 Models 081 through 084. The new memory features announced for the Models 081, 082, 083, and 084 are described below.

Memory may be increased on installed Models 081 through 084 by ordering additional memory features or a Memory Upgrade. Increasing memory via a Memory Upgrade results in a savings of CEC slots when compared to adding memory features. For more information, see the section "Model Conversions".

8Mb Memory with Controller (#1581) (NO LONGER AVAILABLE): Memory feature #1581 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1581 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 8Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 2-board package, requiring

two CEC slots. Power is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor Models 081, 082, 083, or 084. Feature #1581 (NO LONGER AVAILABLE) cannot be used in Model 040, 050, or 060. Feature #1581 (NO LONGER AVAILABLE) cannot be mixed with feature #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, and 084. Field Installation: Yes.

16Mb Memory with Controller (#1582) (NO LONGER AVAILABLE): Memory feature #1582 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1582 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 16Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 2-board package, requiring two CEC slots. Power for all boards is received on the lower of the two boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb duplexed memory maximum on the 4576 Processor Models 081, 082, 083, or 084. Feature #1582 (NO LONGER AVAILABLE) cannot be used with Models 040, 050, or 060. Feature #1582 (NO LONGER AVAILABLE) may not be intermixed with memory features #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, or 084. Field Installation: Yes.

32Mb Memory with Controller (#1583) (NO LONGER AVAILABLE): Memory feature #1583 (NO LONGER AVAILABLE) is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1583 (NO LONGER AVAILABLE) provides memory control, error detection and correction for 32Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It is a 3-board package, requiring three CEC slots. Power for all boards is received on the lowest of the three boards, allowing the entire package to be powered from one of the duplexed system power supplies. The package can be replaced dynamically if a permanent failure occurs. This feature must always be ordered in duplex pairs. Limitations: 64Mb duplexed memory maximum on the 4576 Processor Models 081, 082, 083, or 084. Feature #1583 (NO LONGER AVAILABLE) cannot be used with Models 040, 050, or 060. Feature #1583 (NO LONGER AVAILABLE) may not be intermixed with memory features #1510, #1530, or #1540. Maximum: 2 sets of duplexed memory features on 4576 Processor Models 081, 082, 083, or 084. Field Installation: Yes.

8Mb Memory with Controller (#1591): Memory feature #1591 is a 32-bit wide memory which uses 256K Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1591 provides memory control, error detection and correction for 8Mb of system memory. The feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It requires one CEC slot. The board can be replaced dynamically if a permanent failure occurs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor models 081, 082, 083 or 084. Feature #1591 cannot be used in Models 040, 050 or 060, and it cannot be mixed with feature #1510, #1530, #1540, #1581 (NO LONGER AVAILABLE), #1582 (NO LONGER AVAILABLE), or #1583 (NO LONGER AVAILABLE). Feature #1591 can be mixed with feature #1592 and #1593. The feature must always be ordered in duplex pairs. Maximum: Four pairs of memory features (any combination of #1591, #1592 and #1593), up to a maximum of 64Mb of duplexed memory, occupying up to eight powered central electronic complex (CEC) slots, may be installed on Models 081, 082, 083 and 084. Field Installable: Yes.

16Mb Memory with Controller (#1592): Feature #1592 is provided for ease of ordering. The feature consists of two #1591 8Mb memory features, and requires two CEC slots. A pair of duplexed #1592 features consists of four #1591 features.

32Mb Memory with Controller (#1593): Memory feature #1593 is a 32-bit wide memory which uses 1Mb Dynamic RAM (DRAM) technology and has 32/64-bit interleaved access. Feature #1593 provides memory control, error detection and correction for 32Mb of system memory. This feature also provides the system bus level checking and management logic required for the fault-tolerant system operation. It requires one CEC slot. The board can be replaced dynamically if a permanent failure occurs. Limitations: 64Mb maximum duplexed memory on the 4576 Processor models 081, 082, 083 or 084. Feature #1593 cannot be used in Models 040, 050 or 060, and it cannot be mixed with feature #1510, #1530, #1540, #1581 (NO LONGER AVAILABLE), #1582 (NO LONGER AVAILABLE), or #1583 (NO LONGER AVAILABLE). Feature #1593 can be mixed with feature #1591 and #1592. The feature must always be ordered in duplex pairs. Maximum: Four pairs of memory features (any combination of #1591, #1592 and #1593), up to a maximum of 64Mb of duplexed memory, occupying up to eight powered central electronic complex (CEC) slots, may be installed on Models 081, 082, 083 and 084. Field Installable: Yes.

Operating and Power Controls: Power can be turned off with the power on/off switch provided on Operator Control Panel.

Physical Characteristics:

Dimensions:

Front - 600mm (23.5 in.)
Side - 1,029mm (40.5 in.)
Height - 1,360mm (53.375 in.)
Weight - 272kg (max.) (600 lbs. (max.))

Heat Output: 11,000 BTU/Hour

Power Requirements:

4 KVA (50 Hz and 60 Hz) (max.)
3-phase (50 Hz and 60 Hz)

Usability Characteristics: The Operator Control Panel on 4576 Models 081 through 084 provides the interface to system control functions such as starting and stopping the module, booting the module and module status indicator lights. The Control Panel also contains a 16-character LCD display which provides module level status and error conditions.

Specified Operating Environment: The IBM System/88 and related software comprise a mid-range fault-tolerant systems offering which is applicable in many online application environments where customers require high availability or continuous operations capability. Application software is currently available from non-IBM sources for many applications, including automatic teller machine/point-of-sale switching, cash management, bank teller, and warehouse inventory tracking. See "IBM System/88 Software Solutions Catalog", GA34-0801, for details.

Model 081 through 083 provides a vertical growth path for IBM System/88 users. Model 081 through 083 can be upgraded by inserting an additional pair of processors into predetermined slots in the Central Electronic Complex (CEC).

Limitations: Of the 40 Central Electronic Complex (CEC) slots in the 4576 Processor chassis, up to 36 slots may be used on Model 081 through 084 for processor, memory, and controller boards. For example:

- An 8Mb Model 081 will use 4 CEC slots for duplexed memory and 2 CEC slots for one set of duplexed processor boards. 6 more CEC slots are allocated and pre-wired for processor additions to allow upgrading to a Model 082, 083, or 084 when desired. Up to 24 CEC slots remain available for DASD, communications, tape, and link controllers, and for additional memory. In this configuration, the 4 remaining slots (of the total of 40 in the chassis) have no power connection and will remain unoccupied.
- A 64Mb Model 084 will use 12 CEC slots for duplexed memory and 8 CEC slots for 4 sets of duplexed processor boards. Up to 16 CEC slots remain available for DASD, communications, tape, and link controllers. In this configuration, the 4 remain-

ing slots (of the total of 40 in the chassis) have no power connection and will remain unoccupied.

Programming requirements: Release 3 of the IBM System/88 Operating System is required.

4577 EXPANSION CABINET

PURPOSE

The 4577 Expansion Cabinet for the System/88 provides dual A.C. power distribution and a standard 19-inch rack chassis for rack mountable units, such as 4580 and 4581 Disk Drives, 4968 and 4585 Tape Drives, Communication Adapter Chassis (#1220) and Expansion Chassis (#1230). Link Connectors (#1410) may also be mounted in a 4577 Expansion Cabinet if necessary. The 4577 attaches via its Air Plenum to the 4575 Processor, the 4576 Processor, or another 4577 Expansion Cabinet. Power sequencing for the 4577 is via the power control provided in the 4575 or 4576 Processor. Multiple 4577s can be connected to a 4575 or 4576 Processor.

MODELS

Model 1 001

HIGHLIGHTS

Prerequisites: 4575 Processor or 4576 Processor.

Publications: "Site Planning Guide", SA34-0302

Cable Orders: All cables and connectors required to attach the 4577 to the System/88 are supplied with the shipment of the 4577.

SPECIFY

- Power Cord: Standard 4.3m (14 ft.). For Chicago area customer specify #9986 for a 6 ft. power cord. All devices within

a 4577 Expansion Cabinet are powered from the 4577 Expansion Cabinet and must be ordered with the same voltage as the 4577.

- Power (AC, 1-phase): Specify one of the following:

50 Hz		60 Hz	
200V	#2806	120V	#9911
220V	#2813	200V	#2732
230V	#2821	208V	#9902
240V	#2801	220V	#2803
		240V	#9914

SPECIAL FEATURES

Where Communications Adapter Chassis (#1220) and Communications Adapter Expansion Chassis (#1230) are located within the 4577, the same Communication Line Adapter to Communication Adapter Chassis Assignment for the 4575 or 4576 will apply.

4580 DISK DRIVE

PURPOSE

The 4580 is a 142MB direct access storage device for the System/88 that is rack mounted directly in a 4575 or 4577 cabinet. Two 4580s can be mounted in the 4575 Processor Cabinet and up to six can be mounted in a single 4577 Expansion Cabinet. The 4580 is designed to operate in parallel with a partner 4580. Any unrecoverable errors on the 4580 causes the unit to be automatically taken out of service and processing continues with the disk's partner device without interrupting system operations. 4580 assemblies can be replaced without interrupting System/88 operations.

When a replaced 4580 assembly is brought back into service, system management routines automatically bring the unit up to date to a point where it is an exact image of its partner. The data transfer rate for the 4580 is 1.04 MB/sec.

- | A maximum of 16 duplexed 4580s can be attached to a 4575. A 4576
- | can attach a maximum of 24 duplexed 4580s.

MODELS

Model 1 001

Prerequisites:

- | ● 4575 Processor or a 4576 Processor with a 4577 Expansion cabinet
- Disk Controller Feature #1020

Maximum: A maximum of four 4580s can be attached to each 4580 DASD Controller Feature (#1020).

HIGHLIGHTS

- Formatted with 2048 byte fixed length sectors to optimize the speed of data handling.
- Rack Mountable - two units can be mounted in a 4575 processing module cabinet and up to six can be mounted in a 4577 expansion cabinet.
- Hot Plugability - duplexed drives can be taken off-line, serviced, replaced, added without impacting system operations.
- Self contained maintenance routines continually monitor units for operational errors.
- Architected for mirrored operations with a partner 4580.

Publications: System and Operating System:

- "Introduction to the Operating System" SC34-0664
- "OS Reference" SC34-0665
- "Site Planning Guide" SA34-0302
- "OS Commands" SC34-0666
- "User's Maintenance Guide" SY34-0356

Technical Specifications:

Cylinders	1121
Tracks per Cylinder	7
Sectors per Cylinder	62
Bytes per Sector	2048
Data transfer rate	1.04 MB/sec
Average Seek Time	40 ms
Average Rotational Delay	9.7 ms
Average Access Time	49.7 ms

Cable Orders: All cables and connectors required to attach the 4580 to the System/88 are supplied with the shipment of the 4580. Power for the 4580 is supplied from the Processor Cabinet or 4577 Expansion Cabinet that houses the 4580.

SPECIFY

- Power (AC, 1-phase): The voltage specified must be the same as the voltage of the 4575 or the 4577 in which the 4580 will be located. Specify one of the following:

50 Hz	60 Hz
200V #2806	120V #9911
220V #2813	200V #2732
230V #2821	208V #9902
240V #2801	220V #2803
	240V #9914

Disk Drive to DASD Controller Assignment Specify.

- For each 4580 ordered, specify one: #9XXY

where XX = sequence number of DASD Controller (#1020) on a 4575 or 4576 processor. ("XX" can be a number with range of 01 to 08 for DASD Controller sequences on a 4575, and "XX" can range from 01 to 12 for DASD Controller sequences on a 4576 Processor.)

and where Y = sequence number of this 4580 attached to its DASD Controller (#1020) that was identified as "XX" above. "Y" can range from 1 to 4.

For Example: A 4580 that will be connected to the fourth DASD Controller (#1020) on a 4575 or 4576 Processor and that will be the second 4580 attached to this fourth controller, will have a specify code of #9042.

4581 DISK DRIVE

PURPOSE

The 4581 is a 448MB direct access storage device for the System/88 that is rack mounted directly in the 4577 Expansion Cabinet Model 1. The 4581 is designed to operate in parallel with a second partner 4581. Any unrecoverable errors on the 4581 causes the unit to be automatically taken out of service and processing continues with the disk's partner device without interrupting system operation. 4581 assemblies can be replaced without interrupting System/88 operations. When a replaced 4581 assembly is brought back into service, system management routines automatically bring the unit up to date to a point where it is an exact image of its partner. The data transfer rate for the 4581 is 1.8 MB/sec.

A maximum of 16 duplexed 4581s can be attached to each 4575 Processor and a maximum of 15 duplexed 4581s can be attached to a 4576 Processor. A maximum of four (4) 4581s and associated 4581 DASD Directors (#1011) can be installed in one 4577 Expansion Cabinet mdl 1.

MODELS

(Canada only > Model 1 001 <)

Model 2 002

Prerequisites: Hardware Requirements:

- The 4581 requires a 4581 DASD Director Feature (#1011) for each 4581 configured and a 4575 or 4576 Processor with the 4581 DASD Controller Feature (#1030) installed, and an attached 4577 Expansion Cabinet model 1.

Maximum: A maximum of eight 4581s can be attached to each 4581 DASD Controller (#1030).

HIGHLIGHTS

- Formatted with 2048 byte fixed length sectors to optimize the speed of data handling.
- Hot Plugability - duplexed drives can be taken off-line, serviced, replaced, or added without impacting system operation.
- Self contained maintenance routines continually monitor units for operational errors.
- Architected for mirrored operations with a partner 4581.

Technical Specifications:

Cylinders	842
Tracks per Cylinder	20
Sectors per Cylinder	260
Bytes per Sector	2048
Data transfer rate	1.8 MB/sec
Average Seek Time	18 ms
Average Rotational Delay	7.5 ms
Average Access Time	25.5 ms

Publications: System and Operating System:

- SC34-0664 "Introduction to the Operating System"

- SC34-0665 "OS Reference"
- SA34-0302 "Site Planning Guide"
- SC34-0666 "OS Commands"
- SY34-0356 "User's Maintenance Guide"

Cable Order: All cables and connectors required to attach the 4581 to the System/88 are supplied with the shipment of the 4581. Power for the 4581 is provided from the 4577 Expansion Cabinet that houses the 4581.

SPECIFY

- Power (AC, 1-phase): The voltage specified for the 4581 must be the same as the voltage for the 4577 in which it will be located. Specify one of the following:

50 Hz	60 Hz
200V #2806	120V #9911
220V #2813	200V #2732
230V #2821	208V #9902
240V #2801	220V #2803
	240V #9914

Disk Drive to DASD Controller Assignment Specify.

- For each 4581 ordered, specify one: #9XXY

where XX = sequence number of DASD Controller (#1030) on a 4575 or 4576 Processor. ("XX" can be a number with range of 01 to 06 for DASD Controller sequences on a 4575, and "XX" can range from 01 to 12 for DASD Controller sequences on a 4576 Processor.)

and where Y = sequence number of this 4581 attached to its DASD Controller (#1030) that was identified as "XX" above. "Y" can range from 1 to 8.

For example: A 4581 that will be connected to the fourth DASD Controller (#1030) on a 4575 or 4576 Processor and that will be the second 4581 attached to this fourth controller, will have a specify code of #9042.

SPECIAL FEATURES

The 4581 Direct Access Storage Device (DASD) Director (#1011): Provides interface control between the 4581 DASD Controller (#1030) and the 448MB 4581s. Each 4581 DASD Director supports one 4581. The 4581 DASD Director requires rear rack space in the 4577 Expansion Cabinet model 1 and must be mounted directly behind its associated 4581. Prerequisite: The 4581 DASD Controller #1030. Maximum: A maximum of eight 4581 DASD Directors can be attached to a 4581 DASD Controller (#1030).

ACCESSORIES (NONE)

SUPPLIES (NONE)

4585 AUTOLOAD STREAMING MAGNETIC TAPE UNIT

PURPOSE

The 4585 Autoload Streaming Magnetic Tape Unit provides fast, convenient save/restore capabilities to System/88s having medium to large disk capacities as well as magnetic tape processing capabilities. The 4585 tape formats are ANSI compatible 1600 bpi PE, ANSI compatible 6250 bpi GCR, and 3200 bpi PE. The 4585 Streaming Tape Controller (#1110) is the 4585 attachment board, which mounts in the System/88 Central Electronic Complex (4575 or 4576) processor cabinet.

MODELS

Model 1 001

Limitations: There are no special features.

Maximum: A maximum of four per System/88 processing module may be installed.

Prerequisites: A 4575 processor and a 4577 Expansion Cabinet or a 4576 processor and a 4577 Expansion Cabinet are required as a prerequisite. The 4585 and 4585 Streaming Tape Controller (#1110) are co-requisite. Refer to the M4575 or 4576 pages.

Customer Setup (CSU): Is not a customer setup machine.

HIGHLIGHTS

- The 4585 has streaming capability for save/restore, and through an internal cache, offers response time typical of start/stop devices.
- Up to four 4585 model 001s and four tape controllers per System/88 processing module.
- Tape formats are: 6250 bpi GCR, 3200 bpi PE, 1600 bpi PE
- The 4585 is compatible with IBM 3420 tape drives and IBM 4968 tape units.
- The key parameters of save/restore are speed, capacity and convenience. The 4585 has these attributes:
 - Speed: When reading or writing to tape, the 4585 tape speed is 100 ips in 1600 bpi mode, 70 ips in 6250 bpi mode, and 50 ips in 3200 bpi mode. These speeds apply to both streaming save/restore and start/stop processing modes.
 - Capacity: Each 2,400 foot tape reel has an unformatted capacity of approximately 40MB in 1600 bpi mode, 80MB in 3200 bpi mode, and 170MB in 6250 bpi mode.
 - Convenience: Autoload eliminates tape threading by the operator. Autoload plus large per reel capacity make operator convenience a key 4585 highlight. The autoload mechanism features self-seating, self-locking tape hub and tape reel upside-down detect.

DESCRIPTION

The 4585 Autoload Streaming Magnetic Tape Unit offers both start/stop processing and streaming tape save/restore. Tape for-

ms are ANSI compatible 1600 bpi PE and 6250 bpi GCR. The 4585 also writes 3200 bpi PE.

The 4585 Streaming Tape Controller (#1110) provides system management and control for one 4585. The controller cables directly to the 4585 tape drive. The controller is available as a simplex controller only. The controller receives power directly from the System/88 processor module. Each controller mounts in the processor and requires one Central Electronic Complex (CEC) slot. Co-requisite for a controller is a 4585 model 001.

The 4585 and the 4968 Autoload Streaming Magnetic Tape Unit, attached to their respective controllers, may coexist on any System/88 processing module in any mixture not exceeding a total of four tape units.

Publications: The following publications are shipped with the product.

- "IBM System/88, 4585 Tape Unit Guide" (SX34-1001)
- "IBM System/88, 4585 Autoload Streaming Magnetic Tape Unit Maintenance Manual" (SY34-0500)

SPECIFY

Electrical power for the 4585 is provided by the 4577 Expansion Cabinet. The 4585 voltage specified must match the voltage of the 4577 it is mounted in. Electrical power for the 4585 Streaming Tape Controller (#1110) is provided by the 4575 Processor or the 4576 Processor.

- Voltage (AC, 1-phase):

50 Hz		60 Hz	
200V	#2806	120V	#9911
220V	#2813	200V	#2732
230V	#2821	208V	#9902
240V	#2801	220V	#2803
		240V	#9914

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES

Two tape reels will be shipped with the 4585. One tape is for maintenance and diagnostic use by the IBM service representative. The second tape is for customer use. Tape reel sizes used with the 4585 are 7, 8.5, and 10.5 inches in diameter. Only IBM Multi System Tapes (P/N 6842028) or equivalent tapes certified for 6250 bpi should be used.

A tape cleaning kit (P/N 352465) is shipped with the tape unit.

4591 LINK EXTENDER

PURPOSE

The 4591 is an active device (signal booster) that can be used to extend the distance limitation between Link connected System/88 processor modules or can be used to increase the total number of processors that can be interconnected through the use of Link Connectors (#1410). The 4591 Link Extender allows an additional 1500 feet of Link cable between it and a 4575 Processor, a 4576 Processor, or another 4591 Link Extender. Multiple 4591s may be connected in series to achieve greater distances. System/88 configurations requiring the interconnection of more than six (6) Processor Modules will need two or more Link Connectors (#1410) that must use Link Extenders between them. For duplexed Link operations, a second 4591 is required at each 4591 location. The cable length from a Link Connector to a 4591 must not exceed 750 feet. The Link Extender must not be mounted inside the 4575 or 4576 Processor Cabinet or the 4577 Expansion Cabinet.

MODELS

Model 1 001

Prerequisites:

- Multiple 4575 or 4576 Processors
- Link Connector Feature #1410.

Publications: System and Operating System:

- SC34-0664 "Introduction to the Operating System"
- SC34-0665 "OS Reference"
- SA34-0302 "Site Planning Guide"

- SC34-0666 "OS Commands"
- SC34-0667 "System Administrator's Guide"
- SY34-0356 "User's Maintenance Guide"
- SC34-0694 "The Analyze System Performance Guide"

Cable Order: Cables for use with the 4591 are ordered as features of the 4575 or 4576 Processor. These feature numbers are the only way that cables and connectors can be ordered.

SPECIFY

- Power (AC, 1-phase): Specify one of the following:

50/60 Hz	
120V	#9911
220V	#2803

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

4683 POINT OF SALE TERMINAL

PURPOSE

The 4683 is a user-programmable terminal for the 4680 Store System. It provides, under application program control, the ability to process point of sale transactions, data collection, credit authorization, price look-up and other inquiry and data entry functions. The 4683 Model 1 and Model 2 (when attached to the Model 1) can continue most sales functions under application program control when disconnected from the 5170 Personal Computer AT/Store Controller.

MODELS

Two models of the 4683 Point of Sale Terminals are supported under the 4680 Store System.

Model 1 001: Comprised of a base unit with 1,024K bytes of base storage, a microprocessor, and cable receptacles that will allow the basic point of sale input and output units to be cable-attached. The base also has two slots that allow feature expansion options to be added that increases the number of input and output devices that can be attached. The 4683 Model 1 terminal communicates with the 5170 Personal Computer AT/Store Controller via a high-speed store loop at 38.4K bps.

Model 2 002: Comprised of a base unit with the same input and output attachment capability of the 4683 Model 1. The 4683 Model 2 terminal must be cable attached to the 4683 Model 1 and is dependent on the 4683 Model 1 terminal for processing and storage.

Note: The 4683 Model 2 terminal may also be attached directly to an IBM Personal Computer, IBM Personal Computer XT, IBM Personal Computer AT, and IBM Personal System/2 Model 30 when the IBM 4683 Attachment Adapter Kit is installed in one of the above system units.

See limitations #2 (below) for the 4683 Model 2 when attached to the 4683 Attachment Adapter Kit.

Limitations #1: The following limitations apply when the 4683 Models 1, A01 and 2 are installed for use with the 5170 Personal Computer AT/Store Controller.

1. Only one 4683 Model 2 terminal can be attached to a 4683 Model 1 terminal.
2. The 4683 Model 2 can be attached up to 150m (500 ft) from the Model 1.
3. Only two Feature Expansion options may be set-up on a 4683 Model 1 or 2.
4. Up to 64 4683 Model 1 terminals may be attached by store loop wiring to an 5170 Store Controller.
5. Loop cable distances are allowed up to 1,220m (4,000 ft) between 4683 Model 1 terminals that are powered on.
6. The devices that can be attached to the terminals are:

Maximum Attachments

	Base Unit Attachments	Maximum Unit	See Note
#3320	50-Key Modifiable Keyboard	1	
#3322	Alphanumeric Keyboard	1	
#3339	Shopper Display	1	2
#4010	Magnetic Stripe Rdr	1	1
#3343	40-Character		

	Alphanumeric Display	2	2
#3340	Operator Display	2	2
#3360	Cash Drawer with Fixed Till	1	3
#3361	Cash Drawer with Adjustable Till	1	3
#3380	Printer	1	
3687-002	3687 Scanner Model 002	1	
1520	Hand Held Scanner Model A02 1520-A02	1	
#4000	Feature Expansion A	1	4
#4001	Feature Expansion B	2	4
#4002	Feature Expansion C	2	4
#4003	Feature Expansion D	2	4

Extended Attachments

- 127mm (5 inch) Monochrome Display*
 - Feature Expansion Option A (#4000): 2 (2)
- 300mm (12 inch) Monochrome Display #3354
 - Feature Expansion Option A (#4000): 2 (2)
- 346 (14 inch) Color Display #3352
 - Feature Expansion A (#4000): 2 (2)
- Non-IBM OCR Hand-Held Reader Cable #4024
 - Feature Expansion Option B (#4001): 1
 - Feature Expansion Option C (#4002): 1
 - Feature Expansion Option D (#4003): 1
- Non-IBM Scale Cable #4026 (5)
 - Feature Expansion Option B (#4001): 1
 - Feature Expansion Option C (#4002): 1
- Non-IBM Coin Dispenser Cable #4028 (5)
 - Feature Expansion Option B (#4001): 1
 - Feature Expansion Option C (#4002): 1
 - Feature Expansion Option D (#4003): 1
- Asynchronous Comm. Cable - RS-232-C (#4020)
 - Feature Expansion Option C (#4002): 1
 - Feature Expansion Option D (#4003): 1
- Asynchronous Comm. Cable - RS-232-C or Current Loop (#4022)
 - Feature Expansion Option C (#4002): 1
 - Feature Expansion Option D (#4003): 1
- Magnetic Wand Reader (#4016)
 - Feature Expansion Option D (#4003): 1

* See "Accessories" section.

Notes:

1. Magnetic Stripe Reader #4010 attaches to the 50-Key Modifiable Keyboard (#3320).
2. A maximum of four displays may be attached to a 4683 with the following restrictions and combinations of video and non-video displays.
 - A maximum of two video displays may be attached to a 4683 in any combination. The video displays include the 346mm (14 inch) Color Display and the previously announced 127mm (5 inch) and 300mm (12 inch) monochrome displays. Note that Feature Expansion A (#4000) is required for each video display attached.
 - A maximum of two non-video type displays can be attached to a 4683 in any combination. The non-video displays include the Shopper Display and the previously announced 40-Character Alphanumeric Display and the Operator Display.

The above combinations have the following restrictions:

- A maximum of one Shopper Display may be attached. The Shopper Display is designed as a second display, therefore, one of the other non-video or video displays must be used as the system interface to the operator.

- Combinations of the 40-Character Alphanumeric Display and the 127mm (5 inch) monochrome display is limited to three, and a fourth display cannot be attached.
- 3. A maximum of 2 cash drawers may be attached in any combination of features #3360 and #3361.
- 4. Any combination of Feature Expansion options is allowable except Feature Expansion D (#4003) which is limited to one per 4683 Model 1 or 2.
- 5. The Non-IBM OCR Hand Held Reader Cable (#4024) and Non-IBM Scale Cable are mutually exclusive on the same Feature Expansion Option.

Limitations #2: The following limitations apply when the 4683 Model 2 is attached to the 4683 Attachment Adapter Kit installed in the system unit of an IBM Personal Computer, IBM Personal Computer XT, IBM Personal Computer AT, and IBM Personal System/2 Model 30.

- 1. Only two 4684 Model 2 terminals can be attached to the 4683 Attachment Adapter Kit.
- 2. The 4683 Model 2 can be attached up to 122m (400 ft.) from the 4683 Attachment Adapter Kit installed in the System Unit.
- 3. The devices that can be installed on a 4683 Model 2 when attached to the 4683 Attachment Adapter Kit are:

Base Unit Attachment	Feature Code	Maximum Unit	Note
50 Key Modifiable Keyboard	#3320	1	
Magnetic Stripe Reader	#4010	1	1
40 Character Alphanumeric Display	#3343	2	
Cash Drawer with Fixed Till	#3360	2	2
Cash Drawer with Adjustable Till	#3361	2	2
Printer	#3380	1	
1520 Hand Held Scanner	1520-A02	1	

Note 1: The Magnetic Stripe Reader (#4010) attaches to the 50-Key Modifiable Keyboard (#3320).

Note 2: A Maximum of 2 cash drawers may be attached in any combination of features #3360 and #3361.

Warranty Period: 3 months.

Warranty Service: Warranty service is a Customer Carry-In Exchange (CCE) and is provided under the Agreement for Purchase of IBM Machines WWWWW.

Warranty Option: IBM On-Site Exchange (Specify #9799) and Customer On-Site Exchange (Specify #9826) are available for the applicable Warranty Option Charge under the IBM Maintenance Agreement.

Prerequisites:

- 1. A 5170 Personal Computer AT/Store Controller provides the control function for the 4683 Model 1 terminal.
- 2. A 50-Key Modifiable Keyboard or Alphanumeric Keyboard and either an Operator Display, a 40-Character Alphanumeric Display, a 127mm (5 inch) Monochrome Display, a 300mm (12 inch) Monochrome Display, or or a 346 (14 inch) Color Display are required on the 4683 Models 1 and 2.

- 3. A base unit cable, either #4030, #4032 or #4034, is required with the 4683 Model 2.

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement Letter must include the following statement:

"It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 4683 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations."

Customer Setup: The 4683 will be shipped with customer setup instructions. The customer is responsible for:

- 1. Unpacking, placement, setup and checkout of the 4683 at the time of delivery or when relocating the 4683.
- 2. Relocation of the 4683 (if required) to allow IBM service access.
- 3. Using and following the 4683 Problem Determination Procedures.

HIGHLIGHTS

- The 4683 is a user-programmable point of sale terminal for use with the 4680 Store System. Under application program control, the terminal provides the ability to process point of sale transactions, collect data, authorize credit, look up prices, and process other inquiry and data entry functions. The 4683 Model 1 and Model 2 (when attached to the 4683 Model 1) can continue many sales functions, under application program control, when disconnected from the 5170 Personal Computer AT/Store Controller.
- The Model 1 includes a base unit with 1,024K bytes of storage, a microprocessor, and cable receptacles that allow attachment of basic point of sale input and output devices. In addition, the base unit contains two slots for the installation of feature expansion options to which additional input/output devices can be attached. The 4683 Model 1 communicates with the 5170 Store Controller via a high-speed store loop at 38.4K bps.
- The Model 2 includes a base unit and has the same input/output attachment capability as the Model 1. The Model 2 must be cable attached to the Model 1 and is dependent on the Model 1 for processing and storage. The 4683 Model 2 can be attached to an IBM Personal Computer, IBM Personal Computer XT, IBM Personal Computer AT, and IBM Personal System/2 Model 30.
- The Model 1 base control unit contains a customer replaceable, rechargeable battery and a charger that maintain the 1,024K bytes of storage for up to 15 minutes if the power source is interrupted. The data and programs retained will allow transaction restart if power is returned during the battery retention period. In addition, data and programs are maintained through a power supply trickle charge feature. This feature will power storage, independent of the terminal on/off switch position, as long as the 4683 is plugged into a powered wall receptacle.
- Both models include 2,048 bytes of storage with long-term storage retention by a long-life battery. The 2,048 bytes of storage is used to store vital terminal and customer data including totals. 1,024 bytes of this storage is reserved for customer application use.
- The basic point of sale I/O units that can be attached to the base control unit of both models include a keyboard, cash drawers, printer, and displays. These units can be attached in either an integrated or distributed configuration. The base unit of both models also allows the attachment of a 3687 Checkout Scanner Model 2 and a 1520 Hand-Held Scanner Model A02. A magnetic stripe reader may be mounted on and attached to the keyboard.
- Additional I/O devices can be attached to both models by the customer setup feature expansion options. These devices in-

clude a 127mm (5 inch) Monochrome Display, a 300mm (12 inch) Monochrome Display, or a 346 (14 inch) Color Display, a magnetic wand reader, a non-IBM scale, coin dispenser, cash drawer or external alarm, and a non-IBM OCR hand-held reader or a 1520 Hand-Held Scanner Model A01. Other devices can be attached through an Asynchronous Communication Interface - RS-232-C depending on the feature expansion options used.

Customer Responsibilities:

1. The customer must provide (purchase, install, and maintain) all the necessary 4680 loop wiring lines and data connectors within the store for the 1) loop, and 2) the connection of a 4683 Model 1 to a 4683 Model 2 if the cable distances exceed 20m (66 ft). Refer to the following publications for detail wiring information.
 - "IBM 4680 Store System: Preparing Your Site", GA27-3692
 - "IBM Cabling System Planning and Installation Guide", GA27-3361
 - "IBM Cabling System Catalog", G570-2040
 - "IBM 4680 Store System: Selecting Hardware and Software Components" GA27-3691
 - "Using the IBM Cabling System with Communication Products", GA27-3620
2. The customer is responsible for using the IBM-provided Problem Determination Procedures for identifying a failing unit.
3. The encoding of the magnetic stripe on credit cards and employee badges contains data-integrity formats and check characters. This does not imply, however, that they are not subject to fraud techniques. Implementing of any additional data security is the responsibility of the customer.
4. The customer is responsible for obtaining and maintaining any non-IBM required devices or furniture needed to complete a checkout environment beyond those elements supplied by IBM.
5. A keytop extractor is shipped with each keyboard to aid in the removal of keytops if required.
6. Due to the flexibility of this system, program and data security are the responsibility of the customer.
7. The customer will be responsible for setup and removal of all cables.

Environment: The 4680 Store System is designed for store environments where heating and cooling facilities are provided as required by geographical location. See "IBM 4680 Store System - Preparing Your Site", GA27-3692 for detailed information on environmental criteria for the 4683 and the 5170 Personal Computer/AT Store Controller.

Maintenance: 4683 terminals located in the immediate sales area may preclude online service due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the failing terminal to a service facility located within the store. At this location the customer can determine the failing element and test the terminal online through a customer-provided store loop receptacle.

Publications: The following publications are available for the 4680 Store System and the IBM Cabling System:

- "IBM 4680 Store System: Planning Guide", GC30-3362
- "IBM 4680 Store System: Selecting Hardware and Software Components", GA27-3691
- "IBM 4680 Store System: Preparing your Site", GA27-3692
- "IBM Cabling System Planning and Installation Guide", GA27-3361
- "IBM Cabling System Catalog", G570-2040
- "Using the IBM Cabling System with Communication Products", GA27-3620

- "A Building Planning Guide for Communication Wiring", G320-8059

Note: For customers with installed 4680 Systems, the revised version of the "IBM 4680 Store System: Messages, Symptoms, and Problem Resolution Guide" (SC30-3358-2) may be ordered as of September 25, 1987. The revised version is applicable to Release 1, 2 and 3 of the IBM 4680 Operating System.

Bibliography: GC20-0370

Ordering Information: Orders for any quantity may be taken by a Marketing Representative and will be processed on AAS by the branch office.

SPECIFY

- (Canada only > Voltage (120V AC, 1-phase, 3-wire, 60 Hz): For each 4683 specify one of the following power cords:
 - #9512, 4.3m (14 ft) with locking plug, P/N 7842130
 - #9510, 4.3m (14 ft) with non-locking plug, P/N 6952296 <)

- Voltage (AC, 1-phase):

50 and 60 Hz

Low-Voltage 100-127V AC #2900; High-Voltage 200-240V AC #2901

Note: A power cord and plug will be shipped with each 4683 base unit and 300mm (12 inch) Monochrome Display. The country code will be used to select power, language and nomenclature. Only countries that wish to order other than their own must use a specify code.

Note: 100-127V AC, 60 Hz is compatible with existing 115V systems.

- Machine Nomenclature:

Canadian English #2934
Canadian French #2935
English US #2950
Spanish #2931

- Lock Inserts: Specify one of the following lock inserts for each Printer (#3380), Cash Drawer (#3360 or #3361) or 50-Key Modifiable Keyboard (#3320) ordered. Each of the above devices is shipped with a lock insert housing installed. A lock insert or a non-operating lock insert must be specified. These lock inserts are installed during customer setup using a master lock insert key which is shipped with each 5170 PC AT/Store Controller. The master lock insert key is also used to remove and replace lock inserts after the initial customer setup. Customers should retain the master lock insert key for future use.

Specify #9201 for a Lock Insert that will randomly be selected when a designated lock combination is not required. Two keys will be shipped with each lock insert.

Specify Codes #9202 through #9221 are specific lock inserts and must be ordered when designated lock combination is required. Two keys will be shipped with each lock insert.

#9202	#9206	#9210	#9214	#9218
#9203	#9207	#9211	#9215	#9219
#9204	#9208	#9212	#9216	#9220
#9205	#9209	#9213	#9217	#9221

Specify #9223 for a non-operating lock insert if a key operated lock is not required.

Note: Lock inserts are not covered under the IBM Maintenance Agreements. See "Accessories" section for replacement part ordering instruction.

SPECIAL FEATURES

Unless otherwise excluded, all special features apply to both the 4683 Model 1 and Model 2.

50-Key Modifiable Keyboard (#3320): Provides a keyboard that can be arranged in a variety of key layouts using customer-legendable keys. The keyboard is shipped with single keybuttons installed but without the lens (key tops) installed.

Keyboard legend sheets in several colors with common legends will be shipped with the 4683 Model 1 and Model 2 base units. Refer to "IBM 4680 Store System: Selecting Hardware and Software Components" (GA27-3691), for detail of the legend sheet nomenclature.

All single function keys are under user-program control. Vertical double keys can be created by using a double key lens. The standard height keybuttons may be replaced with raised keybuttons. If fewer keys are desired, the keybuttons of any vertical row of 5 function keys can be removed and a shield installed to cover the unused keys. The keyboard can be used in an integrated or distributed configuration. The keyboard includes:

- 2 system function keys with legends
- 11 engraved numeric keys in a keypad arrangement
- 37 single function keys
- 1 key-button removal device
- 1 ship group that includes:
 - 45 standard height single lens
 - 12 raised single lens
 - 10 standard height double lens
 - 4 raised double lens
 - 3 standard keybuttons
 - 18 raised keybuttons
 - 2 key shield
 - 1 engraved * keybutton

The keyboard includes a managers override keylock (see "Specify" section for lock insert ordering instructions). Prerequisite: Either the Integrated (#3325) or Distributed (#3326) Keyboard Attachment Cable. Limitation: Mutually exclusive with Alphanumeric Keyboard (#3322). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Note: See "Accessories" for additional keybuttons, lens, and legend sheets.

Alphanumeric Keyboard (#3322): Provides an 84-key alphanumeric keyboard that includes alphanumeric keys, a numeric keypad in an adding machine arrangement, 16 function keys, an audible alarm and a managers override keylock. The function keys are customer relegendable and the key nomenclature may be customer defined for functions dependent on the application. The keyboard includes:

- Standard alphanumeric keys in a typewriter-like format
- 10 function keys that have legends installed, two of which are system function keys
- Six unlegended keys
- 10-key keypad in a fixed data entry format
- Managers keylock
- Four terminal status indicators
- An audible alarm having three tone frequencies and two loudness levels under program control
- Ship group that includes a keytop puller and a legend sheet with 60 legends. The legend sheet consists of two colors of 30 legends each, with seven legends preprinted in each color.

The keyboard can be used in an integrated or distributed configuration. (See the "Specify" section for lock insert ordering instruction.) Prerequisite: Either the Integrated (#3325) or Distributed (#3326) Keyboard Cable. Limitation: Cannot be used with the 50-key Modifiable Keyboard (#3320). Maximum: One. Customer Setup: Yes.

Integrated Keyboard Cable (#3325): Provides a cable for use when the Keyboard (#3320) is to be positioned on top of the base control

unit in an integrated configuration. Prerequisite: 50-Key Modifiable Keyboard (#3320) or Alphanumeric Keyboard (#3322). Maximum: One. Limitation: Mutually exclusive with Distributed Keyboard Cable (#3326). Field Installation: Yes. Customer Setup: Yes.

Distributed Keyboard Cable (#3326): Provides a 3.8m (12.5 ft) cable for use when the keyboard and base control unit are to be distributed. This cable is also required to attach to the 1520 Model A02. Prerequisite: 50-Key Modifiable Keyboard (#3320) or Alphanumeric Keyboard (#3322) or 1520 Model A02. Maximum: Two. One keyboard and one 1520 Model A02 can be attached. Limitation: Mutually exclusive with Integrated Keyboard Cable (#3325). Field Installation: Yes. Customer Setup: Yes.

Key-Button Kit-Retail Format (#3330): Provides an engraved set of numeric keybuttons with dual legends for the retail environment. These keybuttons can be substituted for the standard numeric keybuttons. See the "IBM 4680 Store System: Selecting Hardware and Software Components" manual (GA27-3691) for legend details. Prerequisite: 50-Key Modifiable Keyboard (#3320). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Shopper Display (#3339): Provides a display with one row of eight numeric characters and six function indicators for shopper viewing. An attachment cable, brackets and a pedestal are shipped with the display that will allow the display to be mounted in an integrated configuration. Prerequisite: Display Extension Cable (#3342) for distributed configurations. Limitation: This display must be used with a display that can function as a system display, either the 40-Character Alphanumeric (#3343), the Operator Display (#3340) or one of the Video Displays: 127mm (5 inch) (Accessory), 300mm (12 inch) (#3354) or the 346mm (14 inch) (#3352) Color Display. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Operator Display (#3340): Provides a display with two rows of 20 alphanumeric character positions for terminal operator viewing. The display can display numeric and alphanumeric data such as item number, description and guidance information. Characters are formed using a 5 x 7 dot matrix. Mounting brackets shipped with the display allow the display to be mounted on the keyboard or on a standalone mount. An integrated cable is part of the display. Prerequisite: An Extension Cable (#3342) is required for distributed configurations. Limitation: This display can be used alone or with additional displays such as a second Operator Display, the Shopper Display, the 40-Character Alphanumeric Display, the 127mm (5 inch) Monochrome Display, the 300mm (12 inch) Monochrome Display or the 346mm (14 inch) Color Display. The Operator Display cannot be mounted on the 50-Key Modifiable Keyboard or the Alphanumeric Keyboard with the Magnetic Stripe Reader. Maximum: Two. Customer Setup: Yes.

Display Extension Cable (#3342): A 2.8m (9 ft) extension cable for use when the Operator Display (#3340) or the Shopper Display (#3339) and the 4683 base control unit are to be distributed. Prerequisite: Shopper Display (#3339) or Operator Display (#3340). Maximum: Two. Customer Setup: Yes.

40-Character Alphanumeric Display (#3343): Provides a 40-character operator/customer display consisting of two rows of 20 characters each. Character formation uses a dot matrix. It displays both numeric and alphanumeric data such as item number, description and guidance information. A mounting pedestal, which allows the display to tilt and rotate for optimum viewing, is provided. The display can be used in an integrated or distributed configuration. Prerequisites: Either the Integrated (#3344) or Distributed (#3345) Alphanumeric Display Cable. Limitation: This display can be used alone or with additional displays: a second 40-Character Alphanumeric Display, the Operator Display, the Shopper Display, the 127mm (5 inch) Monochrome Display, or the 300mm (12 inch) Monochrome Display or the 346mm (14 inch) Color Display. Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

Integrated Alphanumeric Display Cable (#3344): Provides a cable for use when the 40-Character Alphanumeric Display is to be positioned on top of the 4683 base control unit in an integrated configuration. Prerequisite: 40-Character Alphanumeric Display (#3343). Maximum: One per 40-Position Alphanumeric Display. Limitation: Mutually exclusive with a Distributed Alphanumeric Display Cable

(#3345). Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

Distributed Alphanumeric Display Cable (#3345): Provides a 3.8m (12.5 ft) cable for use when the 40-Character Alphanumeric Display and 4683 base unit are to be distributed. A short display mounting pedestal for use in a distributed configuration is shipped with this cable. Prerequisite: 40-Character Alphanumeric Display (#3343). Maximum: Two. Limitation: Mutually exclusive with an Integrated Alphanumeric Display Cable (#3334). Field Installation: Yes. Customer Setup: Yes.

Note: (Canada only) The 127mm (5 inch) Monochrome Display is listed in the "Accessories" section. <)

346mm (14 inch) Color Display (#3352): Provides a color display with program controlled character size. The screen format may be either 480 characters (12 lines of 40 characters), or 2,000 characters (25 lines of 80 characters). Prerequisite: Feature Expansion A (#4000), the 346mm (14 inch) Display Cable (#3353) and a power cable (#3357 or #3758). Limitation: The color display cannot be integrated on the 4683 base units or cash drawers. Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

346mm (14 inch) Display Cable (#3353): Provides a 4m (13.1 ft) cable for attaching the color display to Feature Expansion A (#4000). Prerequisite: 346mm (14 inch) Color Display. Maximum: Two. Customer Setup: Yes.

300mm (12 inch) Monochrome Display (#3354): Provides a monochrome display with programmed control character size. The screen format may be either 480 characters (12 lines of 40 characters) or 1,920 characters (24 lines of 80 characters). Prerequisite: Feature Expansion A (#4000), a Distributed 300mm (12 inch) Display Cable (#3355) and a power cable. Limitation: This display cannot be integrated. Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

The 300mm (12 inch) Monochrome Display and the required display line cord part numbers are listed below by country:

300mm (12 inch) Monochrome Line Display Cord P/N P/N Country		
6319014	6952297	Canada
6319016	6952294	Japan, Taiwan Philippines
6405255	6952317	Indonesia
6405255	6952353	Singapore
6405274	6952353	Malaysia, Hong Kong
6405255	6952308	Australia, New Zealand

Distributed 300mm (12 inch) Display Cable (#3355): Provides a 4m (13.1 ft) cable to connect the display (#3354) to Feature Expansion A (#4000). Prerequisite: 300mm (12 inch) Monochrome Display (#3354). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Pedestal (#3356): Provides a mounting pedestal that tilts and swivels for the 300mm (12 inch) Monochrome Display. Prerequisite: 300mm (12 inch) Monochrome Display. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Power Cable - 2.8mm (9 ft) (#3357): Provides a line cord for the 300mm (12 inch) Monochrome Display or 346mm (14 inch) Color Display. Prerequisite: 300mm (12 inch) Monochrome Display or 346mm (14 inch) Color Display. Limitation: Mutually exclusive with Power Cable - 1.8m (6 ft) (#3358). Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

346mm (14 inch) Color Display Pedestal (#3359): Provides an optional mounting pedestal that tilts and swivels for the 346mm (14 inch) Color Display (#3352). Prerequisite: 346mm (14 inch) Color Display (#3352). Maximum: Two. Customer Setup: Yes.

Cash Drawer with Fixed Till (#3360): Provides a cash drawer with a removable till that contains fixed coin and bill compartments. The cash drawer has a media slot that accommodates approximately a 20.0mm (0.75 inch) stack of documents. Cash drawer opening is under application program control. A cash drawer lock is provided. See "Specify" section for lock insert ordering instructions. Prerequisites: Integrated cash drawer cable (#3364) or Distributed Cash Drawer Cable (#3365). A lock insert must be selected from the Specify codes (#9200 through #9221). Maximum: Two cash drawers (either #3360 and/or #3361) can be used. Field Installation: Yes. Customer Setup: Yes.

Cash Drawer with Adjustable Till (#3361): Provides a cash box with a removable till that contains adjustable coin and bill compartments. The cash drawer has a media slot that accommodates approximately a 20.0mm (0.75 inch) stack of documents. Cash drawer opening is under application program control. A cash drawer lock is provided. See "Specify" section for lock insert ordering instructions. Prerequisites: Integrated Cash Drawer Cable (#3364) or Distributed Cash Drawer Cable (#3365). A lock insert must be selected from the specify codes (#9200 through #9223). Maximum: Two cash drawers (either #3360 and/or #3361) can be used. Field Installation: Yes. Customer Setup: Yes.

Integrated Cash Drawer Cable (#3364): Provides a cable for use when the cash drawer and base unit are to be used in an integrated configuration. Prerequisite: Cash Drawer #3360 or #3361. Maximum: One per cash drawer. Limitation: Mutually exclusive with Distributed Cash Drawer Cable (#3365). Field Installation: Yes. Customer Setup: Yes.

Distributed Cash Drawer Cable (#3365): Provides a 3.8m (12.5 ft) cable for use when the cash drawer and base unit are to be distributed. Prerequisite: Cash Drawer #3360 or #3361. Maximum: One per cash drawer. Limitation: Mutually exclusive with Integrated Cash Drawer Cable (#3364). Field Installation: Yes. Customer Setup: Yes.

Non-IBM Special Attachment Cable (#3466): Provides a 4m (13.1 ft) cable to enable a non-IBM cash drawer, or an external alarm, to be attached to the 4683 Models 1 and 2 base units. Contact the IBM Industry Relations department for the Product Attachment Information document that defines the special attachment interface required for attachment. Maximum: Two. Limitation: Mutually exclusive with the Integrated or Distributed Cash Drawer Cables (#3364) and (#3465). Field Installation: Yes. Customer Setup: Yes.

Printer (#3380): Provides a wire matrix, bidirectional printer that prints up to a 38-character print line at two print stations. One station provides customer receipt and/or document insert printing. Only one type of document can be printed at any one time. Printing is under application program control. The journal is the second station. It includes a paper motion sensor to detect an "out-of-paper" condition or a paper jam that prevents feeding. The journal cover includes a lock (see "Specify" section for lock insert ordering instructions). The customer receipt and journal stations will accept 88.9mm (3.5 inch) diameter roll paper, 69.85mm (2.75 inch) wide. In addition to standard character sets, an all-points addressable capability allows program-controlled special graphics and logo printing in the customer receipt or document insert station. The matrix print head is customer replaceable and the printer uses a replaceable cartridge ribbon. (See "Supplies" and "Replacement Parts" sections for replacement matrix print head and ribbon ordering instructions.) The printer can be used in an integrated or distributed configuration depending on the attachment cable selected (#3384 or #3385). Prerequisite: Integrated Printer Cable (#3384) or Distributed Printer Cable (#3385). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Integrated Printer Cable (#3384): Provides a cable for use when the printer is to be positioned on top of the base unit in an integrated configuration. The printer ribbon and two rolls of paper for the journal and customer receipt stations are shipped with the cable. Prerequisite: Printer (#3380). Maximum: One. Limitation: Mutually exclusive with Distributed Printer Cable (#3385). Field Installation: Yes. Customer Setup: Yes.

Distributed Printer Cable (#3385): Provides a 3.8m (12.5 ft) cable for use when the printer and base unit are to be distributed. The printer ribbon and two rolls of paper for the journal and customer receipt stations are shipped with the cable. Prerequisite: Printer (#3380). Maximum: One. Limitations: Mutually exclusive with Integrated Printer Cable (#3384). Field Installation: Yes. Customer Setup: Yes.

Feature Expansion A (#4000): Provides an expansion option that permits the direct cable attachment of the 127mm (5 inch) Monochrome Display, the 300mm (12 inch) Monochrome Display or the 346mm (14 inch) Color Display. See "Accessories" section for ordering the 127mm (5 inch) display and associated cables. Limitation: Feature Expansion A (#4000) can coexist with one Feature Expansion B (#4001), Feature Expansion C (#4002) or Feature Expansion D (#4003). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Note: Feature Expansion A (#4000) options shipped before third quarter 1986 will only support the 127mm (5 inch) Monochrome Display. Feature Expansion A (#4000) options shipped after third quarter 1986 will support either the 127mm (5 inch) Monochrome Display (P/N 6316710) or the 300mm (12 inch) Monochrome Display (#3354).

Feature Expansion B (#4001): Provides an expansion option that has two cable receptacles that allow the following attachments:

- Receptacle 1: One of the following can be attached:
 - Non-IBM OCR Hand-Held Reader with the non-IBM OCR Hand Held Reader Cable (#4024)
 - 1520 Hand Held Reader Model A01 with the non-IBM OCR Hand Held Reader Cable (#4024)
 - Non-IBM Scale with the non-IBM Scale Cable (#4026)
- Receptacle 2:
 - Non-IBM Coin Dispenser with the non-IBM Coin Dispenser Cable (#4028)

Maximum: Up to two Feature Expansion B (#4001) can be used. Limitation: One Feature Expansion B option can coexist with one Feature Expansion A (#4000), Feature Expansion C (#4002) or Feature Expansion D (#4003). Field Installation: Yes. Customer Setup: Yes.

Feature Expansion C (#4002): Provides an expansion option that has four cable receptacles that allow the following attachments:

- Receptacle 1: One of the following can be attached:
 - Non-IBM OCR Hand-Held Reader with the non-IBM OCR Hand Held Reader Cable (#4024)
 - 1520 Hand Held Reader Model A01 with the non-IBM OCR Hand Held Reader Cable (#4024)
 - Non-IBM Scale with the non-IBM Scale Cable (#4026)
- Receptacle 2:
 - Non-IBM Coin Dispenser with the non-IBM Coin Dispenser Cable (#4028)
- Receptacle 3:
 - Asynchronous Communication device with the Asynchronous Communication Cable RS-232-C (#4020)
- Receptacle 4:
 - Asynchronous communication RS-232-C interface or a 20ma current loop interface with the Asynchronous Communication Cable RS-232-C or 20ma Current Loop (#4022)

Maximum: Up to two Feature Expansion C (#4002) options may be used. Limitation: One Feature Expansion C option can coexist with one Feature Expansion A (#4000), Feature Expansion B (#4001) or Feature Expansion D (#4003). Field Installation: Yes. Customer Setup: Yes.

Feature Expansion D (#4003): Provides an expansion option having five cable receptacles that allow the following attachments:

- Receptacle 1: One of the following can be attached:
 - Non-IBM OCR Hand-Held Reader with the non-IBM OCR Hand Held Reader Cable (#4024)
 - 1520 Hand Held Reader Model A01 with the non-IBM OCR Hand Held Reader Cable (#4024)
- Receptacle 2:
 - Non-IBM Coin Dispenser with the non-IBM Coin Dispenser Cable (#4028)
- Receptacle 3:
 - Asynchronous Communication device with the Asynchronous Communication Cable RS-232-C (#4020)
- Receptacle 4:
 - Asynchronous communication RS-232-C interface or a 20ma current loop interface with the Asynchronous Communication Cable RS-232-C or 20ma Current Loop (#4022)
- Receptacle 5:
 - Magnetic Wand Reader (#4016)

Maximum: Up to two Feature Expansion D (#4003) options can be used. Limitation: One Feature Expansion D option can coexist with one Feature Expansion A (#4000), Feature Expansion B (#4001) or Feature Expansion C (#4002). Field Installation: Yes. Customer Setup: Yes.

Note: Feature #4003 will be available by September 30, 1986. The 1520 Hand-Held UPC/EAN Scanner Model A02 attaches directly to the 4683 base control unit and does not require a feature expansion option.

Magnetic Stripe Reader (#4010): Provides a track 2, 75 bpi Magnetic Stripe Reader. This Magnetic Stripe Reader mounts on the 50-Key Modifiable Keyboard (#3320) or the Alphanumeric Keyboard (#3322). Prerequisite: 50-Key Modifiable Keyboard (#3320). Limitations: Cannot be mounted on the 50-Key Modifiable Keyboard or Alphanumeric Keyboard with the Operator Display (#3340). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Note: A test card is shipped with each Magnetic Stripe reader. See "Accessories" section for additional test cards or Magnetic Stripe Reader Cleaning Cards.

Security Base (#4012): Provides a base plate for fastening the 50-Key Modifiable Keyboard (#3320), Operator Display (#3340), Printer (#3380), and 127mm (5 inch) Monochrome Display. This plate may be mounted on the 4683 base unit, the cash drawer (#3360 or #3361), or on a counter top. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

3687 Checkout Scanner Model 2 Adapter (#4014): Provides a cable and adapter unit for attaching the IBM 3687 Checkout Scanner Model 2 to the 4683 Model 1 or Model 2. The 4.6m (15.0 ft) cable connects to the 4683 Model 1 or Model 2 base unit and to the adapter unit. The adapter unit plugs into the 3687 Checkout Scanner Model 2 and fits in the recessed area in the front of the 3687 Scanner. The 3687 Checkout Scanner Model 2 can coexist with the IBM 1520 Model A02 Hand-Held Scanner on a 4683 Model 1 or Model 2. Prerequisite: 3687 Checkout Scanner Model 2. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Magnetic Wand Reader (#4016): Provides a hand-held wand to read single-track delta-distance encoded magnetic merchandise tickets and other magnetic stripes using this coding technique. The wand includes a 2m (6.6 ft) flexible cable. Prerequisite: Feature Expansion D (#4003). Maximum: One per 4683 Model 1 or 2. Field Installation: Yes. Customer Setup: Yes.

Note: The encoding specifications for Feature #4016 will be furnished by IBM on request.

Asynchronous Communication Cable RS-232-C (#4020): Provides a 4m (13 ft) cable that plugs into an 8-pin receptacle on Feature Expansion C (#4002) or Feature Expansion D (#4003) and terminates at a 25-pin "D" type connector. Equipment meeting the EIA RS-232-C interface specification may be attached at distances up to 76m (250 ft) using a customer-provided extension cable that is compatible with the 25 pin "D" type connector. The ASYNC protocols are under application program control. Prerequisite: Feature Expansion C (#4002) or Feature Expansion D (#4003). Maximum: One per Feature Expansion C (#4002) or Feature Expansion D (#4003). Field Installation: Yes. Customer Setup: Yes.

Asynchronous Communication Cable RS-232-C or 20ma Current Loop (#4022): Provides a 4.0m (13.1 ft) cable that plugs into a 16-pin receptacle on Feature Expansion C (#4002) or Feature Expansion D (#4003) and terminates at a 25-pin "D" type connector. The interface provides for RS-232-C or current loop/20ma attachment. Equipment meeting the EIA RS-232-C interface specification may be attached at distances up to 76m (250 ft) using a customer-provided extension cable that is compatible with the 25-pin "D" type connector. Equipment meeting the current loop interface specifications may be attached at distances up to 76m (250 ft) by using a customer provided extension cable that is compatible with the 25-pin "D" type connector. The ASYNC protocols are under application program control. Prerequisite: Feature Expansion C (#4002) or Feature Expansion D (#4003). Maximum: One per Feature Expansion C (#4002) or Feature Expansion D (#4003). Field Installation: Yes. Customer Setup: Yes.

Non-IBM OCR Hand-Held Reader Cable (#4024): Provides a 4.0m (13.1 ft) cable to enable a non-IBM OCR Hand-Held Reader of the 1520 Model A01 Hand-Held Scannerto be attached to Feature Expansion B (#4001), Feature Expansion C (#4002) or Feature Expansion D (#4003). The non-IBM OCR Hand-Held Reader must meet the requirements stated in the "IBM Retail System OCR A/B Wand Reader Product Attachment Information" document which is available from IBM Industry Relations. This attachment cable terminates with a 25-pin "D" type connector. The non-IBM OCR Hand-Held Reader must be compatible with this connector. Prerequisite: Feature Expansion B (#4001), C (#4002) or D (#4003). Maximum: One non-IBM OCR Hand-Held Reader per 4683 Model 1 or 2. Field Installation: Yes. Customer Setup: Yes.

Non-IBM Scale Cable (#4026): Provides a 4m (13.1 ft) cable to enable a non-IBM Scale to be attached to Feature Expansion B (#4001) or C (#4002). Contact the IBM Industry Relations department for the Product Attachment Information document that defines the Scale serial interface required for attachment. Prerequisite: Feature Expansion B or C. Maximum: One per Feature Expansion B or C. Field Installation: Yes. Customer Setup: Yes.

Non-IBM Coin Dispenser Cable (#4028): Provides a 4m (13.1 ft) cable to enable a non-IBM Coin Dispenser to be attached to Feature Expansion B (#4001) or C (#4002) or D (#4003). Contact the IBM Industry Relations department for the Product Attachment Information document that defines the Coin interface required for attachment. Prerequisite: Feature Expansion B or C or D. Maximum: One per Feature Expansion B or C or D. Field Installation: Yes. Customer Setup: Yes.

Base Unit Cable 6 Meters (19.7 ft) (#4030): Provides a 6m (19.7 ft) cable to connect a 4683 Model 2 to a 4683 Model 1 or A01 base unit or to connect a 4683 Model 2 to a 4683 Model 2 Attachment Adapter Kit installed in a system unit of an IBM Personal Computer, IBM Personal XT, IBM Personal Computer AT, or IBM Personal System/2 Model 30. The cable permits a direct attachment of the base control units without interspersed customer wiring. Prerequisite: A 4683 Model 2. Limitation: Mutually exclusive with Base Unit Cable (#4032) or (#4034). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Base Unit Cable 20 Meters (66 ft) (#4032): Provides a 20m (66 ft) cable to connect a 4683 Model 2 to a 4683 Model 1 or A01 base unit or to connect a 4683 Model 2 to a 4683 Model 2 Attachment Adapter Kit installed in a system unit in an IBM Personal Computer, IBM Personal XT, IBM Personal Computer AT, or IBM Personal System/2 Model 30. The cable permits a direct attachment of the base control units or system unit without interspersed customer wiring. Prerequisite: A 4683 Model 2. Limitation: Mutually exclusive with Base Unit Cable (#4030) or (#4034). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

uisite: A 4683 Model 2. Limitation: Mutually exclusive with Base Unit Cable (#4030) or (#4034). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Base Unit Cable 4 Meters (13.1 ft) (#4034): Provides two identical 4m (13.1 ft) cables used to interconnect customer wiring between a 4683 Model 1 or A01 and a 4683 Model 2 base unit or to connect a 4683 Model 2 to a 4683 Model 2 Attachment Adapter Kit installed in a system unit of an IBM Personal Computer, IBM Personal XT, IBM Personal Computer AT, or IBM Personal System/2 Model 30. These cables are required: 1) when the distance between the 4683 base control units is greater than 20m (66 ft) but less than 150m (500 ft) and 2) when the base unit of the 4683 Model 2 and the system unit of the IBM Personal Computer, IBM Personal Computer XT, IBM Personal Computer AT, or IBM Personal Product Model 30 is greater than 20m (66 ft) but less than 122m (400 ft). The customer wiring must conform to the IBM Cabling System. See "IBM 4680 Store System: Preparing Your Site" (GA27-3692), for additional information. Prerequisite: A 4683 Model 2. Limitation: Mutually exclusive with Base Unit Cable (#4030) or (#4032). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Machine Elements: Some of the above Special Features are also available as Machine Elements. Machine Elements are ordered by part number and can be ordered independently of the 4683 base control unit. Machine Elements are not eligible for IBM maintenance agreement service when not used in conjunction with a 4683 base control unit, and are not eligible for discounts except under the Volume Procurement Amendment. Proof of purchase is required for warranty service from IBM or from an IBM Authorized Value Added Dealer.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Accessories are available from IBM Direct for Supplies/Accessories.

Storage Retention Battery (P/N 4783928): A nickel cadmium battery that will provide power to retain data and programs in main storage during a power interruption. A battery is shipped with each 4683 Model 1 base unit. For replacement batteries order P/N 4783928 (or equivalent).

Tills and Till Cover with Lock: Additional cash tills and till covers with locks may be ordered.

	P/N
Cash Till with Fixed Bill Dividers (without Cover)	4783879
Cash Till with Adjustable Bill Dividers (without Cover)	4783880
Cash Till Cover with Lock and Keys	6316718

Matrix Print Head (P/N 4483100): A matrix print head is shipped with each printer. For replacement print heads, order P/N 4483100.

Locks: The cash drawer, printer journal cover, and keyboard are shipped with lock mechanisms and lock inserts as specified on the initial order. For replacement lock inserts and keys, order the following part number that corresponds to the IBM lock serial number stamped on the face of the installed lock insert. (Replacement keys will not be provided separately from the lock insert which includes two keys.)

	Lock Serial No.	P/N
Random Lock	MM750 thru MM925	4783901
Specific Lock	MM926	4783902

Specific Lock	MM927	4783903
Specific Lock	MM928	4783904
Specific Lock	MM929	4783905
Specific Lock	MM930	4783906
Specific Lock	MM931	4783907
Specific Lock	MM932	4783908
Specific Lock	MM933	4783909
Specific Lock	MM934	4783910
Specific Lock	MM935	4783911
Specific Lock	MM936	4783912
Specific Lock	MM937	4783913
Specific Lock	MM938	4783914
Specific Lock	MM939	4783915
Specific Lock	MM940	4783916
Specific Lock	MM941	4783917
Specific Lock	MM942	4783918
Specific Lock	MM943	4783919
Specific Lock	MM944	4783920
Specific Lock	MM945	4783921
Blank Insert	Blank	4783923

Keybutton Legend Sheets-Preprinted: Provides a set of preprinted legend sheets in six colors for the 50-Key Modifiable Keyboard. Order by part number.

Canadian English	6316691
Canadian French	6316702
Spanish	6316700
French	6316693
German	6316692
Italian	6316699
Norway	6316698
Spanish	6317000
Swedish	6316697

Keybutton Legend Sheets: Blank key button legend sheets may be ordered for customers who require unique legends. Legend sheets are available in six colors. Each legend sheet has 133 single legends and 15 double legends. Order the following part number for the color required.

Item	Color	P/N	Pkg. Qty.
Legends	White	63X5179	25
Legends	Yellow	63X5180	25
Legends	Red	63X5181	25
Legends	Blue	63X5182	25
Legends	Green	63X5183	25
Legends	Tan	63X5184	25

Keybutton and Lens: Keybuttons, lens, shields and a keybutton removal device are shipped with the keyboard. Additional requirements or replacement parts may be ordered. Each item is prepackaged with multiple pieces per package as listed below.

Description	P/N	Pkg. Qty.
Standard height single lens	63X5169	50
Standard height double lens	63X5170	25
Raised single lens	63X5171	25
Raised double lens	63X5172	25
Raised single keybutton	63X5173	25
Key shield	63X5174	10
Keybutton removal device	63X5175	3

Magnetic Stripe Reader Test Card: A test card is shipped with each Magnetic Stripe Reader (#4010). For additional or replacement cards order Magnetic Stripe Reader Test Card, P/N 4055210.

Magnetic Stripe Reader Cleaning Card: Cleaning cards are not shipped with the Magnetic Stripe Reader (#4010) but may be ordered. Order Magnetic Stripe Reader Cleaning Card, P/N 6019483.

Loop Data Connector Conversion Kit: P/N 6428954 provides a data connector with a short cable and other connector parts that are required to convert from an existing store loop connector to the IBM Data Connector used on the 4680 system. The loop wiring system that is to be converted must have been installed to the IBM wiring specifications. A prerequisite is the IBM cabling system junction box, or equivalent (See "IBM Cabling System Catalog", G570-2040).

Note: In addition to the Special Features, the 127mm (5 inch) Monochrome Display may be ordered for use on the 4683 Model 1 or 2 when the 4683 is equipped with Feature Expansion A (#4000). The display unit and distributed cable are not covered under the IBM Maintenance offerings.

127mm (5 inch) Monochrome Display (P/N 6316710): Provides a monochrome display with program controlled character size. The screen format may be either 120 characters (6 lines of 20 characters) or 480 characters (12 lines of 40 characters). The display includes a cable and can be positioned on top of the 4683 base unit in an integrated configuration. A distributed cable (P/N 6316852) must be ordered when the display is to be used in a distributed configuration. Prerequisite: Feature Expansion A (#4000). Limitation: Cannot be used with a 40-Character Alphanumeric Display (#3343) or a 300mm (12 inch) Monochrome Display (#3354). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Distributed 127mm (5 inch) Display Cable (P/N 6316852): Provides a 4.0m (13.1 ft) cable for use when the display (P/N 6316710) and the 4683 base unit are to be distributed. Prerequisite: 127mm (5 inch) Monochrome Display. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

MACHINE ELEMENTS

Machine Elements may be ordered by IBM Direct Order.

SUPPLIES

Ribbons: A black ribbon cartridge (P/N 4483015 or equivalent), is required.

Paper: Printer roll paper (P/N 432767 or equivalent) 88.9mm (3.5-in.) diameter, 69.85mm (2.75-in.) wide is required at the customer receipt and journal print station. P/N 432767 provides a case of 50 rolls.

Contact your country DP supplies Coordinator.

4701 FINANCIAL COMMUNICATION CONTROLLER MODELS 1, 2, 3

THERE IS MORE THAN 1 TEXT VERSION FOR THIS PRODUCT

PURPOSE

A programmable controller for attachment of 4700 Finance Communication System terminals and 3600 Finance Communication System terminals to S/370, 303X, 308X, 3090 or 4300 Processors, S/34, S/36, S/38 or 8100 System.

MODELS 1, 2, 3

Model 1 001: A programmable controller with a base configuration of 192K bytes of machine storage, two loops, SDLC communication adapter, and one diskette drive which accommodates 1- or 2-sided removable diskettes (type 1 or 2) to provide up to 0.5 megabytes of diskette storage. May be upgraded to provide a maximum of four loops, 512K bytes of machine storage and one auxiliary diskette storage feature (0.5 or 1.0 megabyte).

Model 2 002: A programmable controller with a base configuration of 256K bytes of machine storage, two loops, SDLC communication adapter, and one diskette drive which accommodates 1- or 2-sided removable diskettes (type 1, 2, or 2D) to provide up to 1.0 megabyte of diskette storage. May be upgraded to provide a maximum of four loops, 896K bytes of machine storage and one auxiliary diskette storage feature (1.0 megabyte only). May also be upgraded to provide a maximum capacity of 60Mb of Disk Storage.

Model 3 X03: A programmable controller with a base configuration of 512K bytes of machine storage, two B-loops, SDLC communication adapter, and one diskette drive which accommodates a 2-sided removable diskette to provide up to 1.0 megabyte of diskette storage, encryption and hardware error correction capability. May be upgraded to provide a maximum of four B-loops and 16 Cluster Adapter Ports. May also be upgraded to provide a maximum capacity of 60Mb of Disk Storage. Alternatively, one or two IBM 4708 Disk Units may be attached for a maximum disk storage capacity of 176Mb. There are five models based on machine storage size as follows: Model A03=512K bytes, B03=768K bytes, C03=1.0M bytes, D03=1.28M bytes, E03=1.54M bytes.

Customer Setup (CSU): The 4701 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, refer to the GI section. One copy of the CSU Instructions and diagnostic diskette are shipped with each 4701. The CSU allowance is four days. Machine and selected specify features.

HIGHLIGHTS

Machine Storage: For the Model 1 controller the base 192K bytes of machine storage and the additional storage increments, when present, are contiguous and are available to provide the storage as required for system control, selected device, feature, or function support and user-programmable storage.

For the Model 2 controller, the base 256K bytes of machine storage and storage increments up to 512K bytes, when present, are contiguous. When total storage capacity exceeds 512K bytes, storage is divided into a user/microcode storage area and a microcode storage area, and addressing is no longer contiguous. The minimum microcode storage area is 256K bytes. Refer to the "IBM 4700 System Configurator" (GC31-2017) for a comprehensive list of storage requirements and details on determining the amount of additional storage, if any, required.

For the Model 3 controller, the base 512K bytes of machine storage and storage increments up to 1.54K, when present are contiguous.

Controls all the functions of 4700 Finance Communication System and/or 3600 Finance Communication System terminals. The 4700 Online Terminal Support for System/34 PRPQ (5799-BGB) supports the 4704 Model 1, 5210 Models G01, G02 Printers, 4710, 3603, 3610, 3611, 3616 and 3624 (multi-line display only).

Controls data transmission between terminals and the central processing site. Host data transmission via SDLC can be at speeds up to 9600 bps (38.4K bps via 8100 Loop), or via BSC at speeds up to 4800 bps dependent on the other elements of the host connection facility. Communication Link Limit information will be found in the "IBM 4700 System Configuration" (GC31-2017). The base controller also offers integrated encryption to provide security of personal identification numbers (PINs), messages and software.

All 4700 system terminals (except 4704-2 and 4704-3) and 4730 are attached by loops which may be selected to operate at speeds of 1200, 2400 or 4800 bps.

The Model 1 controller contains 192K bytes of machine storage for use as system control: device, feature, function support and user-programmable storage. One additional 64K byte storage increment and two 128K byte storage increments are available for a total of 512K bytes. For a 192K, 320K or 448K byte Model 1 controller already installed, a maximum of one additional 64K byte storage increment and, respectively, two 128K, one 128K or zero 128K byte storage increments are allowed. The Model 2 controller contains 256K bytes of machine storage. A maximum of five additional 128K byte storage increments are available for a total of 896K bytes. For a 192K, 320K or 448K byte Model 2 controller already installed, a maximum of one additional 64K byte storage increment and, respectively, five 128K, four 128K, or three 128K byte storage increments are allowed. The base Model 3 controller contains 512K bytes of machine storage. Four additional models in increments of 256K bytes up to 1.54M bytes are also available. Refer to the "IBM 4700 System Configurator" (GC31-2017) for detailed storage use information.

Two loops are provided. An optional feature providing two loops (for a total of four) is available. Houses a direct access diskette drive for 1- or 2-sided removable diskettes which provide up to 0.5 megabytes (Model 1) or 1 megabyte (Model 2 or Model 3) of diskette storage for controller data and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). One additional diskette drive may be attached. A maximum capacity of 60Mb of disk storage may be attached for temporary and permanent storage of user data (Model 2 or Model 3). Alternatively, for the Model 3 only, one or two 4708 Disk Unit(s) Model 5 may be attached for a maximum disk storage capacity of 176Mb.

The 4701 192K byte Model 2 controller has been designated as a Model A2 controllers for administrative purposes only. Additional storage increments to the Model A2 requires a model conversion via a MES. The model conversion includes 64K bytes of additional machine storage.

An optional Cluster Adapter feature is available to provide local high speed attachment. (See Cluster Adapter (#3101) description for devices supported.)

System Attachment:

Note: See Program Product pages for host support programming information.

- S/370, 303X, 308X, 3090 or 4300 Processors: Remote attachment using SDLC or BSC-3 via a 3704, 3705 or 3725 Communications Controller. BSC-3 requires optional BSC Communications feature (#1422).
- 4341, 4361, 4381, 303X, 308X or 3090 processors: Remote attachment using SDLC or BSC-3 via a 3720 Communication Controller.
- 4331 Processors: Remote attachment using SDLC or BSC-3 via the Communication Adapter on the 4331 BSC-3 requires

optional BSC Communications (#1422). Local attachment using SDLC or BSC-3 via 4331 Local Attachment feature. BSC-3 requires optional BSC Communications (#1422).

- 8100 Units (8101, 8130, 8140): Remote attachment or Direct connection using SDLC via 8100 unit Data Link features.
- Loop attachment using SDLC via 8100 data link loop; requires optional Loop Adapter (#4850). Remote loop attachment using SDLC via a 3843 Loop Control Unit; requires optional Loop Adapter (#4850).

The following attachments are supported by the DPPX/DSC capability:

- S/34 or S/36 Processors: Remote attachment or local attachment using SDLC via S/34 or S/36 Communication Adapter feature.
- S/38 Processors: Remote attachment using SNA/SDLC via S/38 Communication Attachment (#1501).

Note: Refer to the PRPQ list for applicable PRPQs.

Each 4701 operates in half-duplex mode. When operating in an SNA environment, duplex communication line operations are possible (except S/34 or S/36) with multiple 4701s attached to the line, one 4701 transmitting, while another receives. The 4701 contains a communication adapter without business machine clocking and CCITT V.24/V.28 interface for direct connections or for attaching external modems operating via SDLC at speeds up to 9600 bps or BSC-3 with optional BSC Communications feature at speeds up to 4800 bps. The Data Circuit-terminating Equipment (DCE) must provide its own clocking. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. See M2700 pages for further information.

Note: SNA and BSC Communications are mutually exclusive. Conversion in the field from one to the other requires an RPQ.

When using SDLC, the X.21 adapter for nonswitched or switched networks (#1424) is available in place of the standard EIA/CCITT interface.

The 4701 can be programmed to operate independently when the host processor is unavailable. It is also capable of controlling all terminal functions, executing arithmetic and capturing data from the terminals for later transmission to the host processor.

When used either with a non-S/370 compatible host system or without a host system, the Local Configuration Facility (LCF) specify #9490 may be ordered, see "Controller Data Support".

Transmission: The 4701 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating at speeds up to 9600 bps for SDLC links, or 4800 bps for BSC-3 links, may be used.

Modem	Speed (bps)	Facility
3833-1	2400	Nonswitched
3834-1	4800	Nonswitched
3863	2400	Switched or non-switched (voice grade lines)
3864	4800	Switched or non-switched (voice grade lines)
3865	9600	Nonswitched (voice grade lines)
3868-1	2400	Nonswitched (voice grade lines)
3868-2	4800	Nonswitched (voice grade lines)
3868-3,4	9600	Nonswitched (voice grade lines)
3872	2400	Switched or non-

Customer Responsibilities: All customers must be advised that their responsibilities include:

1. Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
2. Adequate site, system and other vendor preparation.
3. Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
4. Receipt at the customer's receiving dock, unpacking and placement of the 4701.
5. Performing 4701 checkout in accordance with supplied procedures for initial installation or relocation, and updating of controller diskettes (at customer option).
6. Physical setup, connection of cables in protected customer access areas including loop cables, cable to host communi-

cation lines/modems, and cables for Disk Storage features and Auxiliary Diskette feature.

7. Installation of the controller data support and generation of the operational diskettes, at initial controller installation and for any subsequent release distribution.
8. Checking communications to the host processor.
9. Security for erasure of data from a failing Disk Storage feature being returned to IBM. It is IBM's practice to erase any remaining data on a returned disk before reusing it.
10. Using the problem determination procedures provided with the 4701 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to (Canada only > forwarding the failing unit to an IBM-designated location or <) requesting On-Site Service (see "Maintenance" below).
11. Determining the need for any required spares.
12. Notifying IBM of intent to relocate the 4701 and following IBM instructions regarding relocation.

Maintenance: Maintenance of 4701s is available under IBM Maintenance agreement for On-Site Service. It is the customer's responsibility to setup the equipment and to determine when maintenance is required.

On-Site Service is provided during the warranty period.

Customers with 4701s not covered by IBM Maintenance Agreements may pay a time-and-material charge to have the unit(s) repaired (if the unit is repairable).

If maintenance coverage is not contracted immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement Coverage, he must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined.

If, on the basis of the inspection, it is concluded that the state of the machine precludes normal maintenance, the machine is returned to the customer without charge.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Bibliography: For information on 4701 publications, refer to the "4700 System Summary" (GC31-2016).

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Power (AC, 1-phase): Specify #2998, then select one of the following:
 - #9892 - 60 Hz/100-120V
 - #9893 - 50 Hz/100-110V
 - #9894 - 50 Hz/200-240V
- Plugs:
 - (Canada only > Specify #9890 for locking plug. If not specified, a nonlocking plug will be provided (for 60 Hz, 120V, 1-phase). <)
 - (Japan only > Specify #9890 for locking plug. If not specified a nonlocking plug will be provided (for voltages under 200V). <)
 - (Except Canada and Japan > The 3-digit WT Country Code of the DP Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each

country. If an exception to the above is required, a Country RPQ may be initiated. <)

Note: If an AC power source, other than the most common in the Country, is specified and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the Country RPQ referenced above is initiated.

A line cord of 3.0m (9.8 ft) and the country-approved plug will be provided at the time of shipment.

● Nomenclature:

Canadian French Japanese #2930
Bilingual #2934 Spanish #2931
English #2927

● Controller Storage Size: Controller storage size for Models 1 and 2 must be specified on all orders and MESs.

Select one of the following for Model 1 or 2:

#9616 256K for Model 1 or 2
#9617 384K for Model 1 or 2
#9618 512K for Model 1 or 2
#9619 640K (384K user/256K microcode) for Model 2
#9620 768K (384K user/384K microcode) for Model 2
#9621 768K (512K user/256K microcode) for Model 2
#9622 896K (512K user/384K microcode) for Model 2

No specify code is required for ordering a base 192K byte Model 1 controller. Controllers with greater than 192K bytes of machine storage have one specify code #9612 (320K bytes), #9614 (448K bytes) or #9616 (256K bytes), #9617 (384K bytes), and #9618 (512K bytes) to identify the current storage configuration.

When a storage increment is ordered via MES or via a Model A2 to Model 2 conversion, the old specify code must be deleted and the proper new specify code must be added.

● Fan-Out Communication Adapter Line Speed: For #1551, specify as follows:

Specify	Speed	Maximum Cable Length
#9181	9600 bps	30.48m (100 ft)
#9182	4800 bps	60.96m (200 ft)
#9183	2400 bps	121.92m (400 ft)

● Loop Adapter Line Speed: For #4850, specify as follows:

#9625 9,600 bps
#9629 38,400 bps

● X.21 Adapter: #9750 for switched network or #9751 for non-switched network.

● Controller Data Support: The selected controller data support is supplied when the controller is shipped. It is the customer's responsibility to install it and any subsequent levels of the data support supplied. Encryption capability via the DEA algorithm is included in the data support. This encryption capability is not available in Surinam or Hungary.

● Ordering Information for 4700 Controller Data: There are three specify codes (#9490, #9491 and #9492) for ordering controller data for the 4700 controllers. These specify codes enable the user to order each controller with the capability of creating operational diskettes either at a S/370 or S/370-compatible host system and/or at the controller site. When ordering a controller for which it is intended that operational diskettes will be generated at the controller site, use specify code #9490. When ordering the initial controller for a user who intends to generate operational diskettes using a S/370 or S/370 compatible host system, use specify #9491, and when ordering additional controllers use specify code #9492.

Distribution of controller data media, specify one of the following:

- #9490 identifies a controller which requires the capability to create operational diskettes at the controller using the Local Configuration Facility (LCF). Three controller data diskettes will be shipped with the controller.

1. Installation Diskette
2. LCF Pre-Operational Diskette
3. LCF Program Diskette

LCF requires a 4704 Display Terminal with the Alpha-meric Keyboard (#4662) for the necessary dialog between the user and the controller. An Auxiliary Diskette Drive (#1035 or #1045) is also required on at least one 4701 per enterprise to do diskette copy for backup or distribution of LCF Operational diskettes to other branch 4701 controllers.

Note: #9490 should be used to provide Controller Data Media for only those controllers which require a system generation facility at the controller. Unnecessary shipment of multiple diskettes will result if specified when not required.

- #9491 identifies the initial controller used with a S/370 or S/370-compatible host system location. The user will receive a DTR tape delivered to the address described below and an Installation diskette included with the controller.

Note: Do not specify #9491 for more than one controller per host system as this will result in the unnecessary shipment of multiple DTR tapes.

If #9491 is specified, select the specify code of the desired media:

- #9413 - 9/1600 Magnetic Tape (CSU)
- #9414 - 9/6250 Magnetic Tape (CSU)

#9492 used to order additional controllers when neither a DTR nor a pre-operational diskette is required, or when operational diskette creation is not required.

Any time #9490 or #9491 is specified, enter supplementary specifications (via AAS order entry) exactly as follows to indicate shipping address of the Host System Location. Specify #9490 or #9491 must be specified as first controller and the supplemental address completed. Do not specify #9492 for all controllers for a single customer.

- Line 1 - C/O (Name of customer)
- Line 2 - Street Address (or P.O. Box)
- Line 3 - City, Country, Postal Code.

This is the address to which the initial controller data tape will be automatically shipped.

- Cables: See "Accessories" for additional information. See also "4700 Finance Communication System, Installation Planning Manual" (GC31-2018).

(Japan only) Specify #3711 for metric screws when ordering cable connector (default will supply SAE-inch screws). (<)

SPECIAL FEATURES

Unless otherwise stated, all features available for field installation require service personnel.

NON-COMMUNICATIONS FEATURES

For specify codes #9618 and #9622, the last 8,192 bytes of machine storage are not addressable by the user.

Add'l Storage (#1008): Provides an additional 64K (65,536) bytes of machine storage. Limitations: Can only be ordered as an additional increment on already installed Model 1 192K, 320K, or 448K byte machines and Model 2 320K or 448K byte machine via MES. Maxi-

mum: One, see "Limitations". Field Installation: Yes, field only. Specify: See table below.

Add'l Storage (#1009): Provides an additional 128K (131,072) bytes of machine storage. Limitations: Model 1 is restricted to specify codes #9617 and #9618. Maximum: The maximum number of #1009 for Model 1 is two. The maximum number of #1009 for the Model 2 is five. Field Installation: Yes. For specify codes #9619, #9620, #9621 and #9622, parts removed becomes the property of IBM. Specify: See table below and controller storage size in the "Specify" section. Note: This additional storage is no longer required.

Feature and specify codes required for storage upgrades (Model 1 and 2):

ADD'L STORAGE TABLE (K bytes)

From	To Storage Size			
Stg	Specify Code			
Size	#9616	#9617	#9618	#9619
192	#1008	#1008	#1008,	X
		#1009	2 #1009	
256	X	#1009	2 #1009	3 #1009
320	X	#1008	#1008,	#1008,
			#1009	2 #1009
384	X	X	#1009	2 #1009
448	X	X	#1008	#1008,
				#1009
512	X	X	X	#1009
640	X	X	X	X
768	X	X	X	X

From	To Storage Size			
Stg	Specify Code			
Size	#9620	#9621	#9622	
192	X	X	X	
256	4 #1009	4 #1009	5 #1009	
320	#1008,	#1008,	#1008,	
	3 #1009	3 #1009	4 #1009	
384	3 #1009	3 #1009	4 #1009	
448	#1008,	#1008,	#1008,	
	2 #1009	2 #1009	3 #1009	
512	2 #1009	2 #1009	3 #1009	
640	#1009	#1009	2 #1009	
768	X	X	#1009	

For a 192K byte Model 2 upgrade, see "Model Conversions".

Notes:

- Specify #9619 = 384K user storage and 256K microcode storage.
- Specify #9620 = 384K user storage and 384K microcode storage.

- Specify #9621 = 512K user storage and 256K microcode storage.
- The minimum microcode storage is 256K bytes.
- Specify #9619 to #9622 are for Model 2 only.

Customer Order Acknowledgement Letters for purchase MESs for specify codes #9619, #9620, #9621, and #9622 will involve the removal of parts which become the property of IBM.

Auxiliary Diskette Storage 0.5 Megabyte (#1035): (Model 1) Provides approximately 560,000 bytes of additional diskette storage via a second diskette drive for 1- or 2-sided diskettes. No storage area offered by the auxiliary (or secondary) diskette will be reserved for the control program. Limitations: May not be installed with #1045. Maximum: One. Field Installation: Yes. Prerequisites: #3651.

Auxiliary Diskette Storage 1.0 Megabyte (#1045): Provides approximately 985,088 bytes of additional diskette storage via a second diskette drive for 1- or 2-sided diskettes (type 1, 2 or 2D). No storage area offered by the auxiliary (or second) diskette will be reserved for the control program. Limitations: May not be installed with #1035. Maximum: One. Field Installation: Yes. Prerequisites: #3651, or #3652 and #1065, or #3652 and #1055.

Disk Storage 15.4 Megabyte (#1055): Provides 15,423,488 bytes of disk storage when ordered with Expansion Frame (#3652). Limitations: Can only be installed with #3652, or #3652 and #1045. Cannot be installed with #1065 or #1075. Maximum: One. Field Installation: Only when ordered for delivery with expansion frame #3652. Prerequisites: #3652.

Disk Storage 30.8 Megabyte (#1065): Provides 30,846,976 bytes of disk storage when ordered with Expansion Frame (#3652). Limitations: Can only be installed with #3652, or #3652 and #1045, or #3652 and #1075. Cannot be installed with #1055. Maximum: One. Field Installation: Only when ordered for delivery with Expansion Frame #3652. Prerequisites: #3652.

Second Disk Storage 30.8 Megabyte (#1075): Provides an additional increment of 30,846,976 bytes of Disk Storage. Limitations: Can only be installed with #3652 and #1065. Cannot be installed with #1045 or #1055. Maximum: One. Field Installation: Yes. Prerequisites: #3652 and #1065.

Cluster Adapter (#3101): Provides for the local attachment of up to a maximum of eight devices with a mix of 3262 Model 3, 13 Line Printers, 4214 Model 1 Printer, 4245 Model D12, D20 Line Printers, 3178 Models C1, C2, C3, 3179 Model 1, 3180 Model 1, 3278 Model 2 (Japan only), 52 (<) Display Stations, 3279 Model 2A, S2A, 2B, S2B, 02X, 4704 Model 2 Display Stations, 4704 Model 3 Display Stations, (Japan only) 3283 Model 52, (<) (Canada only) > and 5150 or 5160 XT Personal Computer or Personal Computer AT (5170), (<) 5210 Models G01, G02 Printwheel Printers, and 3287 Model 1, 2 Printers, 6580 Displaywriter System operating like a 3262. When attaching the 3180 Model 1 Display Station, only the 1,920 and 3,564 character screen sizes are supported. The 4701 does not support all 3180 functions. When attaching the 3278 Model 2 Display Station to the device cluster adapter, no-charge 3278 RPQ 8K0880 is required. (Japan only) > When attaching the 3278 Display Station Model 52 to the Device Cluster Adapter, no-charge 3278 RPQ 7F0148 is required. (<) When attaching Displaywriter via the 3278 emulation adapter, file transfer is not supported on the 4701. When attaching the Personal Computer and Personal Computer XT, file transfer is supported on the 4701 only with the 3278/79 Emulation Adapter (#2507) and the Applications Services Program Product (6934406). See M6580(Canada only), 5150 or 5160 (<) pages for additional prerequisites and/or limitations. Limitations: Maximum distance from controller to terminal is 1,500m (4,920 ft). The 5210 printer is supported in SCS mode only. Maximum: One. RPQ required for second set of Cluster Adapters. Field Installation: Yes.

Diskette Expansion Unit (#3651): Provides a matching unit for housing an auxiliary diskette drive. The unit is cable-attached to the main unit. Limitations: Cannot be installed with #3704, #3705 or #3652. If #1035 is installed, conversion to #1045 is via RPQ 8V0099. Maximum: One. Field Installation: Yes. Prerequisites: #1035 or #1045.

Disk Expansion Unit (#3652): Provides a matching unit for housing up to 80Mb of disk storage capacity. No storage area offered by the Disk Storage features will be reserved for the control program. Limitations: Cannot be configured with #3704, #3705 or #3651. Can only attach to 4701 Model 2 and Model 3. Maximum: One. Two with RPQ 8V0223. Field Installation: Yes. Prerequisites: #1055, or #1045 and #1055, or #1065, or #1065 and #1075, or #1045 and #1065.

Disk Unit Redrive Adapter (#3704): Provides the attachment capability for one IBM 4708 Disk Unit Model 5. Limitations: May only be installed in a 4701 Model 3. May not be installed with #3705, #3651 or #3652. Maximum: One. Field Installation: Yes. The 4708 Disk Unit must be present at time of installation.

Disk Unit Redrive Adapter (#3705): Provides the attachment capability for two IBM 4708 Disk Units Model 5. Limitations: May only be installed in a 4701 Model 3. May not be installed with #3704, #3651 or #3652. Maximum: One. Prerequisite: Specify #9652 must be ordered on each second 4708 Disk Unit. Field Installation: Yes. The 4708 Disk Units must be present at time of installation.

Note: To accommodate 4708 attachment to 4701-003, switched must be set in the 4701-003 by Field Engineering.

Add'l Loops (#4745): Provides two additional loops for attachment of additional 4700 Finance Communications System or 3600 Finance Communications System terminals. Maximum: One feature providing two loops. Field Installation: Yes.

COMMUNICATIONS FEATURES

BSC Communications Without Business Machine Clocking (#1422): Required for attachment to communications lines through an external modem which does have internal clocking at speeds up to 4800 bps when operating with Binary Synchronous Communications BSC-3. Limitations: Cannot be installed with #4850, #1424. Maximum: One. Field Installation: Not recommended. Note: SNA and BSC communications are mutually exclusive. Conversion in the field from one to the other requires an RPQ.

X.21 Adapter for Nonswitched or Switched Networks (#1424): This feature provides an interface and 6m cable for attachment to an X.21 native nonswitched network with no changes to existing SNA/SDLC procedures for controlling nonswitched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for nonswitched point-to-point and multi-point communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. Also provides an interface adapter and six meter cable for attachment to the X.21 Switched Network. SDLC Communications at speeds of 2400, 4800 and 9600 bps are supported. Limitations: Cannot be installed with #1422 or #4850. Maximum: One. Field Installation: Not recommended. Specify: #9750 for switched network or #9751 for nonswitched network.

Fan-Out Communications Adapter (#1551): Permits local attachment of up to four 4730 Personal Banking Machines or 4736 Personal Banking Machines communicating via SDLC. Limitations: Cannot be installed with #3701. Maximum: One. Field Installation: Yes. Prerequisites: #4502. Specify: One of the following line speeds:

Specify	Speed	Maximum Cable Length
#9181	9600 bps	30.48m (100 ft)
#9182	4800 bps	60.96m (200 ft)
#9183	2400 bps	121.92m (400 ft)

Note: All attached 4730s and 4736s will run at the selected speed.

EIA/CCITT Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external modem for communications attachment to remote 4730 Personal Banking Machines and 4736 Personal Banking Machines via a SDLC at speed up to 9600 bps. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. Limitations: Cannot be installed with

#1551. Maximum: One. Field Installation: Yes. Prerequisites: #4502.

SDLC Communications Adapter Without Business Machine Clocking (#4502): Required to communicate with local or remote 4730 Personal Banking Machines and 4736 Personal Banking Machines using SDLC at speeds from 1200 bps to 9600 bps. Limitations: Can only be used to attach the 4730 Personal Banking Machine. Maximum: One. Field Installation: Yes.

Loop Adapter (#4850): This feature provides the ability for the 4701 controller to attach to a direct or data link loop of the 8100 System. Direct Loop attachment supports up to 38.4K bps. Data link loop attachment supports 4800 and 9600 bps. A direct attached loop can use a 9.6K or 38.4K Hz carrier; a data link attached loop uses a 9.6K Hz carrier. Specify: One of the following must be specified: #9625 for 9.6K Hz carrier or #9629 for 38.4K Hz carrier. All terminals on a loop must use the same carrier frequency. Limitations: Cannot be installed with #1424 or #1422. Maximum: One. Field Installation: Not recommended.

MODEL CONVERSIONS

Model 1 may be converted to a Model 2 having 256K, 384K or 512K bytes of machine storage.

Model 1s with 192K, 320K or 448K bytes of machine storage will be converted to Model 2s with 256K, 384K, or 512K bytes respectively. When ordering either of these two conversions, order #9998 for administrative purposes only.

In addition to the model conversion, one storage feature #1008 and a no-charge RPK S80005 must be ordered.

Model 1s with 256K, 384K, or 512K bytes of storage will be converted to Model 2s of the same machine storage size. In addition to the model conversion, a no-charge RPK S80005 must be ordered. To upgrade to larger machine storage sizes see the table for the features that must be added to the Model 2 to reach the desired storage size. Parts removed become the property of IBM. Model 2s installed with 192K, bytes of machine storage have been designated as Model A2 for administrative purposes only. Adding storage increments to Model A2 requires conversion from a Model A2 to a Model 2. This conversion includes 64K bytes of machine storage. Parts removed become the property of IBM. If Expansion Frame (#3651) is installed, it must have a Auxiliary Diskette Storage 1.0 Megabyte (#1045) installed. See "Limitations" under Expansion Frame (#3651).

A Model A02 or 002 may be converted to a Model XX3 as specified in the following model conversion table. Also shown are the model conversions allowed between Model XX3s.

Frm	Stg	Spe-	To Mdl	Storage	Size		
Mdl	Size	Code	512K	768K	1.0M	1.28M	1.54M

ACCESSORIES

Keylock Cable Assembly (P/N 6018769): Replacement keylock cable assembly (used to load Master key) may be purchased from IBM. Order via MES from plant of manufacture

Cables: Shielded twisted-pair cable is available for attaching 4700 terminals to the 4701 controller in a loop configuration. The loop can be implemented using the IBM Cabling System or banking loop cable. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

IBM Cabling System: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the System Supplies operation within your country.

Banking Loop Cable: For proper identification, installation, and application of cable and associated accessories, refer to "4700 Finance Communication System - Installation Planning Manual", GC31-2018.

The following are "X" length cables with maximum length shown for attachment of 3262, 3287, 3278 to a 4701:

Cable	Assem No	Use	Length
(Japan only>			
8249922	Cable Assembly-		
	Metric CCITT	6m (20 ft)<)	
6018886	Cable Assembly-		
	Multi-use Loop	4.27m (14 ft)	
5718197	Cable Assembly-		
	X.21	6m (20 ft)	
5718195	Cable Extender-		
	X.21	0.3m (1 ft)	
8249921	Cable Assy, (Inch)-		
	EIA/CCITT	6m (20 ft)	
1563155	Loop Cable		
	Assembly	610m	
		(2,000 ft)	

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. Maximum distance from controller to terminal is 610m (2,000 ft.) using shielded twisted-pair cable or 1,500 meters (4,920 ft.) using coaxial cable.

Twisted-pair Cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide", GA27-3361. For pricing and ordering information, refer to the System Supplies operation within your country.

Coaxial cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning", GA27-2787, and "Coaxial Cable and Associated Manual", GA27-2805.

Note: Standard length communication cables are automatically shipped with the 4701.

GENERAL ACCESSORIES

For delivery with the machine (if offered), specify the appropriate feature number on 4700 machine order. For delivery at any other time, specify the appropriate part number on parts and supplies requisition.

Filters: Anti-glare filters protect against light reflection and provide either a yellow character display on a brown background (amber) or bright green characters on a dark green background (green). One filter is provided with each 4700 display terminal.

Cradle: The display monitor may be mounted in a cradle to provide a vertical tilt capability which allows the display operator to adjust for the best viewing angle within plus or minus 30 degrees. The cradle may be set on a counter top or be mounted to the under side of a horizontal surface. A bracket supplied for hanging the cradle provides a swivel capability.

Magnetic Stripe Reader: Has read capability only. The MSR is capable of reading the contents of ANSI Track 2 (75 bpi) on a credit or other plastic card.

Dual Density Magnetic Stripe Reader: Has read capability only. This device is capable of reading the contents of ISO Track 2 of a credit or other plastic card, or a magnetic striped savings book encoded at 210 bpi on a 4700 or 3600 encoder.

Magnetic Stripe Reader/Encoder: Has read and encode capability. The device is capable of reading the contents of Track 2 on a credit card (encoded at 75 bpi according to the ANSI Standard X4.16) or an ID card or passbook encoded at 210 bpi on a 4704 or 3604, or equivalent. The Magnetic Stripe Reader/Encoder is also capable of reading the contents of a track encoded at 210 bpi in accordance with JUCC Specifications. The device encodes at a density of 210 bpi in the IBM Passbook Format. The slot in the unit is designed to accept documents ranging in thickness from 0.25mm (0.010 in.) (excluding magnetic stripe), to 0.84mm (0.033 in.) (including magnetic stripe). It will accept plastic credit cards and ID cards or one cover of a magnetically-encoded passbook.

Magnetic Stripe Reader/Encoder with Track 3 Read: Has read and encode capability. The device is capable of reading the contents of ISO track 2 (at 75 bpi) and Track 3 (at 210 bpi) of credit or ID cards. The unit is also capable of reading and encoding a magnetic striped savings book encoded by a 4700 device or according to ISO DP8-84 or DIN 32744.

Cleaning Card: A card which is used for cleaning the magnetic head on a Magnetic Stripe Reader.

Encrypting PIN Keypad: A 12-key numeric keypad that has the Data Encryption Algorithm (DEA) implemented in hardware for Personal Identification Number (PIN) encryption within the keypad prior to transmission to a 4704 display terminal.

Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the numeric "0". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the encrypting PIN keypad is ready to accept entry. Data entered from the encrypting PIN keypad is not displayed on the 4704 to which it is attached. Prerequisites: A 4704. Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Non-Encrypting PIN Keypad: A 12-key numeric keypad for entry of a Personal Identification Number (PIN) to a 4704. Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the numeric "0". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the PIN keypad is ready to accept entry. Data entered from the PIN keypad is not displayed on the 4704 to which it is attached. Prerequisites: A 4704. Note: 4700 non-encrypting PIN keypad and 3600 PIN keypad not interchangeable. Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Encrypting PIN Keypad Privacy Shield: Attaches to the encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Non-Encrypting PIN Keypad Privacy Shield: Attaches to the non-encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the non-encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the non-encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Keypad Protective Caps: Clear plastic caps which cover each non-engraved keypad to protect the label from normal wear and tear. These may be ordered to replace, if required, the ones shipped with the 4704 keyboards.

Keypad Label Sheets: Sheets of 30 labels each for use on the 4704 keypads. The blank sheet contains 30 blank labels. The preprinted sheet contains 16 blank labels and the following preprinted labels: Digits 0 through 9, 00, 000, (. period), and (, comma).

Document Holder: A holder for documents to be fed by the operator into the 4723 document entry slot. The holder is to be placed on the table surface and positioned in front of 4723 where convenient to the customer. It provides added visibility of the documents as well as being convenient when feeding them into the 4723.

ACCESSORY SUMMARY

SUPPLIES

The 4701 uses a standard IBM Diskette type 1, 2 or 2D or equivalent.

4701 FINANCE COMMUNICATION CONTROLLER MODEL 5

PURPOSE

A programmable controller for attachment of 4700 Finance Communication System terminals and 3600 Finance Communication System terminals to S/370, 303X, 308X, 3090, 4300 processors or 8100 Systems.

MODEL 5

Model 5 005: A programmable controller with a base configuration of one diskette drive which accommodates one-sided removable diskette, one loop, 192K bytes of machine storage, and SDLC communication adapter.

Customer Setup (CSU): Machine and selected specify features.

Machine Storage: The base 192K bytes of machine storage are contiguous and are available to provide the storage as required for system control, selected device/feature/function support and user programmable storage. Refer to the "IBM 4700 System Configurator", GC31-2017, for a comprehensive list of storage requirements and details on determining if the storage provided will be sufficient.

HIGHLIGHTS

Controls all the functions of 4700 Finance Communication System and/or 3600 Finance Communication System terminals. Controls data transmission via SDLC between those terminals and the central processing site. Host data transmission via SDLC can be at speeds up to 9600 bps dependent on the other elements of the host connection facility. The base controller also offers integrated encryption to provide security of personal identification numbers (PINs), messages and software.

All 4700 system terminals (except 4704-2 and 4704-3) are attached by the loop which operates at speeds of 1200, 2400 or 4800 bps.

The 4701 Model 5 contains approximately 192K bytes of machine storage for use as system control, device/feature/function support and user programmable storage. Refer to the "IBM 4700 System Configurator", GC31-2017, for detailed storage use information. One loop is provided. Houses a direct access diskette drive for one-sided removable diskettes which provides up to 0.25m of diskette storage for control and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). See "Special Features".

System Attachment:

Note: See Program Product pages for host support programming information.

- S/370, 303X, 308X, 3090 or 4300 Processors: Remote attachment using SDLC via a 3704, 3705 or 3725 Communications Controller.
- 4331 Processors Remote or local attachment using SDLC via 4331 Communication Adapter feature.
- 8100 Units (8101, 8130, 8140): Remote attachment or direct connection using SDLC via 8100 unit Data Link features.
- 4341, 4361, 4381, 303X, 308X or 3090 processors: Remote attachment using SDLC via a 3720 Communication Controller.

Each 4701 controller operates in half-duplex mode. Duplex communication line operations are possible with multiple controllers attached to the line, one transmitting, while another receives. The 4701 Model 5 contains a communication adapter without business machine clocking and CCITT V.24/V.28 interface for direct connections or for attaching external modems operating via SDLC at speeds up to 9600 bps. The Data Circuit-terminating Equipment

(DCE) must provide its own clocking. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. See M2700 pages for further information.

Optionally, only when using SDLC, the X.21 Adapter for Switched Networks (#5656) or X.21 Adapter for Nonswitched Networks (#5655) are available in place of the standard CCITT interface. (UK Note: X21 attachment is not available in UK).

The 4701 can be programmed to operate independently when the host processor is unavailable and is capable of controlling all terminal functions, executing arithmetic and capturing data from the terminals for later transmission to the host processor.

Transmission: The 4701 operates over PTT or equivalent customer-owned communication facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating at speeds up to 9600 bps for SDLC links may be used.

Modem	Speed (bps)	Lines
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw or Sw voice grade
3864-1,2	4800/2400	Nonsw or Sw voice grade
3865-1,2	9600/4800	Nonsw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3868-3,4	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw or Sw voice grade
3874	4800	Nonsw voice grade
5811-10	2400 to 9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400 to 9600	Nonsw baseband Rack mount version of 5811-20
5811-28		Nonsw baseband Rack mount version of 5811-20
5812-10	2400 to 9600	Nonsw baseband Rack mount version of 5812-10
5812-18		Nonsw baseband Rack mount version of 5812-10
5865-2,3	9600/7200/9600	Nonsw voice grade Rack mount version of 5865-2
5868-52		Limited distance COAM line
5979-L41	9600	

Note: 4-wire Switched Network Backup is available on 3863, 3864, 3865, 5965 and 5866 modems with feature #7953 installed. 2-wire Switched Network Back-up is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch / TP coordinator for country limitations.

Customer Setup (CSU): The 4701 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, refer to the GI section. One copy of the CSU Instructions is shipped with each 4701.

Customer Responsibilities: The customer must be advised that these responsibilities include:

1. Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.

2. Adequate site, system and other vendor preparation.
3. Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
4. Receipt at the customer's receiving dock, unpacking and placement of the 4701.
5. Performing 4701 checkout in accordance with supplied procedures for initial installation or relocation, and updating of controller diskettes (at customer option).
6. Physical setup, connection of cables in protected customer access areas including loop cables and cable to host communication lines/modems.
7. Installation of the controller data and generation of the operational diskettes, at initial controller installation and for any subsequent controller data support release distribution.
8. Checking communications to the host processor.
9. Using the problem determination procedures provided with the 4701 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to requesting maintenance service (see "Maintenance" below).
10. Determining any required spares.
11. Notifying IBM of intent to relocate and following IBM instructions for relocation.

Maintenance: Maintenance of 4701s is available under IBM Maintenance agreement contracts for on-site maintenance. It is the customer's responsibility to setup the equipment and to determine when maintenance is required.

On-site maintenance is provided during the warranty period.

Customers with 4701s not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) for a time-and-material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement coverage, he may have the machine(s) inspected.

If, on the basis of the inspection, it is concluded that the state of the machine precludes normal maintenance, the machine is returned to the customer without charge.

If the unit requires repair, and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Deferred Central Facility Maintenance (DCFM): Deferred Central Facility Maintenance (DCFM), is available, as an option, under an Amendment to the IBM Maintenance Agreement. DCFM allows for a reduction in the maintenance charge. The customer will provide a facility at which all Machines and/or Workstation Elements covered by a DCFM Amendment will be serviced. The customer will be responsible for determining when remedial maintenance is required and for transporting the Machines and/or Workstation Elements to and from the facility. The minimum quantity of Machines/Workstation Elements requiring remedial maintenance before the customer places a call for such maintenance is as follows:

Cat Units	Quantity
I 4701 Controllers	2
II 4704-1 Control Module)	
II 4704-1 Display Monitors)	6 Category
II 4704-2 Display Module)	II items
II 4704-3 Display Module)	(in any
II 4704 Keyboards)	combina-
II 4710 Printer)	tion)

II 4715 Printer)
II 4720 Printer)

The combination of units in different categories is not allowed.

If the Customer selects to contract DCFM maintenance, IBM recommends spares in a quantity equal to 3% of the customer inventory by device type. The minimum quantity of spares should be equal to the minimum quantity of Machines/Workstation Elements requiring remedial maintenance before the customer places a call for such maintenance.

The customer must provide a service facility with a loop connection and one 4704 Model 1 control module with display monitor and keyboard for maintenance purposes.

Annual maintenance charges apply for on-site and DCFM Maintenance offerings.

Bibliography: For information about 4701 publications, refer to the "4700 System Summary", GC31-2016.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Power (AC, 1-phase): Specify #2999 to identify as Europe order. The 3-digit Country Code of the DP Machine Order Sheet is used to select the power supply which matches the most commonly used power source in each country.

A line cord of 3.0m (9.8 ft) and the country approved plug is provided at the time of shipment.

- Nomenclature:

Danish #2936	German #2929
English #2927	Italian #2932
Finnish #2921	Norwegian #2940
French #2928	Portuguese #2933
French/Dutch	Spanish #2931
Bilingual #2941	Swedish #2925

- Controller Data Support: The selected controller data support is supplied when the controller is shipped. It is the customer's responsibility to install it and any subsequent levels of the data supplied. Encryption capability via the DEA algorithm is included in the data support.

Media distribution of Controller Data, specify one of:

- #9491 (CSU) to identify the initial controller ordered for use with a S/370 or S/370-compatible host system location which requires the host media, or
- #9492 (CSU) to identify additional controllers per S/370 or S/370-compatible host system or for other controllers which do not require the host media.

If #9491 is specified, select the specify number of the desired media:

#9413 9/1600 Magnetic Tape (CSU)
#9414 9/6250 Magnetic Tape (CSU)

If magnetic tape is not available on designated CPU, then the following media may be specified (DOS/VS users only):

#9431 80-column Cards (CSU)

When feature #9491 is specified, and first controller is not in the same location as the host CPU, specify #9496 and supplementary specifications (as comments of the order) are to be entered exactly as follows to indicate shipping address of the host system location:

Line 1 - C/O (Name of customer)
Line 2 - Street Address (or P.O. Box)
Line 3 - City, Country, Postal Code

This is the address to which the initial controller data tape will be automatically shipped for the controller ordered with #9491. Note: Specify code #9491 is used to provide Controller Data Media for only the initial controller attached to a host system location. Do not specify #9491 for more than one controller per host system as this will result in the unnecessary shipment of multiple DTR tapes or cards.

- Cables: In UK, specify #2835 for cabling if used on Datel service.

The following cables will automatically be shipped:

With Feature	Cable Assembly
#2835	#1743584 (0.3m)
#5655 or #5656	#5718197 (6m) and #5718195 (0.3m) Cable Assembly Extender

In all cases, except when feature code #5655 or #5656 is specified, cable assembly #8249921 (6m) will be shipped. See "Accessories" for information on loop cable, also see "4700 Finance Communication System, Installation Planning" (GC31-2018).

SPECIAL FEATURES

X.21 Adapter for Nonswitched Networks (#5655): (Not available in UK) This feature provides an interface and 6 meter cable for attachment to an X.21 native nonswitched network with no changes to existing SNA/SDLC procedures for controlling nonswitched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for non-switched point-to-point and multipoint communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. Limitations: Cannot be installed with #5656. Maximum: One. Field Installation: Not recommended.

X.21 Adapter for Switched Networks (#5656): (Not available in UK) An interface adapter and 6m cable for attachment to the X.21 Switched Network. SDLC Communications at speeds of 2400, 4800 and 9600 bps are supported. Limitations: Cannot be installed with #5655. Field Installation: Not recommended.

MODEL CONVERSIONS

Model changes between model 1 or 2 and 5 are available at time of manufacture only.

ACCESSORIES

Keylock Cable Assembly (P/N 6018769): Replacement keylock cable assembly (used to load Master key) may be purchased from IBM. Order via MES from plant of manufacture.

Cables: IBM shielded twisted-pair is required for attaching 4700 units. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361). For pricing and ordering information, refer to the System Supplies operation within your country.

Other applicable cable assemblies and associated accessories, can be purchased from IBM. See "Physical Planning Manual" (GC31-2018) for cable and connector specifications.

Cable Assembly Number	Use	Length
1743584	Cable Assembly - Datel (UK only)	0.3m (1 ft)
6018886	Cable Assembly - Multi use loop	4.27m (14 ft)
5718197	Cable Assembly - X21	6m (20 ft)
5718195	Cable Extender - X21	0.3m (1 ft)
8249921	Cable Assy, (Inch) - EIA/CCITT	6m (20 ft)

The following are "X" length cables with maximum length shown.

1563155 Loop Cable Assembly 610m (2,000 ft)

For attachment of 3262, 3287, 3278 to a 4701:

Cables: IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. Maximum distance from controller to terminal is 610m (2,000 ft) using shielded twisted-pair cable or 1,500m (4,920 ft) using coaxial cable.

Twisted-pair Cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361). For pricing and ordering information, refer to the System Supplies operation within your country.

Coaxial cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning" (GA27-2787), and "Coaxial Cable and Associated Manual" (GA27-2805).

2577672	Cable Assembly 1,500m (4,920 ft)	- indoor
or		
323921	Coax Wire 1,500m (4,920 ft)	and
1836418	Connector Kit	

Note: Standard length communication cables are automatically shipped with 4701.

GENERAL ACCESSORIES

Filters: Anti-glare filters protect against light reflection and provide either a yellow character display on a brown background (amber) or bright green characters on a dark green background (green). One filter is provided with each 4700 display terminal.

Cradle: The display monitor may be mounted in a cradle to provide a vertical tilt capability which allows the display operator to adjust for the best viewing angle within plus or minus 30 degrees. The cradle may be set on a counter top or be mounted to the under side of a horizontal surface. A bracket supplied for hanging the cradle provides a swivel capability.

Magnetic Stripe Reader: Has read capability only. The MSR is capable of reading the contents of ANSI Track 2 (75 bpi) on a credit or other plastic card.

Dual Density Magnetic Stripe Reader: Has read capability only. This device is capable of reading the contents of ISO Track 2 of a credit or other plastic card, or a magnetic striped savings book encoded at 210 bpi on a 4700 or 3600 encoder.

Magnetic Stripe Reader with Track 3 Read: Has read capability only. This device is capable of reading ISO Track 2 (at 75 bpi) and

Track 3 (at 210 bpi) of credit or ID cards. In addition, the device will read magnetic striped savings books encoded by a 4700 device or according to ISO DP8484 or DIN 32744.

Magnetic Stripe Reader/Encoder: Has read and encode capability. The device is capable of reading the contents of Track 2 on a credit card (encoded at 75 bpi according to the ANSI Standard X4.16) or an ID card or passbook encoded at 210 bpi on a 4704 or 3604, or equivalent. The device encodes at a density of 210 bpi in the IBM Passbook Format. The slot in the unit is designed to accept documents ranging in thickness from 0.25mm (0.010 in.) (excluding magnetic stripe), to 0.84mm (0.033 in.) (including magnetic stripe). It will accept plastic credit cards and ID cards or one cover of a magnetically encoded passbook.

Magnetic Stripe Reader/Encoder with Track 3 Read: Has read and encode capability. The device is capable of reading the contents of ISO track 2 (at 75 bpi) and Track 3 (at 210 bpi) of credit or ID cards. The unit is also capable of reading and encoding a magnetic striped savings book encoded by a 4700 device or according to ISO DP8484 or DIN 32744.

Cleaning Card: A card which is used for cleaning the magnetic head on a Magnetic Stripe Reader.

Encrypting PIN Keypad: A 12-key numeric keypad that has the data encryption algorithm (DEA) implemented in hardware for personal identification number (PIN) encryption within the keypad prior to transmission to a 4704 display terminal.

Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the numeric "0". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the encrypting PIN keypad is ready to accept entry. Data entered from the encrypting PIN keypad is not displayed on the 4704 to which it is attached. Prerequisites: A 4704.

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Non-Encrypting PIN Keypad: A 12-key numeric keypad for entry of a Personal Identification Number (PIN) to a 4704. Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the numeric "0". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the PIN keypad is ready to accept entry. Data entered from the PIN keypad is not displayed on the 4704 to which it is attached. Prerequisites: A 4704.

Note: 4700 non-encrypting PIN keypad and 3600 PIN keypad not interchangeable.

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Encrypting PIN Keypad Privacy Shield: Attaches to the encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Non-Encrypting PIN Keypad Privacy Shield: Attaches to the non-encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the non-encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the non-encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Keypad Protective Caps: Clear plastic caps which cover each non-engraved keypad to protect the label from normal wear and tear. These may be ordered to replace, if required, the ones shipped with the 4704 keyboards.

Keypad Label Sheets: Sheets of 30 labels each for use on the 4704 keypads. The blank sheet contains 30 blank labels. The preprinted sheet contains 16 blank labels and the following preprinted labels: Digits 0 through 9, 00, 000, (. period), and (, comma).

Document Holder: A holder for documents to be fed by the operator into the 4723 document entry slot. The holder is to be placed on the table surface and positioned in front of 4723 where convenient to the customer. It provides added visibility of the documents as well as being convenient when feeding them into the 4723.

ACCESSORY SUMMARY

- Filter, Green (5.5") (P/N 6019525)
- Filter, Green (9.0") (P/N 6019527)
- Filter, Green (5.5") (P/N 6019526)
- Filter, Amber (9.0") (P/N 6019528)
- Cradles, for (5.5") Monitor (#3201, P/N 6019529)
- Cradles, for (9.0") Monitor (#3202, P/N 6019530)
- MSR (Magnetic Stripe Reader) (#4904, P/N 6096847)
- MSR (Magnetic Stripe Reader), Dual Density (#4901, P/N 6019489)
- MSR (Magnetic Stripe Reader), w/ Track 3 Read (#4903, P/N 6096848)
- MSR/E (Magnetic Stripe Reader/Encoder) (#4905, P/N 6096846)
- MSR/E (Magnetic Stripe Reader/Encoder), w/ Track 3 Read (#4907, P/N 6096849)
- Cleaning Card, MSR (#3305, P/N 6019483)
- Encrypting PIN Keypad, German (#3303G0, P/N 5680919)
- Encrypting PIN Keypad, English (#3303U0, P/N 5667650)
- Encrypting PIN Keypad, Dutch (Belgian) (#3303B0, P/N 5680945)
- Encrypting PIN Keypad, Danish (#3303D0, P/N 5680929)
- Encrypting PIN Keypad, French (#3303F0, P/N 5680918)
- Encrypting PIN Keypad, Italian (#3303I0, P/N 5680931)
- Encrypting PIN Keypad, Spanish (#3303T0, P/N 5680930)
- Encrypting PIN Keypad, Swedish (#3303S0, P/N 5680943)
- Non-Encrypting PIN keypad, German (#3301G0, P/N 5680911)
- Non-Encrypting PIN keypad, English (#3301U0, P/N 5680905)
- Non-Encrypting PIN keypad, Dutch (Belgian) (#3301B0, P/N 5680939)
- Non-Encrypting PIN keypad, Danish (#3301D0, P/N 5680914)
- Non-Encrypting PIN keypad, French (#3301F0, P/N 5680917)
- Non-Encrypting PIN keypad, Italian (#3301I0, P/N 5680920)
- Non-Encrypting PIN keypad, Spanish (#3301T0, P/N 5680923)
- Non-Encrypting PIN keypad, Swedish (#3301S0, P/N 5680926)
- Encrypting PIN Privacy Shield, PIN Keypad Shield (#3304, P/N 4707195)
- Keypad Caps, Keypad Protective Cap (one) (#3306, P/N 4585103)
- Keypad Labels, Sheet (blank) (#3307, P/N 6019424)
- Keypad Labels, Sheet (preprinted) (#3308, P/N 6019425)
- Fuses, 5A Slow Blow (100-120V, 50/60 Hz) (P/N 512137)
- Fuses, 3A Slow Blow (200-240V, 50 Hz) (P/N 5718367)
- Document Holder (P/N 4732870)

SUPPLIES

Diskettes: The 4701 uses a standard IBM Diskette 1, or equivalent.

Re-order number: 2305845
Unit of measure: 1 slipcase of 10 diskettes
Minimum order quantity: 10 diskettes
Usable capacity: 284,160 bytes

4702 BRANCH AUTOMATION PROCESSOR

PURPOSE

A programmable processor for attachment of 4700 Finance Communication System terminals and 3600 Finance Communication System terminals to S/370, 303X, 308X, 3090 or 4300 Processors, S/34, S/36, S/38 or 8100 Systems.

MODELS

Model 1 001: A programmable processor with a base configuration of 512K-bytes of machine storage, two Loop adapters or a four-port Cluster Adapter, Host communication adapter, and a 1.2M-byte Diskette Drive which accommodates 5.25 inch high density removable diskettes. May be upgraded to provide terminal attachment via a maximum of six Loops, 32 ports of Cluster Adapter, and five ALA ports. (Some features are mutually exclusive.) May also be upgraded to provide 4.0M-bytes of machine storage, one additional 1.2M-byte Diskette Drive and a maximum of 60M-bytes of internal Fixed Disk Storage capacity. Additional Fixed Disk Storage capacity can be provided with the 4708 Disk Unit Models 5 or 6.

Customer Setup (CSU): The 4702 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, contact IBM. One copy of the CSU Instructions and diagnostic diskette are shipped with each 4702. The CSU allowance is four days.

HIGHLIGHTS

- Controls data transmission between terminals and the central processing site. Host data transmission via RS-232-C interface can be at speeds up to 19,200 bps or via BSC at speeds up to 4800 bps depending on the other elements of the host connection facility. Host data transmission via X.21 and X.25 communications is also supported. A second host interface is supported for SDLC EIA/CCITT, or X.21 non-switched.
- Communication Link Limit information will be found in the "IBM 4700 System Configurator" (GC31-2017) for other host link and ALA options. The base processor also offers data encryption to provide security capability of personal identification numbers (PINs), messages and software.
- Has 512K-bytes of machine storage with 512K-byte or 1.0M-byte additional increments available for a total of 4.0M-bytes. A minimum microcode storage area is required for system control and selected device, feature, or function support. The remainder is available for user-programmable storage. Refer to "IBM 4700 System Configurator" (GC31-2017) for a comprehensive list of storage requirements and details on determining the amount of additional storage, if any, that is required.
- Controls all of the functions of 4700 Finance Communication System and/or 3600 Finance Communication System terminals. All 4700 system terminals (except 4704-2 and 4704-3) are attached by Loops which may be selected to operate at speeds of 1200, 2400 or 4800 bps. The 4702 can have two Loops in the base with two optional features providing a maximum of six Loops. A four port Cluster Adapter may be specified in place of the two Loops in the base machine.
- Houses a 1.2M-byte Diskette Drive for 5.25 inch high density removable diskettes for storage of processor data and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). One additional 1.2M-byte Diskette Drive may be featured. Also, a maximum capacity of 60M-bytes of fixed disk storage (Maximum two disk drives) may be featured internally for temporary and permanent storage of user data. Additional fixed disk storage capacity can be provided via the 4708 Disk Unit Models 5 and/or 6.

- Optional Cluster Adapter feature and Fan-Out Cluster Adapter features are available to provide high-speed workstation attachment locally for 3178 mdl C1, C2, 3180 mdl 1, 3278 mdl 2, 5, 52, 3279 mdl 2A, S2A, 2B, S2B, 02X, 4704 mdl 2, 3 Displays, 5210 mdl G01, G02 Printwheel Printers, 3287 mdl 1, 2 and 3283 mdl 52 Character Printers, 3262 mdl 3, 13 Line Printers, (Canada Only) >5150 or 5160 XT Personal Computer, (<) and 6580 Displaywriter System.
- Optional ALA Communications Ports with either EIA/CCITT interface, Fan-Out Communications interface, or X.21 non-switched interface are available to attach 3624 ATM and/or 4730 Personal Banking Machines. (See ALA Interface Specify Section.)

Streaming Tape Attachment Features: Attaches the Streaming Tape Drive (#6157) to the 4702 Processor. The Streaming Tape Attachment Features when used with the Streaming Tape Drive provides high speed save/restore capability for 30MB 5-1/4 inch hard file in the 4702 Processor. It is recommended that streaming tape operation (Save/Restore) be done during non-operational periods because of the following:

- A disk being saved/restored to/from a streaming tape, CAN NOT BE USED by any application program for the duration of the streaming operation.
- References to other DASD devices will take significantly longer than normal during a streaming operation. See related product documentation for details.

(See Non-Communication Features section.)

Customer Responsibilities: All customers must be advised that their responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
- Receipt at the customer's receiving dock, unpacking and set-up of the unit.
- Performing 4702 checkout in accordance with supplied procedures for initial installation or relocation, and updating of processor diskettes (at customer option).
- Physical setup, connection of cables in protected customer access areas including loop cables, cable to host communication lines/modems, and cables for Disk Storage features.
- Installation of the processor data support and generation of the operational diskettes at initial processor installation and for any subsequent release distribution.
- Checking communications to the host processor.
- Security for erasure of data from a failing fixed disk storage feature being returned to IBM. It is IBM's practice to erase any remaining data on a returned disk before reusing it.
- Using the problem determination procedures provided with the 4702 to determine the failing element and filling out the appropriate 4700 Problem Report prior to forwarding the failing element to an IBM designated location or requesting IBM Service (see "Maintenance" below).
- Determining the need for any required spares.
- Follow IBM instructions regarding relocation.

Publications: For information on 4700 publications, refer to the "4700 System Summary" (GC31-2016).

System Attachment

Note: See Program Product pages for host support programming information.

S/370, 303X, 308X, 3090 or 43XX Processors: Remote attachment using SDLC or BSC-3 via a 3704, 3705 or 3725 Communications Processor. The X.21 adapter for non-switched network, or switched network, and X.25 adapter are available in place of the standard EIA/CCITT interface. See Host Communication Specify Section. The maximum speed supported is 9600 bps for 3704 and 3705, and 19,200 bps for the 3725.

43XX Processors: Local attachment via the Local Attachment feature on the 43XX or remote attachment via the Communication Adapter on the 43XX requires specify #9639 for SDLC or specify #9640 for BSC-3. The maximum speed supported is 9600 bps.

8100 System: Remote attachment or direct connection using SDLC via 8100 unit Data Link features. The maximum speed supported is 9600 bps. These attachments are supported by the DPPX/DSC capability.

S/34 or S/36 Processors: Remote attachment or local attachment using SDLC via S/34 or S/36 Communication Adapter feature. The maximum speed supported is 9600 bps.

S/38 Processors: Remote attachment using SNA/SDLC via S/38 Communication Attachment.

Note: See IBM for a list of applicable PRPQs.

Each 4702 operates in half-duplex mode. When operating in an SNA environment, duplex communication line operations are possible (except S/34 or S/36) with multiple 4702s attached to the line, one 4702 transmitting, while another receives. The 4702 contains a communication adapter without business machine clocking and CCITT V.24/V.28 interface for direct connections or for attaching external modems operating at speeds up to 19,200 bps or BSC-3 with optional BSC Communications specify #9640 at speeds up to 4800 bps. The Data Circuit Terminating Equipment (DCE) must provide its own clocking.

The 4702 can be programmed to operate independently when the host processor is unavailable. It is also capable of controlling all terminal functions, executing arithmetic and capturing data from the terminals for later transmission to the host processor.

When used either with a non-S/370 compatible host system or without a host system, the Local Configuration Facility (LCF) may be ordered. See Controller Data Support Specify Section.

Transmission: The 4702 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating at speeds from 1200 bps to 19,200 bps for RS-232-C links or 4800 bps for BSC-3 links may be used. External modems capable of supplying data clocking such as 386X, 387X, 383X, 586X, 581X, and 5821 are required. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. See M2700 pages for further information.

Maintenance: IBM On-Site Exchange warranty service is included in the purchase price of the machine and is provided under the Agreement for Purchase of IBM Machines and Amendment for IBM Service/Exchange Center Service.

Maintenance service is available under the IBM Maintenance Agreement (Z125-3275) and the Amendment for IBM Service/Exchange Center Service (Z125-3385). The 4702 has two service offerings: IBM On-Site Exchange and Customer Carry-In Exchange. Service offerings may vary by Country. Alternate service offerings may be available in some countries. The repair of defective elements not covered by warranty or a maintenance agreement is only provided at the IBM Repair Center on an hourly service basis. If the 4702 is not covered by an IBM Maintenance Agreement, IBM Hourly Service is available at the customer site.

It is the customer's responsibility to setup the equipment and to determine when maintenance is required. If the customer has Customer Carry-In Exchange, it is the customer's responsibility to disconnect the element, transport it to the designated IBM location, and exchange the element for a new one.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage: Specify #2998. Specify codes may not be required when ordering a 4702. If no code is specified the appropriate default will be assumed based on the three-digit country code. Default countries are shown below:

Argentina	New Zealand
Australia	Sri Lanka
Chile	Uruguay

All of the above will be shipped with 220/240V AC, 50 Hz.

Brazil	Peru
Canada	Philippines
Dominican Republic	South Korea
Ecuador	Taiwan
Japan	Venezuela
Mexico	

All of the above will be shipped with 50/60 Hz, 120V.

For countries not listed above, specify:

50 Hz	60 Hz
100V-110V #9893	100V-120V #9892
200V-240V #9894	

(Canada only > Specify #9890 for locking plug. If not specified a non-locking plug will be provided (for 60 Hz, 120V, 1-phase). <)

(Japan Only > Specify #9890 for locking plug. If not specified a non-locking plug will be provided (for voltages under 200V). <)

(Except Canada and Japan > The 3-digit WT Country Code of the DP Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each country. If an AC power source other than the most common in the country is specified, and it is incompatible with the power plug commonly supplied, no power cord will be shipped unless a country RPQ is initiated. <)

A line cord of 3.0m (9.8 ft) and the country approved plug will be provided at the time of shipment.

- Machine Nomenclature:

The machines will be shipped to countries with the following nomenclature defaults:

Country	Nomenclature
Argentina	Spanish
Australia	English
Brazil	Portuguese
Canada	Canadian/French
Chile	Spanish
Dominican Republic	Spanish
Ecuador	Spanish
Japan	Japanese
Mexico	Spanish
New Zealand	English
Peru	Spanish
Philippines	English
South Korea	English

Sri Lanka	English
Taiwan	English
Uruguay	Spanish
Venezuela	Spanish

If exceptions are required or if none is listed for your country, specify from the following list:

English #2927
Canadian/French Bilingual #2934
Portuguese #2933
Spanish #2931

- Host Communication Interface: These Specify codes may be field converted via an RPQ. Specify one of the following on each order:

SDLC (RS-232-C)	#9639
BSC-3 (RS-232-C)	#9640
X.21 Switched	#9641
X.21 Non-Switched	#9642
X.25 (RS-232-C)	#9643
X.25 Non-Switched	#9644

SDLC or X.25 RS-232-C Communications Without Business Machine Clocking (#9639, #9643): Provides an interface for attachment to either SDLC #9639, or X.25 #9643 Networks.

BSC RS-232-C Communications Without Business Machine Clocking (#9640): Required for attachment to communications lines through an external modem which has internal clocking at speeds up to 4800 bps when operating with Binary Synchronous Communications BSC-3.

X.21 Interface for X.21 Switched or X.21 or X.25 Non-Switched Network (#9641, #9642, #9644): This adapter provides an interface and 6.0m cable for attachment to an X.21 native switched or X.21 or X.25 non-switched network with no changes to existing SNA/SDLC procedures for controlling non-switched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for non-switched point-to-point and multi-point communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. Also provides an interface adapter and six meter cable for attachment to the X.21 Switched Network.

Summary of X.21 and X.25 Networks supported:

	Facility	
X.21	L	Switched Data Network (X series)
X.21	M	Non-Switched Data Network (V series)
X.21	N	Non-Switched Data Network (X series)
X.25	P	Packet Network (P series)
X.25	Q	Packet Network (X series)

Second Host Interface (One Only): These Specify codes may be field installed. Specify one of the following: (Prerequisite is ALA Port #3702)

SDLC (RS-232-C)	#9650 (Only allowed with #9639)
X.21 Non-Switched	#9651 (Only allowed with #9642)

SDLC RS-232-C Interface (#9645): Provides the appropriate cables and interface logic necessary to attach an external modem for communications attachment to remote 4730 Personal Banking Machines via SDLC at speeds up to 9600 bps, or 3624's via SDLC at 2400 bps or 4800 bps. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy.

Fan-Out Communications Interface (#9646): Permits local attachment of up to four 4730 Personal Banking Machines or 3624 ATMs

communicating via SDLC. Prerequisites: #3702 and "X" length cable. Speed switch must be set on the card. Maximum length cable is indicated below.

Speed	Maximum Cable Length
9600 bps	30.48m (100 ft)
4800 bps	60.96m (200 ft)
2400 bps	121.92m (400 ft)

Note: All attached 4730s or 3624s will run at the selected speed. 3624s run at 2400 bps or 4800 bps only.

X.21 Non-Switched Interface (#9647): Provides the appropriate interface for device attachment to the 4702 Controller via an X.21 non-switched Network.

Base Controller Adapter: Specify one of the following on each order:

Two Loop Adapter	#9649
Four Port Cluster Adapter	#9638

The selected controller data support is supplied when the controller is shipped. It is the customer's responsibility to install it and any subsequent levels of the data support supplied. Encryption capability via the DEA algorithm is included in the data support. This encryption capability is not available in Surinam or Hungary.

Ordering Information for 4700 Controller Data: There are three specify codes (#9490, #9491, and #9492) for ordering controller data for the 4700 controllers. These specify codes enable the user to order each controller with the capability of creating operational diskettes wither at a S/370 or S/370-compatible host system and/or at the controller site. When ordering a controller for which it is intended that operational diskettes will be generated at the controller site, use specify code #9490. When ordering the initial controller for a user who intends to generate operational diskettes using a S/370 or S/370 compatible host system, use specify #9491, and when ordering additional controllers use specify code #9492.

Distribution of controller data media, specify #9490, #9491, or #9492 as follows:

Specify #9490 identifies a controller which requires the capability to create operational diskettes at the controller using the Local Configuration Facility (LCF). Three controller data diskettes will be shipped with the controller.

1. Installation Diskette
2. LCF Pre-Operational Diskette
3. LCF Program Diskette

LCF requires a 4704 Display Terminal with the Alphameric Keyboard (#4662) for the necessary dialog between the user and the controller. An Additional 1.2M-byte Diskette Drive (#1046) is also recommended on at least one 4702 per enterprise to do diskette copy for backup or distribution of LCF Operational diskettes to other branch 4702 controllers.

Note: #9490 should be used to provide Controller Data Media for only those controllers that require a system generation facility at the controller. Unnecessary shipment of multiple diskettes will result if specified when not required.

OR

Specify #9491 identifies the initial controller used with a S/370 or S/370 compatible host system location. The user will receive a DTR tape delivered to the address described below and an installation diskette included with the controller.

Note: Do not specify #9491 for more than one controller per host system as this will result in the unnecessary shipment of multiple DTR tapes.

If #9491 is specified, select the specify code of the desired media.

#9413	9/1600 Magnetic Tape (CSU)
#9414	9/6250 Magnetic Tape (CSU)

Specify #9492 is used to order additional controllers when neither a DTR nor a pre-operational diskette is required, or when operational diskette creation is not required.

Any time #9490 or #9491 is specified, enter supplementary specifications (via AAS order entry) exactly as follows to indicate shipping address of the Host System Location. Specify #9490 or #9491 must be specified as first controller and the supplemental address completed. Do not specify #9492 for all controllers for a single customer.

Line 1 - C/O (Name of customer)
Line 2 - Street Address (or P.O. Box)
Line 3 - City, Country, Postal Code.

This is the address to which the initial controller data tape will automatically be shipped.

Cables: See "Accessories" for additional information. See also "4700 Finance Communication System, Installation Planning Manual" (GC31-2018).

The following cable assembly will automatically be shipped:

Feature/Specify	With Cable Assembly
#2835	#1743584 (0.3m)
#9641, #9642	
#9644, #9651	#6423155 (6.0m) and #6423322 (0.3m) Cable assembly extender
#9639, #9640, #9643, #9645, #9650	#6423153 (6.0m) or #6423153 (6.0m) with metric screws

SPECIAL FEATURES

Note: Unless otherwise stated, all features available for field installation are customer installable, and consequently there is no charge for removal.

Non-Communications Features

The 4702 has a maximum of four card locations available for 512K-byte or 1.0M-byte additional machine storage features. The maximum machine storage capacity including the 512K-bytes in the base is limited to 4.0M-bytes. The maximum machine storage of 4.0M-bytes cannot be achieved by populating the four card locations with 512K-byte storage features.

512K-Byte Storage (#1011): Provides an additional 512K-bytes of machine storage. Limitation: The combination of features #1011, #1012 cannot exceed four. Maximum: Four. Field Installation: Yes.

1.0M Byte Storage (#1012): Provides an additional 1.0M-bytes of machine storage. Limitation: The combination of features #1011, #1012 cannot exceed four. Maximum: Three. Field Installation: Yes.

1.2M-Byte Diskette Drive (#1046): Provides approximately 1.2M-bytes of additional diskette storage via a second diskette drive for high density diskettes. Maximum: One. Field Installation: Yes.

30M-Byte Disk Drive (#1085): Provides 30 M-bytes of fixed disk storage. Maximum: Two. Limitations: One or two #1085s. Field Installation: Yes.

Cluster Adapter (#3102): Provides four ports for the local attachment of up to four devices with a mix of 3262 mdl 3, 13 Line Printers, 3178 mdls C1, C2, 3180 mdl 1, 3191 Mdl A1X, B1X, 3278 mdl 2, 5 (Japan Only>, 52<) Display Stations, 3279 mdl 2A, S2A, 2B, S2B, 02X, 4704 mdl 2, 3 Display Stations, (Japan Only> 3283 mdl 52, <) (Canada Only> 5150 or 5160 XT Personal Computer, <) 5210 mdls

G01, G02 Printwheel Printers, and 3287 mdl 1, 2 Printers, 6580 Displaywriter System. When attaching the 3180 mdl 1 Display Station, only the 1,920 and 3,564 character screen sizes are supported. The 4702 does not support all 3180 functions. When attaching the 3278 mdl 2 Display Station to the device cluster adapter, no-charge 3278 RPQ 8K0880 is required. (Japan Only> When attaching the 3278 Display Station mdl 52 to the Device Cluster Adapter, no-charge 3278 RPQ 7F0148 is required.<) When attaching Displaywriter via the 3278 emulation adapter, file transfer is not supported on the 4702. See M6580 (Canada Only>, 5150 or 5160<) pages for additional prerequisites and/or limitations. Limitations: Maximum distance from processor to terminal is 1,500 meters (4,920 ft). The 5210 printer is supported in SCS mode only. Cannot be ordered if specify #9638. The combination of #3102, #3103, #4746, and #3702 cannot exceed ten. Maximum: One. Field Installation: Yes.

Fan-Out Cluster Adapter (#3103): Provides eight ports for the local attachment of up to eight Cluster Adapter terminals. Limitations: Attaches to one #3102 or #9638 port (net increase of seven ports). The combination of #3102, #3103, #3702, and #4746 cannot exceed ten. Maximum: Four. Field Installation: Yes. Prerequisites: #3102 or #9638.

Disk Unit Redrive Adapter (#3703): Provides the attachment capability for one 4708 Disk Unit models 5 or 6. Maximum: One. Limitation: The 4702 can not IPL via this adapter. Field Installation: Yes.

6157 Attachment Feature (#3733): Provides the attachment feature in the 4702 Processor. Maximum: One. Field Installation: Yes. These features are field installable via RPQs.

Attachment Feature and Switch Function (#3734): Provides the attachment feature and switch function in a 4708 Disk Unit to attach the 6157 to a 4702 Processor and 4708 Disk Unit or attach a 6157 to dual 4708s.

Loop Adapter (#4746) p.Each adapter provides two additional loop attachments of 4700 Finance Communication System or 3600 Finance Communication System Terminals. Limitation: The combination of #3102, #3103, #3702, and #4746 cannot exceed ten. Maximum: Two, providing four additional loops for a total of six. Field Installation: Yes.

ALA Communication Features

ALA Port (#3702): Required to communicate with local or remote 4730 Personal Banking Machines at speeds from 1200 bps to 9600 bps, or 3624 ATMs at speeds of 2400 bps or 4800 bps. Also required for Second Host Interface. Limitation: The combination of #3102, #3103, #3702 and #4746 cannot exceed ten. Maximum: Five. Field Installation: Yes. Specify: See specify section for second host interface or ALA interface specifies.

ACCESSORIES

Keylock Cable Assembly: Replacement keylock cable assembly (used to load Master key) may be purchased from IBM. Order via MES from plant of manufacture Order P/N 6328560.

Cables: Shielded twisted-pair cable is available for attaching 4700 terminals to the 4702 controller in a loop configuration. The loop can be implemented using the IBM Cabling System or banking loop cable. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories.

IBM Cabling System: For proper identification, installation, and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361). For pricing and ordering information, refer to the System Supplies operation within your country.

Banking Loop Cable: For proper identification, installation, and application of cable and associated accessories, refer to "4700 Finance Communication System - Installation Planning Manual" (GC31-2018).

Note: For each Loop Adapter card (either base or feature) two 1.8m cables (P/N 6167476) will be shipped.

The following is "X" length cable with maximum length shown:

1563155: Loop Cable Assembly - 610m (2,000 ft)

IBM shielded twisted-pair cable (or equivalent) or coaxial cable is required for product attachment. Cable and associated accessories can be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of the cable and associated accessories. maximum distance from controller to terminal is 610m (2,000 ft) using shielded twisted-pair cable or 1,500m (4,290 ft) using coaxial cable.

Twisted-Pair Cable: For proper identification, installation and application of cable and associated accessories, refer to "IBM Cabling System - Planning and Installation Guide" (GA27-3361). For pricing and ordering information, refer to the System Supplies operation within your country.

Coaxial Cable: For proper identification, installation, and application of cable and associated accessories, refer to "IBM 3270 Installation Manual - Physical Planning" (GA27-2787) and "Coaxial Cable and Associated Manual" (GA27-2805).

Loop Repeater (P/N 4400002): Plugs into the loop cable and re-drives all signals being transmitted in a 3600 or 4700 Finance Communication System. Each Loop Repeater contains loop redriving capabilities which allow for the extension of the loop cable length by 2,000 feet. Loop Repeaters may be employed on a loop to extend its overall length to a maximum of 20,000 cable-feet. The unit can be physically mounted on a wall in an out-of-the-way location. Pre-

requisites: An operating 4700 System Local Loop or Remote Sub-Loop. For Ordering: See IBM.

	Machine	P/N
Loop Repeater	4701	4400002
Loop Repeater	4702	4400002

GENERAL ACCESSORIES

Information regarding Accessories for other IBM 4700 Finance Communication System machine types such as 4704, 4710, and 4720, can be found in their respective sales pages.

4704 FINANCE COMMUNICATION DISPLAY STATION

PURPOSE

A modular user-configurable 480 or 1,920 character CRT display and keyboard station for input and output in interactive banking applications.

Three display models with a variety of keyboards provide flexibility to offer a wide range of display functions and keyboard configurations.

MODELS 1, 2, 3

Model 001: A loop-attached keyboard display for use in interactive banking applications.

Model 002: A DCA-attached keyboard display with 9" CRT for use in interactive banking or administrative applications.

Model 003: A DCA-attached keyboard display with 12" CRT for use in interactive banking or administrative applications.

Prerequisites

Model 1: An available position on a loop of a 4700 Finance Communication System or 3600 Finance Communication System. One Display Monitor and filter, and one keyboard type must be selected to complete the order (see "Special Features"), unless the unit is being ordered for use as a spare and then the specify for the Display Control Module only, must be indicated (see "Specify").

Model 2 or 3: An available position on the 4700 DCA feature. One filter and one keyboard type must be selected to complete the order (see "Special Features"), unless the unit is being ordered as a spare and then the specify for the Display Module must be indicated (see "Specify").

Customer Setup (CSU): Machine and selected features.

HIGHLIGHTS

Model 1: A basic display station consists of a Display Control Module, a Display Monitor (5.5" or 9") with filter and a Keyboard. The Display Control Module provides capability to attach to the 4700 or 3600 System Controller via a loop connection.

Model 2 or 3: A basic display station consists of a Display Module with filter and a keyboard. The Display Module provides capability to attach to the 4700 System Controller via a DCA connection and offers improved performance for administrative applications. (Additional information under "Special Features".)

Model 1, 2 and 3: A magnetics device and a PIN keypad (see "Accessories") may be optionally attached to the Display Control Module (mdl 1) or the Display Module (mdl 2 and 3).

The characters are well defined. Brightness and contrast are adjustable.

Automatic initiation of diagnostics begins when station is powered on.

Four different keyboards are available to meet various user and application requirements (see "Special Features").

Additional standard display station functions include:

- Upper- and lowercase characters
- Normal- and high-intensity
- MSR, MSR/E and PIN Keypad attachment capability
- Audible alarm
- 3604 Compatibility
- Banking Loop communication (mdl 1)

- Address sharing with printers (mdl 1)
- 3278-2 Compatibility (except magnetics) (mdl 2 and 3 only)
- DCA Communication (mdl 2 and 3 only)

Risers on the mdl 1 and 2 displays, and a pedestal on the mdl 3 that attach to the bottom of the Displays and keyboard, tilt the front of the display, or the rear of the keyboard, upward approximately 15 degrees. An optional cradle (mdl 1 and 2 only) enables the operator to adjust the viewing angle of the display from (-5 degrees to +20 degrees). A choice of anti-glare filters protect against light reflection. The anti-glare filters provide either yellow characters displayed on a brown background or bright green characters on a dark green background (see "Accessories"). One filter is provided with (and must be specified) for each display station.

Customer Setup (CSU): The 4704 is designated customer setup, thereby offering the customer early availability and station relocation flexibility. One copy of the CSU Instructions is shipped with each 4704.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4704.
- Performing 4704 checkout in accordance with IBM-supplied procedures for initial installation or relocation.
- Physical setup, connection of cables in protected customer access areas including loop cables (mdl 1), DCA cables (mdl 2 and 3), cables that attach the Display Control Module to the Display Monitor (mdl 1), and cables that attach keyboards, magnetics and PIN keypads to the Display Control Module (mdl 1) or Display Module (mdl 2 and 3).
- Using problem determination procedures provided with the 4704 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM Service/Exchange Center, or calling IBM if on-site exchange service is required. (See "Maintenance" below.)
- Determining any required spares.

Display Monitors: (Mdl 1) The Display Monitors are free-standing units which are cable attached to the Display Control Module. One Display Monitor must be selected for each Display Control Module. Only one Display Monitor may be attached to a 4704 Display Control Module. For spares, any number of Display Monitors may be ordered depending on user requirements.

Display Modules: (Mdl 2, 3) The Display Module is an integrated unit which contains a CRT plus the logic and power necessary to drive the CRT, keyboard and the optional magnetics and/or PIN keypad devices. One keyboard or keyboard combination must be selected for each Display Module. The Display Module will display, under program control, either 1,920 characters (24 lines of 80 characters each) or 480 characters (12 lines of 40 each). In the 480-character mode, the characters are larger than in the 1,920-character mode. Limitations: Not attachable to a 3600 System Controller. Customer Setup: Yes. Specify: One of the following must be selected for each Display Module: #9183 Anti-glare Filter (Green) or #9193 Anti-glare Filter (Amber) for mdl 2. #9184 Anti-glare Filter (Green) or #9194 Anti-glare Filter (Amber) for mdl 3.

Keyboards: The keyboards are packaged separately from the display, with a cable for attachment to the Display Control Module or Display Module. The Function, Expanded Alphanumeric and Administrative keyboards have a combination of pre-engraved and non-engraved keytops. These keyboards are provided with a set of keytop labels, some of which contain pre-printed numbers and the

remainder blank. The clear plastic cap which covers each non-engraved keytop protects the label from wear. One keyboard must be selected for each Display. Only one keyboard or keyboard combination may be attached to a 4704 Display Station. For spares, any number of keyboards may be ordered depending on user requirements.

Publications: For information on 4704 publications, refer to the "IBM 4700 Finance Communication System: Introduction to the IBM 4704 Model 2 and 3 Display Station" (GC31-2049).

SPECIFY

Unless indicated otherwise, these specify features are not recommended for field installation.

- Power (AC, 1-phase): Specify #2998, then select one of the following:

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	120V #9911
220V #2813	
230V #2821	
240V #2801	

A line cord of 3m (9.8 ft) and the country-approved plug will be provided at the time of shipment.

- Plugs:

(Canada only> Specify #9890 for locking plug, #9891 for non-locking plug (for 60 Hz, 120V, 1-phase).<)

(Japan only> Specify #9890 for locking plug, #9891 for non-locking plug (for voltages under 200 Volts).<)

(Except Canada and Japan> The 3-digit Country Code of the Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each country. If an exception to the above is required, a Country RPQ may be initiated.<)

Note: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug will be shipped unless the Country RPQ referenced above is initiated.

- Cables: For DCA attachment, refer to "Accessories" section of M4701 pages for ordering information. The following cables are provided:

Model 1 - Attached to the Display Control Module are the cables for the Display Monitor attachment and the loop attachment.

Model 1 and 2 - The keyboards, magnetics, and PIN keypads provide a cable for attachment to the Display Control Module or Display Module. All cables are 2.0m (6.5 ft) long. For more information, see "IBM 4700 Finance Communication System: Installation Planning Manual", GC31-2018.

- Nomenclature:

Canadian French Bilingual	#2934
English	#2927
Japanese	#2930
Spanish	#2931

- Keyboard Language Groups: Specify one.

Canadian French	#2977
EBCDIC	#2951
International	#2950
Japanese English	#2955
Japanese Katakana	#2973
Spanish Speaking	#2969

UK
US

#2958
#2956

- Display Control Module or Display Module: Specify #9480 when ordering mdl 1 without Display Monitor or Keyboard, or mdl 2 or 3 without Keyboard.

SPECIAL FEATURES

Note: When ordering special features via MES, the number of devices which may be on a single order is a maximum of 25.

Display Monitor (5.5 in.) (#3255): Mdl 1 displays up to 480 characters in 12 lines of 40 characters each on a 5.5-inch (diagonal) CRT. Limitations: Cannot be installed with #3290. Customer Setup: Yes. Specify: One of the following must be selected for each #3255 Display Monitor: #9181 Anti-glare filter (green) or #9191 Anti-glare filter (amber).

Display Monitor (9 in.) (#3290): Mdl 1 displays, under program control, either 1,920 characters (24 lines of 80 each) or 480 characters (12 lines of 40 each) on a 9-inch (diagonal) CRT. In the 480-character mode (default mode), the characters are larger than in the 1,920-character mode. Limitations: Cannot be installed with #3255. Customer Setup: Yes. Specify: One of the following must be selected for each #3290 Display Monitor: #9182 Anti-glare (green) or #9192 Anti-glare filter (amber).

Administrative Keyboard (#4607): A 107-Key keyboard with a permanently labeled typewriter layout of 62 keys plus a cluster of 10 control keys to the left of the alphameric block, a cluster of 15 keys to the right of the alphameric block and a cluster of 20 keys to the right of the 15-key cluster. Two of the keys in the 10-key cluster are permanently labeled; the remaining eight keys plus the entire 15- and 20-key clusters are programmable and may be labeled according to the application requirements. Limitations: (1) May not be combined with a Function Keyboard (#4650), an Alphameric Keyboard (#4662) or an Expanded Alphameric Keyboard (Except Canada and New Zealand> (#4677).<) (2) Attaches to 4704 mdls 2 and 3 and IBM Personal Computer and IBM Personal Computer XT with Financial Input Adapter (#6049) only. (Canada and New Zealand only> Attaches to 4704 mdls 2 and 3 and mdls 1 built after May, 1983 which indicate ROS EC level 01 or above.<) (3) This keyboard is not supported on 3600 System Controllers. Customer Setup: Yes.

Function Keyboard (#4650): A 50-key keyboard containing two clusters of 15 keys (a matrix of five rows, with three keys in each row) plus one cluster of 20 keys (a matrix of five rows, with four keys in each row) to the right side of the keyboard. 45 of these keys are non-engraved and may be personalized by the user according to requirements. The remaining five keys are pre-engraved. This keyboard may be combined with Alphameric Keyboard (#4662) for additional function. May be combined with Expanded Alphameric Keyboard (#4677) if attached to IBM Personal Computer or IBM Personal Computer XT with Financial Input Adapter. Limitations: May not be combined with Expanded Alphameric Keyboard (#4677) or Administrative Keyboard (#4607) on a 4704. Customer Setup: Yes.

Alphameric Keyboard (#4662): A 62-key alphameric keyboard. It provides a typewriter layout with permanently labeled keys. This keyboard may be combined with Function Keyboard (#4650) for additional function. Limitations: May not be combined with an Expanded Alphameric Keyboard (#4677) or Administrative Keyboard (#4607). Customer Setup: Yes.

Expanded Alphameric Keyboard (#4677): A 77-key Keyboard with a permanently labeled typewriter layout of 62 keys plus a cluster of 15 non-engraved function keys to the right of the alphameric block. The 15 function keys are programmable and can be labeled according to the application requirements. Limitations: May not be combined with a Function Keyboard on a 4704. May be combined with a Function Keyboard if attached to IBM Personal Computer or IBM Personal Computer XT with Financial Input Adapter (#6049). Customer Setup: Yes.

MACHINES

MODEL CONVERSIONS (NONE)

ACCESSORIES

The following items are available on a purchase-only basis. Order by feature number with original machine order for delivery of the item with the 4704. Order the item on Part Supplies Requisition for delivery at any other time.

Filters: Anti-glare filters will protect against light reflection and provide either a yellow character display on a brown background (amber) or bright green characters on a dark green background (green). (One filter is provided with each display station.) One filter must be selected for each display monitor feature (see "Special Features").

P/N	Filter Description
6019538	Green (5.5 in.) Mdl 1
6019539	Green (9.0 in.) Mdl 1
6019533	Amber (5.5 in.) Mdl 1
6019536	Amber (9.0 in.) Mdl 1
8583479	Green (9.0 in.) Mdl 2
8583480	Amber (9.0 in.) Mdl 2
8583444	Green (12.0 in.) Mdl 3
8583445	Amber (12.0 in.) Mdl 3

Cradle: A vertical tilt capability allows the display operator to adjust the display monitor from -5 to plus 20 degrees, (mdls 1 and 2 only). The cradle may be set on a counter top or for mdl 1 only may be mounted to the underside of a horizontal surface. A bracket supplied for hanging the cradle provides a swivel capability.

P/N	Description
6019529	Cradle (5.5 in.)
6019530	Cradle (9.0 in.)

Magnetic Stripe Reader: Specify #4904 for delivery of the unit with the 4704. Order P/N 6096847 for delivery of the unit any other time. Has read capability only. The MSR is capable of reading the contents of ANSI Track 2 (75 bpi) on a credit or other plastic card.

Limitations: Cannot be installed with Magnetic Stripe Reader/Encoder. Maximum: One.

Magnetic Stripe Reader: Specify #4901 for delivery of the unit with the 4704. Order P/N 6019489 for delivery of the unit at any other time. The MSR is capable of reading both the contents of ANSI or ISO Track 2 (75 bpi) on a credit or other plastic card and the contents of a track encoded on a magnetic striped savings book by a 4704 or 3604 magnetic stripe encoder (210 bpi). When attached to a 4704 mdl 1, the MSR is also capable of reading the contents of a track encoded at 210 bpi in accordance with JUCC specifications. The slot in the device is designed to accept documents ranging in thickness from 0.25mm (0.010 in.) to 2.44mm (0.096 in.).

Limitations: Cannot be installed with Magnetic Stripe Reader/Encoder. Maximum: One.

Magnetic Stripe Reader/Encoder: Specify #4905 (P/N 6096846) for delivery of the unit with the 4704 --- P/N 6096846 for delivery of the unit any other time. Has read and encode capability. The device is capable of reading the contents of Track 2 on a credit card (encoded at 75 bpi according to the ANSI Standard X4.16) or an ID card or passbook encoded at 210 bpi on another magnetic stripe encoder attached to a 4704 or 3604, or equivalent. When attached to a 4704 mdl 1, the Magnetic Stripe Reader/Encoder is also capable of reading the contents of a track encoded at 210 bpi in accordance with JUCC specifications. The device encodes at 210 bpi in the 3604 Passbook Format. The slot in the device is designed to accept documents ranging in thickness from 0.25mm (0.010") (excluding magnetic stripe), to 0.96mm (0.038") (including magnetic stripe). It will accept plastic credit cards and ID cards or one cover of a magnetically encoded passbook. **Limitations:** Cannot be installed with Magnetic Stripe Reader. Maximum: One. Customer Responsibility:

ities: The customer must be advised that: The customer is responsible for obtaining the appropriate number of spare magnetic stripe devices --- the customer is responsible for determining the failing unit.

Warranty: Magnetic stripe readers and reader/encoders are not maintained by IBM under the normal lease agreement or MMMC for purchased machines.

Cleaning Card (P/N 6019483): A card which is used for cleaning the magnetic head on a Magnetic Stripe Reader.

Encrypting PIN Keypad: A cable attached encrypting PIN keypad device enabling the customer to enter a personal identification number that becomes encrypted during a transaction. **Limitations:** Cannot be installed with a Non-Encrypting PIN Keypad. Maximum: One.

P/N	Description
5667650	English
5680930	Latin American Spanish
5680918	Canadian French
5680944	Japanese

Non-Encrypting PIN Keypad: A cable attached non-encrypting PIN keypad device enabling the customer to enter a personal identification number during a transaction.

P/N	Description
5680905	English
5680923	Latin America Spanish
5680932	Canadian French
5680935	Japanese

PIN Keypad Privacy Shield: Provides a degree of visual shielding while allowing easy manipulation of the PIN keypad keys.

P/N	Description
4707195	Shield

Keypad Protective Caps: Clear plastic caps which cover non-engraved keytops to protect the label from wear.

P/N	Description
4585103	Keypad Cap

Keypad Label Sheets: Labels which provide the user with some pre-printed numbers and/or blanks for users requirements.

P/N	Description
8248324	Blank Labels
8248318	Labels Pre-printed with numbers
8248319	Labels Pre-printed with function keys

Fuses:	
512137	(5A Slow Blow) -(100-120V, 50/60 Hz)
5718367	(3A Slow Blow) -(200-240V, 50 Hz)

New

IBM 4706 DOCUMENT CODELINE AND MAGNETIC STRIPE READER

PURPOSE

A slot reader for 4704 Display Stations and the 4700 Personal Computer that optically reads the encoding line on checks and other documents and magnetically reads an encoded stripe on a plastic card or passbook.

The 4706 is comprised of two units. One unit is the slot reader, which would be located on a countertop or desk. A separate power unit is designed to be placed off the work area to conserve space.

MODELS

Model 1 001 The Model 1 is capable of reading the contents of ANSI or ISO track 2 (75 bpi) and the contents of track 2 encoded at 210 bpi.

Prerequisites: An available magnetics port on a 4704 or a 4700 Personal Computer and an available electrical outlet. The power unit connects to the port via its integral cable and to the electrical outlet via its linecord. The slot reader connects to the power unit via its integral cable.

Customer Setup (CSU): The 4706 is designated customer setup, thereby offering the customer early availability and relocation flexibility. A copy of the manual, IBM 4706 Setup and Operating Instructions (GC31-2585), is shipped with each 4706.

HIGHLIGHTS

- Eliminates the need for operator keying of data that is contained in the encoding line of a document or the magnetic stripe of a plastic card or passbook. After the document or card is read, the operator completes the transaction by keying any other required fields. The entire transaction is thus captured electronically as a by-product of document handling.
- Attaches to all models of the 4704 display station and the 4700 Personal Computer via the magnetics port.
- Optically reads the encoding line on checks or other documents encoded in E13B, OCR-A, OCR-B, or CMC-7 with automatic font determination.
- The OCR head is capable of reading a mixed font encoded line which begins in OCR-B font and switches to E13B font when the special font switch character is encountered.
- Capable of reading the contents of ANSI or ISO track 2 (75 bpi) and the contents of track 2 encoded at 210 bpi.
- When attached to a 4704 mdl 1, the 4706 is capable of reading the contents of track 2 encoded at 210 bpi in accordance with JUCC specifications.
- Separate power unit requires no space at the workstation. It is equipped with a bracket for mounting the unit on a vertical surface underneath the countertop or desk.
- Small footprint of the reader requires minimal space at the workstation. The operator can also position the device for optimum comfort and convenience.
- Device status is easily determined by three indicator lights: ready, processing and rescan.

Customer Responsibilities:

Customers must be advised that their responsibilities include:

Assuring that the use of the equipment complies with all national, regional and local laws, regulations and ordinances.

Adequate site, system and other vendor preparation.

Determining any required spares.

Receipt at the customer's receiving dock, unpacking and placement of the 4706.

Performing 4706 checkout in accordance with IBM-supplied procedures and for initial installation or relocation.

Physical setup and connection of cables in protected customer access areas. This includes the cable that attaches the slot reader to its power unit and the cable that attaches the power unit to the magnetics port of its host 4704 or 4700 Personal Computer.

Using problem determination procedures provided with the 4706 to determine the failing unit and filling out the appropriate 4700 Problem

Report prior to forwarding the failing unit to an IBM designated location.

MAINTENANCE AND WARRANTY SERVICES

Warranty Service: The warranty period is one year following the date of installation.

Maintenance is provided during the warranty period as described in the Customer Carry-In Repair option of the IBM Service/Exchange Center's Maintenance plan, except when a Warranty Option plan is in effect. (See the machines "Terms and Conditions" section of the sales manual for description of the warranty options.)

Note: Not all Warranty Option plans are available in each country. Contact the country Service Department for available options and applicable terms and conditions in your country.

Maintenance Services: The 4706 utilizes IBM Service/Exchange Centers under the following options:

- Customer Carry-In Exchange (CCE)
- Customer Carry-In Repair (CCR)

See GI section, CE services subsection, for description and procedures associated with service centers.

SPECIFY

Unless indicated otherwise, the following specify codes are available only at time of manufacture.

(Except Canada and Japan+)

- Power: Specify #2998, then select one of the following:

50 Hz

100V to 110V #9893

200V to 240V #9894

60 Hz

100V to 120V #9892

- Power Plugs: The three-digit WT country code of the ISG Machine Order Sheet is used to select a power plug that matches the most commonly used power supply in each country. If an exception to the above is required, a Country RPQ may be initiated.

- Power Plugs and Line Cords: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug is shipped unless the Country RPQ referenced above is initiated. +)

(Canada and Japan only+)

- Power (120V AC, 60 Hz): Specify #2998 only.

- Power Plugs: Specify #9890 for a locking plug. If not specified, the order will default to a nonlocking plug. +)

- Machine Nomenclature:

Canadian-French

Bilingual #2934

English #2927

Japanese #2930

Spanish #2931

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

4708 DISK UNIT

PURPOSE

Provides disk storage for the 4701 Model 3 (Model 5 only) Finance Communication Controller and the 4702 Branch Automation Processor (Models 5 and 6).

MODELS

Model 1 001: (NO LONGER AVAILABLE) A disk unit with one disk drive having a formatted capacity of 72M-bytes.

Model 2 002: (NO LONGER AVAILABLE) A disk unit with two disk drives having formatted capacities of 72M-bytes each.

Model 3 003: (NO LONGER AVAILABLE) A disk unit with one disk drive having a formatted capacity of 30M-bytes.

Model 4 004: (NO LONGER AVAILABLE) A disk unit with two disk drives having formatted capacities of 30M-bytes and 72M-bytes.

Model 5 005: A disk unit with two drives having formatted capacities of 44M-bytes each.

Model 6 006: A disk unit with two drives having formatted capacities of 44M-bytes each. (Provides the attachment capability for one 4708 Disk Unit Model 5.)

Streaming Tape Attachment Features: Attaches the Streaming Tape Drive (#6157) to the 4708 Disk Unit. The Streaming Tape Attachment Features when used with the Streaming Tape Drive provide high speed save/restore capability for 44 MB 5-1/4 inch hard files in the 4708 Disk Unit Model 5. These Features are field installable. (See Non-Communications Features section)

Customer Setup (CSU): The 4708 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, refer to the GI section. One copy of the CSU Instructions is shipped with each 4708. The diagnostics are included on the diagnostic diskette shipped with the 4701 model 3 or the 4702.

HIGHLIGHTS

The 4708 Disk Unit provides disk storage for the 4700 Finance Communication System. The 4708 attaches to the 4701 Model 3 (Model 5 only) Controller and the 4702 Branch Automation Processor via a Disk Unit Adapter feature (Models 5 and 6).

Disk Storage for the 4708 is provided by 5.25-inch high density non-removable disk drives. Models 5 and 6 of the 4708 provide two 44M-byte Disk Drives each.

Streaming Tape Attachment Features: Attaches the Streaming Tape Drive (#6157) to the 4708 Disk Unit. The Streaming Tape Attachment Features when used with the Streaming Tape Drive provides high speed save/restore capability for the 44MB 5-1/4 inch hard files in the 4708 Disk Unit Model 5. It is recommended that streaming tape operations (Save/Restore) be done during non-operational periods because of the following:

1. A disk being saved/restored to/from a streaming tape, CAN NOT BE USED by any application program for the duration of the streaming operation.
2. References to other DASD devices will take significantly longer than normal during a streaming operation. See related product documentation for details.

(See Non-Communications Features section.)

Customer Responsibilities: All customers must be advised that their responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
- Receipt at the customer's receiving dock, unpacking and set-up of the unit.
- Performing 4708 checkout in accordance with supplied procedures for initial installation or relocation, and updating of processor diskettes (at customer option).
- Physical setup and connection of cables in protected customer access areas including cables for the Disk Unit.
- Security for erasure of data from a failing disk unit being serviced by IBM. It is IBM's practice to erase any remaining data on a replaced disk before reusing it.
- Using the problem determination procedures provided with the 4708 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to requesting IBM service (see "Maintenance" below). If IBM service is requested, the 4708 must be attached to a 4701 mdl 3 or 4702.
- Determining the need for any required spares.
- Notifying IBM of intent to relocate the 4708 and following IBM instructions regarding relocation.

Publications: For information on 4700 publications, refer to the "4700 System Summary" (GC31-2016).

Controller or Processor Attachment: 4701 mdl 3 Controller: Attachment of all model 5(s) is provided via #3704 Disk Unit Adapter feature for one unit or #3705 Disk Unit Adapter for two units. Specify #9652 must be ordered for each second unit.

4702 Branch Automation Processor: Attachment of Model 5 is provided via the #3703 Disk Unit Adapter feature. When two 4708s are required, model 6 will attach to the 4702 and model 5 will attach to model 6. Specify #9653 must be ordered for each 4708 attaching to the 4702.

4702 Attachment: If 4708-005 is attached to 4702, specify #9653 to assure proper file addressing.

Maintenance: IBM on-site Repair warranty service is included in the purchase price of the machine and is provided under the Agreement for the Purchase of IBM Machines.

Maintenance service is available under the IBM Maintenance Agreement (Z125-3275). Only on-site repair is offered for this machine. IBM Hourly Service is available at the customer site.

It is the customer's responsibility to set up the equipment and to determine when maintenance is required.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

Second 4708 Disk Unit: Specify #9652 when the 4708 is used as the second unit. Feature #3705 must be ordered for the 4701 Model 3 Controller.

- Voltage: Specify #2998. Specify codes may not be required when ordering a 4708. If no code is specified, the appropriate default will be assumed based on the three-digit country code. Default countries are shown below:

MACHINES

Argentina	Chile	Sri Lanka
Australia	New Zealand	Uruguay

All of the above will be shipped with 220/240V AC, 50 Hz.

Brazil	Japan	South Korea
Canada	Mexico	Taiwan
Domin Repub	Peru	Venezuela
Ecuador	Philippines	

All of the above will be shipped with 50/60 Hz, 120V.

For countries not listed above, specify:

50 Hz	60 Hz
100V to 110V #9893	100V to 120V #9892
200V to 240V #9894	

(Canada Only) Specify #9890 for locking plug. If not specified, a non-locking plug will be provided (for 60 Hz, 120V, 1-phase). (<)

(Japan Only) Specify #9890 for locking plug. If not specified, a non-locking plug will be provided (for voltages under 200V). (<)

(Except Canada and Japan) The three-digit WT country code of the DP Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each country. If an AC power source other than the most common in the country is specified, and it is incompatible with the power plug commonly supplied, no power cord will be shipped unless a country RPQ is initiated. (<)

- A line cord of 3.0m (9.8 ft) and the country approved plug will be provided at the time of shipment.
- Machine Nomenclature: The machines will be shipped to countries with the following nomenclature defaults:

Argentina	Spanish
Australia	English
Brazil	Portuguese
Canada	Canadian/French
Chile	Spanish
Domin Republic	Spanish
Ecuador	Spanish
Japan	Japanese

Mexico	Spanish
New Zealand	English
Peru	Spanish
Philippines	English
South Korea	English
Sri Lanka	English
Taiwan	English
Uruguay	Spanish
Venezuela	Spanish

If exceptions are required or if none is listed for your country, specify from the following list:

English	#2927	Portuguese	#2933
Canadian/French		Spanish	#2931
Bilingual	#2934		

SPECIAL FEATURES

Non-Communication Features

Note: Unless otherwise stated, all features available for Field Installation requires service personnel.

6157 Attachment Feature (#3733): Provides the attachment feature in the 4708 Disk Unit. Maximum: One. Limitations: Model 5 or Model 6 only. Field Installation: These features are field installable via RPQs.

6157 Attachment Feature and Switch Function (#3734): Provides the attachment feature and switch function in a 4708 Disk Unit to attach the 6157 to a 4702 Processor and 4708 Disk Unit or attach a 6157 to dual 4708s. Maximum: One. Limitations: Model 5 or Model 6 only. Field Installation: These features are field installable via RPQs.

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

SUPPLIES (NONE)

4710 FINANCE COMMUNICATION SYSTEM RECEIPT/VALIDATION PRINTER

PURPOSE

The 4710 receipt/validation printer is a table top printer designed to fit into a teller workstation along with other teller operated key-boards and displays. The 4710 attaches to a controller via a loop, which operates at speeds of 1200, 2400 or 4800 bps. The 4710 attaches to the Personal Computer and the Personal Computer XT via the 4700/PC Financial Output Adapter Option. (See M5150 or 5160 pages for further information.)

MODELS

Model 001: Provides for banking receipt, validation and journal functions. Has a 96-character set (Japan only) or 128-character set (Katakana) and prints at 10 or 12 characters per inch.

Model 002: Provides for banking receipt and validation printing without the journal. Has a 96-character set (Japan only) or 128-character set (Katakana) and prints at 10 or 12 characters per inch.

Prerequisites: Model 1, an available position on a loop of a 4700 or 3600 Finance Communication System. Model 2, an available position on a loop of a 4700 Finance Communication System.

Programming Support: Programs previously developed for the 4710 model 1 can be utilized on the 4710 model 2 without changes, provided those programs support the 4710 model 1 as a cut-form printer only.

Customer Setup (CSU): The 4710 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, refer to the GI section of the Sales Manual. One copy of the CSU Instructions is shipped with each 4710. The CSU allowance is four days.

HIGHLIGHTS

The 4710 printer prints on a variety of forms and paper stock to provide for banking receipt, validation and (on the model 1) journal functions. It prints on single, double or triple part forms such as checks, receipts and validation documents. Documents are inserted vertically and do not require edge justification. Forms can easily be inserted/positioned with one hand to a fixed bottom registration point.

Printing operations are initiated manually via either of two separate keys if shared, or automatically upon sensing an inserted document. Either option can be selected under application program control.

Ribbon replacement is a "clean hands" operation.

Printing is bidirectional with a maximum of 120 characters per second at 12 cpi, and a maximum of 100 characters per second at 10 cpi, selectable by Application program. The 4710 printer can print from one to four lines per document. BOLD printing (2 x normal character width) is standard, selectable by application program.

Sixteen customer-designable characters can be added to the character set.

Shared Workstations is included. (Station A/B Start Keys.)

Address sharing is supported. Like and Unlike devices. (Printer with Printer and Printer with Display.)

For mdl 1, a Locked Journal Roll function is standard. One- or two-part paper rolls may be used.

Single part rolls may be 25.4m (100 ft) in length.
 Two part rolls may be 12.7m (50 ft) in length.
 A tear bar is provided for the exiting paper.

A slot is provided to permit manually writing on the journal.

The Journal Print Station is located directly behind the Document Print Station, thus allowing the same lines which print on the cut form document to print on the journal roll.

Indicator Lights:

- Ready: Indicates status of loop communications.
- Check: Indicates a machine check.
- Insert Form: Signals operator to insert form; when extinguished, verifies form accepted. Controlled by application program.
- Programmable Indicators: For mdl 1 there are two, mdl 2 has three. Controlled by application program.
- Journal Paper Out: (Model 1 only) Paper nearing end.

Operator Control Keys: Four control keys are provided on the mdl 1. Three control keys are provided on the mdl 2.

- Start Keys (2)
- Stop Key
- Journal Advance Key (Model 1 only)

Forms Specifications: Refer to "Forms Design Reference Guide for Printers", GA24-3488.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional, and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4710.
- Replacement of ribbon and paper on the mdl 1. (See "Supplies" below.)
- Performing 4710 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical setup, connection of cables in protected customer access areas including loop cables.
- Using the problem determination procedures provided with the 4710 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM Service/Exchange Center, or calling IBM if on-site exchange service is required. (See "Maintenance" below)
- Determining any required spares.
- Notifying IBM of intent to relocate and following IBM instructions for relocation.

Maintenance: The following services are available for an annual charge:

- IBM On-Site Exchange (IOE)
- Customer On-Site Exchange (COE)
- Customer Carry-In Exchange (CCE)
- Customer Carry-In Repair (CCR)

IBM On-Site Exchange: This service allows the customer to call the customer service branch office, after the customer has performed CPAR. An IBM representative will bring a replacement unit to the customer site, set-up and test the replacement unit; and remove the defective unit. The defective unit becomes the property of IBM.

Customer On-Site Exchange: This service allows the customer to call the customer service branch office, after the customer has performed CPAR. IBM will arrange for delivery of a replacement unit

to the site specified by the customer using various delivery methods. The customer is responsible for set-up and testing of the replacement unit using CSU procedures. The customer returns the defective unit to IBM as instructed by IBM. The delivery transportation charge to and from the customer site is paid by IBM. The defective unit becomes the property of IBM.

Customer Carry-In Exchange: To use this service, after isolating a defective unit using CPAR procedures, the customer calls the customer service branch office and transports the defective unit to a designated IBM Service/Exchange Center (S/EC). IBM will provide an equivalent, functioning unit on an exchange basis. The customer is responsible for delivery charges to and from the S/EC. The customer is responsible for set-up and testing of the replacement unit using CSU procedures. The defective unit becomes the property of IBM.

Customer Carry-In Repair: To use this service, after isolating a defective unit using CPAR procedures, the customer transports the defective unit to the designated IBM S/EC. The IBM S/EC will ship the defective unit to an IBM Repair Center where it will be repaired and returned to the S/EC to await customer pick-up. (The customer may ship (prepaid) a defective unit directly to a designated Repair Center in its original shipping container or equivalent. IBM will return the repaired unit prepaid.) The customer is responsible for set-up and testing of the repaired unit using CSU procedures.

Hourly Service: Hourly service may be obtained by calling the IBM toll-free number. The customer will then be given instructions for delivering the machine to IBM for such service.

Warranty Service: The warranty period is three months following the date of installation.

Note: Customer Carry-In Exchange service is provided for all warranty coverage except when a Warranty Option plan is in effect.

Not all Warranty Option plans are available in each country. Contact the country Service Department for available options and applicable terms and conditions in your country.

Warranty Option: This plan is intended for customers who desire a more convenient service coverage for the three month warranty period and for the nine months following the warranty period.

The Warranty Option plan may be selected at the time of order by using Feature Codes 9799 or 9826. The selected plan will supersede the basic CCE service during the warranty period and will continue for nine months following that period.

If a Warranty Option plan is ordered from the Service Branch Office after installation and during the three month warranty period, the plan will supersede the basic CCR service for the remainder of the three month period and will continue for nine months after that period. Implementation of a Warranty Option plan during the three month warranty period does not extend that period.

Warranty Option plans available:

Warranty Option plan IOE -- Feature Code 9799

Warranty Option plan COE -- Feature Code 9826

If IBM maintenance coverage is not contracted to begin immediately following expiration of any service and parts warranty and the customer subsequently wants IBM maintenance coverage, the machine(s) must be certified by the customer as begin in good working order prior to placing them on IBM maintenance. If the customer does not certify the machine(s) then they must be inspected to determine whether or not the machine(s) still qualifies for IBM maintenance. The customer must ship the machine(s) to a designated IBM Repair Center or Service/Exchange Center. A minimum charge to cover handling, inspection, cleaning, testing and return shipping charges will be applied. In addition, if the unit requires repair and repair is requested, all parts needed are billed at the prevailing IBM parts prices and the additional time required for the repair is billed at the applicable IBM service rates. The machine then becomes eligible for IBM maintenance coverage.

If on the basis of the inspection, IBM concludes that the machine is not repairable, no further work will be performed and the machine will be returned to the customer subject to the minimum charges.

Publications: For information on Publications about the 4710, refer to the "IBM 4700 Finance Communication System: Summary", GC31-2016.

Cables: For information on loop cabling, refer to 'Accessories' in the M4701 pages.

SPECIFY

Unless indicated otherwise, the following specify and order codes are only available at time of manufacture.

- **Voltage:** Specify #2998. Then select one of the following:

50 Hz	60 Hz
100V to 110V #9893	100 to 120V #9892
200V to 240V #9894	

- (Canada and Japan only) Voltage: 120V AC, - 60 Hz; Specify #2998 only.

- **Plugs/Linecord:** Locking plug: Specify #9890 If not specified, order will default to a nonlocking plug.<)

(Except Canada) The 3-digit WT Country of the ISG Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each country. If an exception to the above is required, a Country RPQ may be initiated.<)

Note: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug is shipped unless the Country RPQ referenced above is initiated.

- **Machine Nomenclature:**

Canadian/French Bilingual	#2934
English	#2927
Japan	#2930
Portuguese	#2933
Spanish	#2931

Field installation not recommended.

- **Printer Character Set Groups:** (Japan only: Katakana (#2973) 128-character set). Unique characters of other WT Character Sets are loaded into the terminal at time of CPGEN. They do not have to be specified at time of order.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

Locks and Keys: The 4710 is shipped with two identical keys for the cover lock. Additional keys may be purchased from IBM. Order via MES from plant of manufacture. Indicate serial number of lock.

SUPPLIES

The following items, available from the National Distribution Division (NDD), or their equivalents, are required.

MACHINES

Paper (Model 1 only)

100-ft single journal roll action paper:

Carton of 48 rolls 4.5 in. wide, P/N 7032894
One roll 4.5 inches wide, P/N 7032895

50-foot two-part journal roll action paper:

Carton of 48 rolls 4.5 inches wide, P/N 7032919
One roll 4.5 inches wide, P/N 7032920

Ribbon

Black Ribbon, one box; P/N 7037985
Purple Ribbon, one box; P/N 7033537

One ribbon is provided with each printer.

4715 CONTINUOUS FORMS PRINTER

PURPOSE

The 4715 is a table-top, serial, bidirectional, wire matrix, impact printer. It is a multi-function printer capable of high speeds and quality printing of alphanumeric characters and symbols on continuous forms or cut forms. The 4715 provides appropriate printing capabilities for a variety of administrative functions. The 4715 attaches to a 4701 Controller via a B loop. The 4715 attaches to the Personal Computer and the Personal Computer XT via the 4700/PC Financial Output Adapter Option. (See M5150 or 5160 pages for further information.)

MODELS

Model 1 001

Prerequisites: An available position on a loop of a 4701 Controller.

Customer Setup (CSU): The 4715 is designated a customer setup machine, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU refer to the GI section. One copy of the CSU Instructions is shipped with each 4715. The CSU allowance is four days.

HIGHLIGHTS

- Attaches to the 4701 Controller via a loop that operates at speeds of 1200, 2400, or 4800bps.
- Prints on continuous forms paper from 114.3 to 254mm (4.5 to 10.0 in.) wide (edge-to-edge).
- Prints on cut forms with multiple parts up to 0.28mm (0.011 in.) in total thickness.
- Accepts cut forms from 98.04mm (3.86 in.) up to a maximum of 254mm (10 in.) in width, and 127mm (5.0 in.) up to a maximum of 457mm (18.0 in.) in length.
- Clean hands ribbon replacement.
- Small footprint 469.9mm (18.5 in.) in width by 411mm (16.18 in.) in depth by 148mm (5.89 in.) in height without the forms feed tractor. 106mm (4.0 in.) higher with tractor.
- Supports both regular and quality print.
- Bidirectional printing at:

Characters per Inch	Characters per Second	Type of Print
10	180	Regular
10	90	Quality
12	216	Regular
12	108	Quality
17	154	Regular

All program selectable.

- Has an 8-inch print line and capable of printing up to 136 characters on a line at 17 characters per inch.
- Line spacing of five or six lines per inch. Program selectable.
- Incremental line spacing available 1/120 inch per step.
- Bold printing capability is standard.
- Continuous underline feature.
- An 18-wire print head that is customer-replaceable.

- Removable tractor feed.
- 212-character set, 16 customer-definable characters.
- Supports address sharing on like and unlike devices (printer-with-printer and printer-with-display).
- Nine indicator lights.
- Five control keys.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4715.
- Providing paper.
- Replacement of ribbon.
- Performing 4715 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical setup, connection of cables in protected customer access areas including loop cables.
- Using the problem determination procedures provided with the 4715 to determine the failing unit and for filling out the appropriate 4700 Problem Report prior to forwarding the failing unit if an IBM Service/Exchange Center, or calling IBM if on-site exchange service is required. See "Maintenance" below.
- Replacing worn or defective print heads and maintaining a supply of spare print heads.
- Determining any required spares.
- Notifying IBM of intent to relocate and following IBM instructions for relocation.

MAINTENANCE

The following services are available for an annual charge:

- IBM On-Site Exchange (IOE)
- Customer On-Site Exchange (COE)
- Customer Carry-In Exchange (CCE)
- Customer Carry-In Repair (CCR)

IBM On-Site Exchange: This service allows the customer to call the customer service branch office after the customer has performed CPAR. An IBM representative will bring a replacement unit to the customer site, install the customer's print head, set-up and test the replacement unit; and remove the defective unit. The defective unit becomes the property of IBM.

Customer On-Site Exchange: This service allows the customer to call the customer service branch office after the customer has performed CPAR. IBM will arrange for delivery of a replacement unit to the site specified by the customer using various delivery methods. The customer is responsible for installing a print head and set-up and testing of the replacement unit using CSU procedures. The customer returns the defective unit to IBM as instructed by IBM. The delivery transportation charge to and from the customer site is paid by IBM. The defective unit becomes the property of IBM.

Customer Carry-In Exchange: To use this service, after isolating a defective unit using CPAR procedures, the customer calls the customer service branch office and transports the defective unit to a designated IBM Service/Exchange Center (S/EC). IBM will provide

an equivalent, functioning unit on an exchange basis. The customer should remove and retain the print head from the defective unit. The customer is responsible for delivery charges to and from the S/EC and is also responsible for set-up and testing of the replacement unit using CSU procedures. The defective unit becomes the property of IBM.

Customer Carry-In Repair: To use this service, after isolating a defective unit using CPAR procedures, the customer transports the defective unit to the designated IBM S/EC. The IBM S/EC will ship the defective unit to an IBM Repair Center where it will be repaired and returned to the S/EC to await customer pick-up. (The customer may ship (prepaid) a defective unit directly to a designated Repair Center in its original shipping container or equivalent. IBM will return the repaired unit prepaid.) The customer is responsible to set-up and test the repaired unit using CSU procedures.

Hourly Service: Hourly service may be obtained by calling the IBM toll-free number. The customer will then be given instructions for delivering the machine to IBM for such service.

Warranty Service: The warranty period is 3 months following the date of installation.

Customer Carry-In Exchange Service is provided for all warranty coverage except when a Warranty Option Plan is in effect.

Not all Warranty Option plans are available in each country. Contact the country Service Department for available options and applicable terms and conditions in your country.

Warranty Option: This plan is intended for customers who desire a more convenient service coverage for the 3 month warranty period and for the 9 months following the warranty period.

The Warranty Option plan may be selected at the time of order by using Feature Codes #9799 and #9826. The selected plan will supersede the basic CCR service during the warranty period and will continue for 9 months following that period.

If a Warranty Option plan is ordered from the Service Branch Office after installation and during the 3 month warranty period, the plan will supersede the basic CCE service for the remainder of the 3 month period and will continue for 9 months after that period. Implementation of a Warranty Option plan during the 3 month warranty period does not extend that period.

Warranty Option plans available:

Warranty Option plan IOE - Feature Code #9799
Warranty Option plan COE - Feature Code #9826

If IBM maintenance coverage is not contracted to begin immediately following expiration of any service and parts warranty and the customer subsequently wants IBM maintenance coverage, the machine(s) must be certified by the customer as being in good working order prior to their being placed on IBM maintenance. If not certified the machine(s) must be inspected to determine whether or not the machine(s) still qualifies for IBM maintenance. The customer must ship the machine(s) to a designated IBM Repair Center or Service/Exchange Center. A minimum charge to cover handling, inspection, cleaning, testing and return shipping charges will be applied. In addition, if the unit requires repair and repair is requested, all parts needed are billed at the prevailing IBM parts prices and the additional time required for the repair is billed at the applicable IBM service rates. The machine then becomes eligible for IBM maintenance coverage.

If on the basis of the inspection, IBM concludes that the machine is not repairable, no further work will be performed and the machine will be returned to the customer subject to the minimum charges.

Marketing Information: IBM Credit Corporation Financing. The 4715 is available for Term Lease. Refer to HONE LEASCALC for specific lease options, terms, and rates.

Forms Specification: Refer to "IBM Planning and Operations Manual", (GC31-2536).

Publications: The following publications will be available from Mechanicsburg on or after May 15, 1984: "IBM 4715 Planning and Operations Manual", (GC31-2536) -- "IBM 4715 Setup Instructions", (GC31-2535) -- "IBM 4715 Repair Manual", (SC31-3538).

SPECIFY

Unless indicated otherwise, the following specify and order codes are only available at time of manufacture.

- Power: Specify #2998 then select one of the following:

50 Hz	60 Hz
100V to 110V #9893	100V to 120V #9892
200V to 240V #9894	

- (Canada only > Power (120V AC, 60 Hz): Specify #2998 only. <)
- (Canada only > Power Plugs: Specify #9890 for a locking plug. If not specified order will default to a nonlocking plug. <)
- (Except Canada > Power Plugs: The three digit WT country of the ISG Machine Order Sheet is used to select a power plug that matches the most commonly-used power supply in each country. If an exception to the above is required, a Country RPQ may be initiated. <)
- Power Plugs and Line Cords: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug is shipped unless the Country RPQ referenced above is initiated.
- Machine Nomenclature:

Canadian-French	Portuguese #2933
Bilingual #2934	Spanish #2931
English #2927	

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS (NONE)

ACCESSORIES

Forms Stand: Permits feeding of continuous forms from the carton and provides for stacking after printing. For shipment with the machine, order by device code #4450. For field installation order via MES using P/N 2243650.

SUPPLIES

The following items are available from IBM.

Ribbons: Black ribbon P/N 6097704. One ribbon is supplied with the printer.

Print Head, Customer-Replaceable (P/N 6097705): One print head is supplied with the printer. The print head is a consumable item, and to assure maximum availability, it is recommended that the customer have at least one spare print head for every four units.

4720 - FINANCE COMMUNICATION SYSTEM

FORMS/PASSBOOK PRINTER

PURPOSE

The 4720 forms/passbook printer is a family of table-top printers designed to fit into a teller or administrative workstation along with other 4700 devices. The 4720 printer is available in a series of models intended to provide appropriate printing capabilities for a variety of financial applications. The 4720 printers attach to 4701 controllers via a loop. Attachment to 3600 controllers is supported by PRPQ 5799-BJE. The 4720 attaches to the Personal Computer and the Personal Computer XT via the 4700/PC Financial Output Adapter Option. (See M5150 or 5160 pages for further information.)

MODELS

Model 1 001: Provides cutform printing capability.

Model 2 002: Provides cutform and journal printing capability.

Model 3 003: Provides cutform and passbook printing capability.

Model 4 004: Provides cutform, passbook, and journal printing capability.

Prerequisites: An available position on a loop of a 4701 Finance Communication System Controller.

Customer Setup (CSU): The 4720 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. One copy of the CSU Instructions is shipped with each 4720. The CSU allowance is four days.

HIGHLIGHTS

The 4720 printer provides the capability to print on a range of sizes of cutforms or passbooks. Journal printing is also available, depending on model.

Printing is bidirectional at a maximum of 120 characters per second. Printing takes place at 10, 12 or 16 2/3 cpi, selectable by application program.

Forms advance can be specified at 5 or 6 lines per inch, or in 1/90 inch steps, selectable by application program.

Shared Workstations is included, implemented by two Start keys. In a non-shared environment, printing operations can be initiated manually via either of the two separate start keys, or automatically upon sensing an inserted document. Either option can be selected under application program control.

Ribbon replacement is a "clean hands" operation.

The basic machine provides a set of 212 characters. From this set, character sets of up to 192 characters may be selected. In addition to standard alphabets and numerics, this set includes diacritic characters used in most countries, and special characters used in both data processing and word processing applications. Non-Latin Languages (Arabic, Hebrew, and Greek), and Katakana are supported via Specify Features. Sixteen customer-designable characters can be added to the character set. The above set is available in both standard and quality print. BOLD printing (2 x normal character width) is standard.

A Quality Print function is provided. When performing quality print, the 4720 makes two printing passes over each line. Both printing passes begin at the same margin, and each pass is made at one half of the normal print head speed. The quality print characters have a more formal, typewriter-like appearance suitable for applications requiring a higher print quality than the standard matrix character.

This function is not provided when printing at 16 2/3 cpi. This function is not provided on machines with the Katakana character set.

Address sharing is supported. Like and Unlike devices. (Printer with Printer and Printer with Display.)

A Locked Journal Roll function is standard on mdl 2. One- or two-part rolls of 8.5 in. width can be used. Single-part rolls may be 27.4m (90 ft) in length. Two-part rolls may be 13.7m (45 ft) in length. A tear bar is provided for the exiting paper.

The Journal Print Station is located directly behind the Document Print Station, thus allowing the same lines which print on a cut-form document to print on the journal roll.

The 4720 attaches to a 4701 controller via a loop, which operates at speeds of 1200, 2400, or 4800 bps.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4720.
- Replacement of ribbon and paper. (See Supplies below).
- Performing 4720 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical set-up, connection of cables in protected customer access areas including loop cables.
- Using the problem determination procedures provided with the 4720 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM Service/Exchange Center, or calling IBM if on-site exchange service is required. See "Maintenance" below.
- Determining any required spares.
- Replacing worn or defective print heads and maintaining a supply of spare printheads.

Maintenance: The following services are available for an annual charge:

- IBM On-Site Exchange (IOE)
- Customer On-Site Exchange (COE)
- Customer Carry-In Exchange (CCE)
- Customer Carry-In Repair (CCR)

IBM On-Site Exchange: This service allows the customer to call the customer service branch office, after the customer has performed CPAR. An IBM representative will bring a replacement unit to the customer site, install the customer's print head, set-up and test the replacement unit; and remove the defective unit. The defective unit becomes the property of IBM.

Customer On-Site Exchange: This service allows the customer to call the customer service branch office after the customer has performed CPAR. IBM will arrange for delivery of a replacement unit to the site specified by the customer using various delivery methods. The customer is responsible for installing a print head and set-up and testing of the replacement unit using CSU procedures. The customer returns the defective unit to IBM as instructed by IBM. The delivery transportation charge to and from the customer site is paid by IBM. The defective unit becomes the property of IBM.

Customer Carry-In Exchange: To use this service, after isolating a defective unit using CPAR procedures, the customer calls the customer service branch office and transports the defective unit to a designated IBM Service/Exchange Center (S/EC). IBM will provide an equivalent, functioning unit on an exchange basis. The customer

should remove and retain the print head from the defective unit. The customer is responsible for delivery charges to and from the S/EC and is also responsible for set-up and testing of the replacement unit using CSU procedures. The defective unit becomes the property of IBM.

Customer Carry-In Repair: To use this service, after isolating a defective unit using CPAR procedures, the customer transports the defective unit to the designated IBM S/EC. The IBM S/EC will ship the defective unit to an IBM Repair Center where it will be repaired and returned to the S/EC to await customer pick-up. (The customer may ship (prepaid) a defective unit directly to a designated Repair Center in its original shipping container or equivalent. IBM will return the repaired unit prepaid.) The customer is responsible to set-up and test the repaired unit using CSU procedures.

Hourly Service: Hourly service may be obtained by calling the IBM toll-free number. The customer will then be given instructions for delivery the machine to IBM for such service.

Warranty Service: The warranty period is 3 months following the date of installation.

Customer Carry-In Exchange service is provided for all warranty coverage except when a Warranty Option Plan is in effect.

Not all Warranty Option plans are available in each country. Contact the country Service Department for available options and applicable terms and conditions in your country.

Warranty Option: This plan is intended for customers who desire a more convenient service coverage for the 3 month warranty period and for the 9 months following the warranty period.

The Warranty Options plan may be selected at the time of order by using Feature Codes #9799 or #9826. The selected plan will supersede the basic CCR service during the warranty period and will continue for 9 months following that period.

If a Warranty Option plan is ordered from the Service Branch Office after installation and during the 3 month warranty period, the plan will supersede the basic CCE service for the remainder of the 3 month period and will continue for 9 months after that period. Implementation of a Warranty Option plan during the 3 month warranty period does not extend that period.

Warranty Option plans available:

Warranty Option plan IOE - Feature Code #9799
Warranty Option plan COE - Feature Code #9826

If IBM maintenance coverage is not contracted to begin immediately following expiration of any service and parts warranty and the customer subsequently wants IBM maintenance coverage, the machine(s) must be certified by the customer as being in good working order prior to their being placed on IBM maintenance. If not certified the machine(s) must be inspected to determine whether or not the machine(s) still qualifies for IBM maintenance. The customer must ship the machine(s) to a designated IBM Repair Center or Service/Exchange Center. A minimum charge to cover handling, inspection, cleaning, testing and return shipping charges will be applied. In addition, if the unit requires repair and repair is requested, all parts needed are billed at the prevailing IBM parts prices and the additional time required for the repair is billed at the applicable IBM service rates. The machine then becomes eligible for IBM maintenance coverage.

If in the basis of the inspection, IBM concludes that the machine is not repairable, no further work will be performed and the machine will be returned to the customer subject to the minimum charges.

Forms Specifications: Refer to "4700 Installation Planning Manual", GC31-2018.

Publications: IBM 4720 Forms/Passbook Printer Introduction and Installation Planning (GC31-2050).

The Introduction includes a product description, configuration data, forms specifications, and physical planning information for the 4720 printer.

Cables: For information on loop-cabling, refer to the accessories section in M4701 pages.

SPECIFY

Unless indicated otherwise, the following specify and order codes are only available at time of manufacture.

- Power (AC, 1-phase): Specify #2998 then select one of the following:

50Hz		60Hz	
100V	#2804	100V	#2730
110V	#2805	110V	#2822
200V	#2806	120V	#9911
220V	#2813		
230V	#2821		
240V	#2801		

A line cord of 3.0m (9.8 ft) and the country approved plug will be provided at the time of shipment.

- Plugs:

(Canada only > Specify #9890 for a locking plug or #9891 for a nonlocking plug (for 120V, 1-phase, 60 Hz). <)

(Japan only > Specify #9890 for a locking plug or #9891 for a nonlocking plug (for voltages under 200 Volts). <)

(Except Canada and Japan > The 3-digit WT Country Code of the ISG Machine Order Sheet is used to select a power plug which matches the most commonly-used power supply in each country. If an exception to the above is required, a Country RPQ may be initiated. <)

Note: If a power supply, not the most common, is specified, and it is incompatible with the power plug commonly supplied, a power cord without a plug is shipped unless the Country RPQ referenced above is initiated.

- Machine Nomenclature:

Canadian French Bilingual #2934
English #2927
Japanese #2930
Spanish #2931

- Printer Character Set Groups: Katakana #2973 128 character set. Other unique country Character Sets are generated for the terminal at time of CPGEN. They do not have to be specified at time of order.

SPECIAL FEATURES (NONE)

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES (NONE)

SUPPLIES

Paper: 90 feet single-part journal roll action paper. Carton of 24 rolls 8.5 in. wide P/N 457363. 45 feet two-part journal roll action paper. Carton of 24 rolls 8.5 in. wide P/N 457365.

Ribbon: Black Ribbon, P/N 7032757.

The above Supplies may be ordered through your IBM NDD-SS Sales Representative

Print Head, Customer Replaceable P/N 7034533: One print head is supplied with the printer. The print head is a consumable item, and to assure maximum availability, it is recommended that the customer have one spare print head per location on hand.

The Print Head, being a consumable item should not be taken or sent to Exchange or Repair Centers. If the Print Head fails during the warranty period, the customer should call the Charlotte Hot Line 704-594-1194 collect or Tie Line 794-1194. The serial number of the

failing 4720 is required to verify the warranty period. A new Print Head will be sent to the customer. The defective Print Head will be returned to Charlotte.

Ribbon Shield, Customer replaceable, P/N 8259646: One ribbon shield is supplied with the print head. The ribbon shield is a consumable item and to assure maximum availability, it is recommended that the customer have a minimum of one spare ribbon shield at each location.

4721 SELF SERVICE DOCUMENT PRINTER

PURPOSE

The 4721 is a document printer for self service applications in unattended lobby and vestibule environments. It attaches to a 4701 controller or a 4702 branch processor via the loop. The 4721-B01 comes with a manual card reader; the 4721-B02 comes with a motorized card reader/encoder. It extends IBM's self service banking offering.

MODELS

Model B01: Manual operated identification card reader with Track 2 read, no upgrade possible.

Model B02: Motorized identification card reader with tracks 2 and 3 read and track 3 encode.

Prerequisites: For all installations, the 4721 Terminal Control Code PRPQ 7B1428 (Program #5799-WZF) has to be ordered once per customer/host from EPL Copenhagen. This is a no-charge PRPQ to be loaded from the host to the 4721. The program has to be ordered at the respective library which are APL, SAL, SPL or CPL.

For customers not having installed the 4730 Personal Banking Machine Customization Image Builder (Licensed Program #5668-870 Rel. 2.2), the 4721 Application & Installation Support Program (Licensed Program #5777-DBP) has to be ordered from EPL Copenhagen. This Program Offering includes Customization support, a sample APB and operational support for the Financial Application Program (FAP). The program has to be ordered at the respective library which are APL, SAL, SPL or CPL.

- To attach to the 4700 Banking Loop, the B-Loop Feature #3010 is required on the 4721.
- One available position on a loop of a 470X or a 5989-B01.

Customer Setup (CSU): Yes.

HIGHLIGHTS

The 4721 provides a range of self service document printing applications including bank account statements, deposit balance, mail box, personal and general bank informations. It also provides the capability for account balance inquiry by means of the display. The 4721 accepts magnetic cards, PIN entries and function selections. It prints or displays the requested information, cuts the printed document, collects it if more than one sheet requested in a bundling unit and issues the documents as a bundle. A document retract capability is also provided.

In the design of the 4721 particular attention has been paid to privacy, security, appearance, physical size and human factors.

Standard Features:

- Customization of keyboard, display and transaction sequence. User guidance via a 40 character display.
- Numeric keyboard input for PIN, 6 function keys, encryption of PIN.
- Two models with either manual card reader or motorized reader/encoder, card retract and card capture function on motorized reader, card eject on power fail.
- Matrix printer module with 200 cps, 10/12/15 cpi, 6/8 lpi, "near letter quality" and graphics capability, document cutting and bundling, document retract for forgotten documents.
- Supported by RM 4700 AMG and RM 4700 CTRL as general purpose media (Record I/O).
- Support for major worldwide Latin languages on printer and display by a character set of 192 characters.

DESCRIPTION

The 4721 is an intelligent self service document printer which automates financial services as account statement printing, display of the account status, printing of deposit status, mail box, general or personal customer information, as well as other information which can be defined by the banking institution.

The transaction flow of these functions can be customized to a certain extent by means of a customization image.

Customization support is provided either with the 4730 Personal Banking Machine Customization Image Builder (Licensed Program #5668-870, Rel. 2.2) or with the 4721 Application & Installation Support Program (Licensed Program #5777-DBP).

The 4721 may run in unattended mode in lobby or vestibule environment. It is offered as table top device but it is possible to mount it on a stand or integrate it into customer furniture.

The 4721 is available in two models, distinguished by the type of card reader which is a manual operated push-pull reader in 4721-B01 and a motorized reader/encoder in the 4721-B02.

Both models incorporate in addition a display for user guidance, a keyboard for PIN entry and the printer assembly.

- **Display:** The display is used for user and operator guidance. It is designed in vacuum fluorescent technology. Two lines with 20 characters each are provided. The display is equipped with a privacy filter.

The 4721 incorporates an international Latin character set of 192 characters. There is a separate highly visible READY indicator showing the status of the printer.

- **Keyboard:** The integrated horizontal keyboard is equipped with audio and tactile feedback. It consists of a numeric block for PIN entry, including one OK key and one Cancel key. Right to the numeric keys, four function keys are provided. The keyboard can be customized logically by program and physically by a customer supplied overlay. The function keys can be used for user language selection, selecting different print information or display account status. There is the provision to cover the function keys or the complete keyboard by a grid which is supplied with the machine. There are provisions for easy cleaning.
- **Identification Card Reader:** Two models of the 4721 are available, distinguished by the type of card reader.

The 4721-B01 comes with a manual operated push/pull reader with a similar user interface as it is available on the motorized reader. It provides read ISO track 2 with magnetic "stripe up" insertion. It processes cards according to ISO 2894/3554/7810.

The 4721-B02 comes with a motorized reader providing read tracks 2, 3 and write track 3. Tracks 2 and 3 adhere to ISO and ABA standards. Insertion orientation is "stripe up".

The card reader ejects a credit card (return to the user) upon power failure.

The card can be ejected to the user within a transaction by means of the cancel key. In this case the complete transaction will be canceled.

Under program control, the card reader can retain (capture) a card and there is also the capability to retract cards which were left by the user. The timeout for this function can be defined. A card bin for holding up to 30 identification cards being captured is provided.

The card reading mechanism has a lockout device which is ordinarily closed, preventing foreign objects from being inserted into the card reader. The reader recognizes the presence of a magnetic stripe when a card is inserted. The card,

If it has the correct size, is automatically fed into the reader, and the lockout gate closes for the duration of the transaction.

- Document print station: The document print station consists of the printer assembly, the cutting device and the document bundling/issue assembly. The printer prints variable length documents from single-ply fanfold paper without tractor feed holes. The friction type paper feed mechanism requires a printed mark at the left edge of the forms. Preprints are possible. The paper is cut following the printing of the document.

The speed of printing is 200 cps. Character densities of 10, 12 and 15 cpi and double wide characters are selectable by program. Line spacing is 6 lpi, 8 lpi and fractional spacing. The 4721 incorporates an international Latin character set of 192 characters for the printer.

The supported paper sizes are 150 - 216mm (5.9 - 8.5 inches) in width and 76.2 - 106mm (3.0 - 4.2 inches) in length. Possible paper weight is between 70 and 90 g/sqm. For detailed paper specifications refer to the 4721 Planning and Site Preparation Guide. The maximum paper supply is up to 2,000 forms to be stored within the printer (depends on paper weight and forms size). A major extension of the paper supply is possible in using a slot at the bottom of the 4721 to feed the paper into the printer. In this case the documents can be stored in a customer supplied printer stand or furniture. IBM supplies a specification describing a customer/vendor supplied printer stand. This offers the possibility to install the 4721 as stand-up box or included in customer furniture.

Paper load is motorized and forms positioning is done automatically. The printer contains a "paper end" and "paper jam" detection. The paper is to be supplied by the customer.

After printing and cutting of a document, it is fed into the bundling assembly. If there is more than one document to be printed for one user, the documents will be collected within the bundling unit and issued to the user as complete bundle. Maximum bundle size is ten documents. The 4721 offers the capability to retract documents which were left by the user. The timeout for this function can be defined. The retract compartment may collect up to 20 documents.

- The 4721 is attached to the 470X or the 5989 via the BLOOP. Loop speeds of 1,200, 2,400 and 4,800 baud are supported. Slot sharing is included.
- The 4721 uses the DES (National Bureau Of Standards) algorithm for PIN encryption.
- Network management support provided by either NetView or NPDA V3 handles the error description based on major and minor cause codes contained in the 4721 alert record. NetView and NPDA V3 will display available qualifier and alert identification data. The recommended actions are described in the 4721 Error Log Reference Manual GA19-5344.
- The 4721 may be completely serviced from the top and front.

Physical Specifications:

Width: 492mm (19.5 inches)
Depth: 308mm (12.2 inches)
Height: 400mm (15.8 inches)
Weight B01: 18 kg (40 pounds)
Weight B02: 20 kg (44 pounds)

Operating Environment:

Temperature - 10 to 40.6 degrees C (50 to 105 degrees F)
Relative Humidity - 8 to 80 percent
Wet Bulb - 26.7 degrees C (80 degrees F)

SPECIFY

Note: Multiple language documentation may be shipped with the machine for countries where applicable.

The country standard Voltage/Power Cord, Nomenclature/Language will automatically be supplied based on the country code of the order.

SPECIAL FEATURES

4700 BLOOP attachment (#3010): This feature is mandatory and allows the 4721 to be attached locally or remotely to a 4701 controller, a 4702 Branch Processor or a 5989 RTAU.

MODEL CONVERSIONS (NONE)

ACCESSORIES (NONE)

MACHINE ELEMENTS (NONE)

SUPPLIES

- Print ribbon cartridge assembly, P/N 6328829
- The 4721 is equipped with a keyboard overlay, P/N 6465499. If the customer wants a different overlay it may be ordered at a vendor according to IBM specifications (refer to the IBM 4721 Planning and Site Preparation Guide).

4723 FINANCE COMMUNICATION SYSTEM DOCUMENT PROCESSOR

(NO LONGER AVAILABLE)

PURPOSE

A Desk Top Reader/Inscriber with programmable functions for applications in the finance industry. The 4723 Document Processor forms a workstation together with the 4704 Display Terminal or the 3604 Keyboard Display. The 4723 attaches to the Personal Computer and the Personal Computer XT via the 4700/PC Financial Output Adapter Option. (See M5150 or 5160 pages for further information.)

The 4723 provides MICR or OCR reading/inscribing, audit trail printing, and stamping functions. Together with the 4704 or the 3604, data capture and proofing operations can be performed as well as processing of in-clearing and out-clearing of banking documents such as checks, credit transfers and bills of exchange.

MODELS

All models provide reader, inscriber, three pockets and B-loop attachment for local connection to controllers of the 4700 and 3600 Finance Communication System.

Manual Feed

Model 12A	12A	OCR-A font
Model 12B	12B	OCR-B font
Model 12C	12C	CMC-7 font
Model 12E	12E	E-13B font
Model 13C	13C	CMC-7 (Shared Station)

Auto Feed

Model 22A	22A	OCR-A
Model 22B	22B	OCR-B
Model 22C	22C	CMC-7
Model 22E	22E	E-13B

All inscribing is done with magnetic ink.

Prerequisites:

1. An available position on a loop of a 4700 or 3600 Finance Communication System.
2. A 4704 Display Terminal or a 3604 Keyboard Display to form a workstation with the 4723 Document Processor.
3. For 3600 host support, PSH-RPQ program number 5799-WWB.
4. Supplies for an operational machine (see Supplies):
 - Inscriber Ribbon Cartridge
 - Stamp heads, one for each stamp feature installed
 - Ink roll, one for each stamp feature installed
 - Printer Ribbon Cartridge, if Audit Trail Print feature is installed

Customer Setup: Machine only.

HIGHLIGHTS

The 4723 consists of a Document Processing Module and a Power Module connected by a 1.8 meter cable.

The basic Document Processing Module houses the manual or automatic document entrance, reader/inscriber stations and the three eject pockets of approximately 100 documents capacity each. The hopper of the automatic feed models allows for approximately 300

documents. A rear and/or front stamp station, an audit trail printer and an attachment for a 50-key Function Keyboard may be installed as optional features.

The stamps may have date included. The primary use of the rear side stamp is for endorsing, the primary use for the front side stamp is for validation.

The 4723 connects via a local loop to the 4700 or 3600 Finance Communication System Controllers.

The 4723 can be programmed to control most of the processing of a document without operator intervention or application program guidance. Decisions, such as when to inscribe, print or stamp, can be made in the 4723 for each document, also each document can be directed into one of the three pockets.

Documents: The pre-encoded OCR/MICR characters, print quality and codeline arrangement on the documents read by 4723 should meet the specifications recommended by ECMA and ISO for each specific font. 4723 produces characters/codelines according to the same standards. Documents within the following specifications can be processed:

Length	145 to 222mm
Width	70 to 110mm
Thickness	0.10 to 0.15mm
Weight	80 to 110 g/sq m

A document holder is available as an accessory.

Customer Setup (CSU): The 4723 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU refer to the General Information (GI) section of the Sales Manual. One copy of the CSU Instructions is shipped with each 4723.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all National, Regional and Local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of 4723.
- Performing 4723 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical set-up connection of cables in protected customer access areas including loop cables and cable that connects the Document Processing Module and the Power Module.
- Using the problem determination procedures contained in the 4723 Operator's Manual to determine the failing unit and filling out the 4700 Problem Report prior to requesting on-site maintenance service (see "Maintenance" below).
- Determining any required spares.
- Notifying IBM of intent to relocate and following IBM instructions for relocation.

Maintenance: Maintenance of 4723s is available under IBM Maintenance agreement contracts for on-site maintenance. It is the Customer's responsibility to install the equipment and to determine when maintenance is required. On-site maintenance is provided during the warranty period.

Customers with 4723s not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer sub-

sequently wants IBM Maintenance Agreement Coverage, he may have the machine(s) inspected.

If, on the basis of the inspection, it is concluded that the state of the machine precludes normal maintenance, the machine is returned to the customer without charge.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage. Power modules are separately available on request.

Publications:

- "Introduction to the IBM 4723 Document Processor", GA19-5383
- "IBM 4723 Document Processor Operating Instructions," GA19-5384
- "IBM 4723 Document Processor Component Description," GA19-5385

- "IBM 4723 Document Processor Setup Instructions", GA19-5393

Cables: For information on loop cabling, refer to the accessories section of M4701.

SPECIFY

Unless indicated otherwise, these specify feature are only available at time of manufacture.

The WT Country Code of the Machine Order Sheet is used to select Power, Power Plug and Nomenclature. Some countries have a specify option for nomenclature and power which overrides the default, see table 1.

Power/Nomenclature:

Table 1

Country	Power		Nomenclatur	
	Default	Opt*	Dfault	Opt*
Argntna-613	220V 50Hz		Span	2927
Austral-616	240V 50Hz		Eng	
Canada-649	120V 60Hz		Eng	2928
Chile-655	220V 50Hz		Span	2927
Colom -661	110V 60Hz		Span	2927
Japan-760	100V 50Hz	2730	Jap	2927
Mexico-781	120V 60Hz		Span	2927
New Zea-796	230V 50Hz		Eng	
Peru-815	110V 60Hz		Span	2927

Venez-871	120V 60Hz	Span	2927
-----------	-----------	------	------

* Option Specify: #2730 for 100V - 60Hz, #2927 for English UK and #2928 for French.

Note: A power plug, which matches the most commonly used power supply in each country is mounted on the 2.8 meter machine line cord, reference GA27-2786. The line cord for Canada is 1.8m (6 ft). If an exception to the above is required, a Country RPQ may be initiated.

SPECIAL FEATURES

Audit Trail Printer (#2705): Prints a maximum of 40 characters, including blanks, in one line on the back of the document. Characters are composed of a 7 x 7 dot matrix. Prints 15 characters per inch. One ribbon cartridge is delivered with the machine. For additional cartridge orders, refer to Supplies below. Field installation: No.

Keyboard Attachment (#2706): Provides for attachment of one 50-key Function Keyboard directly into 4723. The Keyboard should be ordered as a Workstation Element according to M4704 pages. Field installation: No.

Stamps: A front and/or rear stamp feature can be chosen. Front stamp (#2720), Maximum: One. Back stamp (#2721), Maximum: One. The Stamp Head includes a rubber plate the layout of which is made to customer requirements. Stamp Heads including plates are ordered as supplies. Field installation: No.

MODEL CHANGES

Available at time of manufacture only.

ACCESSORIES

Document holder (P/N 4732870): Holder for documents to be fed by the operator into the 4723. The holder is to be placed on the table surface and positioned in front of 4723 where convenient to the operator. It provides added visibility of the documents as well as adding convenience when feeding them into the 4723.

SUPPLIES

Inscriber Ribbon Cartridge: Provides for inscribing of 50,000 characters (cartridge not shipped with machine). For CMC-7 font order P/N 7033612, for other fonts order P/N 7034580.

Printer Ribbon Cartridge (P/N 7034581): Provides printing of 1 million characters (one shipped with machine).

Stamp Head (P/N 2694539): Specify stamp plate content on IBM form number GX116070 (stamp heads are not shipped with the machine).

Stamp Head with Date (P/N 2694857): Specify stamp content on IBM form number GX11-6070 (Stamp Heads are not shipped with the machine).

Ink Roll: Provides color inking for at least 100,000 stampings (not shipped with machine). The following colors may be ordered: Red P/N 2694875, blue P/N 2694876 or black P/N 2694541.

4730 PERSONAL BANKING MACHINE

PURPOSE

A self-service financial terminal for use in bank lobbies and vestibules, supermarkets, and other shopping and work locations.

Note: Certain features not available in every country. Certain models not available in every country.

MODELS

Model F01: A self-service financial terminal with a basic configuration containing a 480-character 9-inch diagonal display with selection keys, a keyboard consisting of a numeric keypad and function keys with optional overlays and masks, an identification card reader with Track 2, and a 1000-statement capacity statement printer all located in a single console unit positioned to the left of a currency unit. Five currency cartridges plus one for IBM maintenance service are provided with each machine. (Additional cartridges are available as accessories.) Four security keylocks (three groups of registered keys) provide dual custody access to the check and envelope depositories. Dual custody access may also be ordered for the currency unit. In addition, model F01 may be ordered with SNA/SDLC LUO or BSC-3 or BSC-3 with 3276 emulation communications support. The basic configuration includes CNM support, an operational diskette which contains operational microcode providing diagnostics, CSU support, transaction support, and communications support, and a status switch to monitor cover and servicing door openings. Servicing doors are on the front. Customizable panels for the upper rear and upper side of the currency unit are shipped with the machine. They can be removed and repainted. They are also available as accessories for replacement or for early customization before the machine is installed. Special features which may be ordered for the Model F01 include a check depository with a capacity of 300 checks, an envelope depository, and a coin dispenser.

Model F02: A self-service financial terminal with a basic configuration containing two displays with selection keys, two keyboards with optional overlays and masks, two identification card readers with Track 2, and two 1000-statement capacity statement printers located in two console units, one on either side of a single currency unit. Five currency cartridges plus one for IBM maintenance service are provided with each machine. (Additional cartridges are available as accessories.) Seven security keylocks (three groups of registered keys) provide dual custody access to the check and envelope depositories. Dual custody access may also be ordered for the currency unit. In addition, model F02 may be ordered with SNA/SDLC LUO or BSC-3 or BSC-3 with 3276 emulation communications support. The basic configuration includes CNM support, an operational diskette which contains operational microcode providing diagnostics, CSU support, transaction support, and communications support, and a status switch to monitor cover and servicing door openings. Servicing doors are on the front. A customizable panel for the upper rear of the currency unit is shipped with the machine. It can be removed and repainted. It is also available as an accessory for replacement or for early customization before the machine is installed. Special features which may be ordered for the Model F02 include two check depositories with a capacity of 300 checks each, two envelope depositories, and two coin dispensers.

Model R01: Same as the model F01 except that the servicing doors are on the rear and the currency unit customizable panels for the upper front and upper side are shipped with the machine.

Model R02: Same as the model F02 except that the servicing doors are on the rear and the currency unit customizable panel for the upper front is shipped with the machine.

Model F11: Same as the model F01 except that the statement printer has a capacity of up to 1900 statements and the basic configuration includes an identification card reader/encoder with Track 1/2 read and Track 3 read/write, and four status switches to monitor cover

and servicing door openings, open/closed, in-use, and service required status.

Model F12: Same as the model F02 except that the statement printers have a capacity of up to 1900 statements each, and the basic configuration includes two identification card reader/encoders with Track 1/2 read and Track 3 read/write, and seven status switches to monitor cover and servicing door openings, open/closed, in-use, and service required status.

Model R11: Same as the model R01 except that the statement printer has a capacity of up to 1900 statements, and the basic configuration includes an identification card reader/encoder with Track 1/2 read and Track 3 read/write, and four status switches to monitor cover and servicing door openings, open/closed, in-use, and service required status.

Model R12: Same as the model R02 except that the statement printers have a capacity of up to 1900 statements, and the basic configuration includes two identification card reader/encoders with Track 1/2 read and Track 3 read/write, and seven status switches to monitor cover and servicing door openings, open/closed, in-use, and service required status.

Model F51: Same as the model F11 except that the currency unit and depositories area in the console are protected by heavy-duty enclosures with a key and combination lock. The customizable panels for the upper rear and upper side of the currency unit are eliminated. The model F51 basic configuration includes vandal-resistant gates and runoff channels for the check, envelope, identification card reader/encoder, statement, and cash issue openings. The check depository special feature has a capacity of 600 checks.

Model F52: Same as the model F12 except that the currency unit and depositories areas in the consoles are protected by heavy-duty enclosures with a key and combination lock. The customizable panels for the upper rear of the currency unit is eliminated. The model F52 basic configuration includes vandal-resistant gates and runoff channels for the check, envelope, identification card reader/encoder, statement, and cash issue openings. The check depository special features have a capacity of 600 checks each.

Model R51: Same as the model F51 except that the servicing doors are on the rear and the customizable panels for the upper front and upper side of the currency unit are eliminated.

Model R52: Same as the model F52 except that the servicing doors are on the rear and the customizable panel for the upper front of the currency unit is eliminated.

Prerequisites: Attaches to an available position on the Fan-out Communications Adapter of the 4701 Finance Communication Controller or communicates with the IBM 4701 controller via the EIA/CCITT interface. If Host Connected -- a communications controller with appropriate features; see M3704, 3705, 3725, 3727 or 4321/4331/4361 (for Communications Adapter, #1601, on the 4321, 4331 and 4361) pages.

Customer Setup (CSU): Yes.

HIGHLIGHTS

The 4730's modular design and configuring flexibility allow it to be ordered as a low-cost cash issuer, with selected features, or fully featured with its unique new functions. All mdls of the 4730 can be configured to issue currency in up to five denominations plus four denominations of coin; cash checks in the exact amount; validate checks for acceptance by a cashier; stack checks individually for deposit; sequentially stack enveloped deposits in the order they were deposited; and perform other financial transactions including transfers and bill payment; other documents, such as Traveler's

checks, may be dispensed if (via RPQ) they complete a document issue qualification test successfully.

- All models of the 4730 have the following features:
 - Certified for UL 291 Business Hours service
 - Deposit checks without envelopes
 - Verification through MICR reader
 - Audit trail through check printer
 - Sequentially stacked
 - Uneven amount cash back or cash withdraw
 - Accept non-MICR documents option
 - Cash checks in exact amount
 - Up to 5 denominations of currency
 - Up to 4 denominations of coin
 - Check authorization
 - Multiple check deposit with cash back
 - Multiple check cashing
 - Multiple (chained) transactions on a variable length transaction statement
 - Menu selection of transactions
 - Identification card reader with Track 2 read capability
 - Automatic customer-defined reconfiguration
 - Out of currency or coin denomination
 - When component out of service
 - Display, statement printer used for settlement, operator tasks
 - Locally stored image and microcode eliminate need to download after power loss or machine reset
 - Dispense zero-value documents
 - Calculator mode input option (fixed placement of decimal point)
 - BSC-3 support option with selectable 3276 emulation
 - S/34/36/38 SNA/SDLC attach support
 - 4730 host communications when 4730 closed
 - Host phrase changes permanent across IPLs
 - Optional device test for out-of-service devices
 - Host re-IPL command
 - Customer setup
 - Multiple language display capability; based on identifier code recorded on magnetic stripe card
 - Multiple installation usage capability; can accept magnetic stripe cards of many different card issuers.
 - Modular packaging, horizontal configuration, customizable appearance
 - Installation flexibility; free standing or in-counter installation
 - Single or dual consoles; dual consoles share common logic and currency unit providing cost savings
 - Front or rear service; front service for a free-standing installation near a wall, rear service for other free-standing installations or for in-counter installations.
 - Menu-driven service interface
 - Customer servicing activities such as replacing ribbons, replacing paper rolls, emptying depository containers,

etc., can be performed on one console of a dual console 4730 while the other console remains operational.

- Customizable panels; lower panels for all sides but service doors are provided as accessories. (See "Accessories".) The customer can leave the accessory lower panels pearl white, repaint them, or install his own lower panels (wood, veneers, etc.) in place of the accessory panels. Lower panels may not be required for in-counter installation. Upper panels are always shipped with the machine. Certain upper panels can be removed and repainted (mdls F01, F11 - upper rear and upper side; mdls F02, F12 - upper rear; mdls R01, R11 - upper front and upper side; mdls R02, R12 - upper front). If the customer wishes to have custom-finished upper panels available at the time of installation, accessory upper panels can be ordered in advance of machine shipment.
- Dynamic reconfiguration without machine closing; at customer option. Documents: Automatic recovery with documents of same or lower denomination (including substitution of coins for dollars to complete a transaction). Coin: Automatic recovery with coin lower denomination. Check Depository: Automatic recovery using envelope depository. Envelope Depository: Automatically configured out when out of service. Statement Printer: Automatically configured out when out of service. (Consumer option to complete transaction without receipt.)
- Models F11, F12, R11, R12, F51, F52, R51, and R52 have additional features:
 - Identification card reader with Track 1 read and Track 3 read/write capability
 - ▲ lockout gate with magnetic stripe recognition
 - ▲ card eject on power loss
 - ▲ card retain under program control
 - ▲ specify magnetic stripe down card insertion (standard magnetic stripe up)
 - Statement printer capacity increased to 1900 documents
 - Three status switches enable customer to provide open/closed, service required, and in-use indicators
- Models F51, F52, R51, and R52 have features to support use in unattended environments:
 - Heavy-duty enclosures for use in bank vestibules, shopping centers, other shopping and work locations
 - ▲ When shipped from the factory, models F51, F52, R51, and R52 will be listed UL 291 for 24-hour service and the intent of Regulation P for Automated Paying or Receiving Machines
 - ▲ Key and combination locks
 - ▲ Optional penetration detection devices
 - ▲ Heavy-duty enclosures and locks not serviced by IBM
 - Vandal-resistant gates and runoff channels for check, envelope, identification card reader, statement, and cash issue openings
 - Check depository capacity increased to 600 checks

Capacities:

Document cartridge: 2,000 new documents, approximately 1,500 used documents.

(Canada only) > Coin cartridges (average per console): < (Canada only) > 1 - 410; 5 - 360; 10 - 540; 25 - 390. <

Check depository: Models F01, F02, R01, R02, F11, F12, R11, R12: approximately 300. Models F51, F52, R51, R52: approximately 600.

Envelope depository: 325 sealed envelopes each containing an average of three documents.

MACHINES

Statement printer: Models F01, F02, R01, R02: 1,000 3-inch statements using a 3.75-inch o.d. roll of 16-pound paper. Models F11, F12, R11, R12, F51, F52, R51, R52: 1900 3.5-inch statements using a 5.5-inch o.d. roll of 16-pound paper.

Supported currencies and coins include:

Currency	Bills	Coins
(Canada only)		
	1 dollar	1 cent
	2 dollars	5 cents
	5 dollars	10 cents
	10 dollars	25 cents
	20 dollars	
	50 dollars	<)
(A/PG only)		
Australia	2 dollars	
	5 dollars	
	10 dollars	
	20 dollars	
	50 dollars	
Singapore	10 dollars	
	50 dollars	
Thailand	100 baht	
	500 baht	
Malaysia	10 ringgit	
	50 ringgit<)	

An RPQ should be submitted for a document issue qualification test for note denominations not specified above, for traveler's checks, or for other documents. Specify currency denomination or note and issue to be tested.

System Attachment: The 4730 was designed to communicate with any host CPU or subhost capable of communications, via an SDLC line discipline using an SNA LU type 0 protocol, via a BSC-3 line discipline with or without 3276 emulation, or with a 4701 Controller or 4702 Processor via SNA primary attachment. The electrical interface presented by the 4730 complies with EIA Standard RS-232-C.

Local Attachment: For local SNA/SDLC attachment to a 4701 Finance Communication Controller or a 4702 Processor: This attachment requires that the Fan-out Communications Adapter feature #1551, and the SDLC Communications Adapter without Business Machine Clocking feature #4502, be installed on the 4701; or that the Alternate Line Attachment Port feature #3702, and the Fan-out Communications Interface feature #9646, be installed on the 4702. Supported transmission rates are: 2400 bps (122m (400 ft) maximum cable length), 4800 bps (61m (200 ft) maximum cable length), 9600 bps (30m (100 ft) maximum cable length). Refer to "IBM 4700 Finance Communication System Installation Planning", GC31-2018. Cable assembly P/N 6125820 must be ordered from Poughkeepsie, specifying the length required (connectors provided).

Remote Attachment: Remote SNA/SDLC attachment to a host or subhost: Requires the use of modems which are capable of supplying data clocking (see table below). Supported transmission rates are 1200, 2400, 4800, and 9600 bps. For remote attachment to the 4701 Finance Communication Controller, the EIA/CCITT Interface feature #3701, and the SDLC Communications Adapter without Business Machine Clocking feature #4502, are required on the 4701. For remote attachment to the 4702 Processor, the Alternate Line Attachment Port feature #3702 and SDLC RS-232-C interface feature #9645, are required on the 4702.

The 4730 will support Binary Synchronous multipoint, polled, line protocol at line speeds of 1200, 2400, and 4800 baud rates. This attachment requires the use of modems which are capable of supplying data clocking (see table below). The 4730 recognizes the BTAM BSE-3 implementation and the BTAM BSC-3 3276 display device implementation with EBCDIC or USASCII transmission code.

Modem	Speed (bps)	Lines
3833-1	2400	Nonsw voice grade

3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw or Sw voice grade
3864-1,2	4800/2400	Nonsw or Sw voice grade
3865-1,2	9600/4800	Nonsw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3868-3,4	9600/4800	Nonsw voice grade
3872-1(1)	2400/1200	Nonsw voice grade
3976-3(2)	1200/600	Nonsw voice grade
5811-10	2400 to 9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400 to 9600	Nonsw baseband
5811-28		Rack mount version of 5811-20
5812-10	2400 to 9600	Nonsw baseband
5812-18		Rack mount version of 5812-10
5865-2,3	9600/7200/4800	Nonsw voice grade
5868-52		Rack mount version of 5865-2
5979-L41(2)	9600	Limited Distance COAM
(1)	Canada only	
(2)	Except Canada	

Note: 4-wire Switched Network Back-up is available on 3863, 3864, 3865, 5865 and 5868 modems with feature #7953 installed. 2-wire Switched Network Back-up is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch / TP coordinator for country limitations.

External Modem Interface: Provides a 6.1m (20 ft) cable assembly and a V.24 interface for attachment to an external IBM modem or PTT mandatory modem complying with CCITT Recommendation V.24, V.28 ISO Standard 2110 and other relevant CCITT Recommendations. Attachment to non-IBM modems or other DCEs is subject to the provision of the Multiplier Supplier Systems Bulletin.

Cabling: Refer to "IBM 4730 Personal Banking Machine Planning and Site Preparation Guide", GC31-2075, for information regarding the specified length (up to 40 ft) cable assembly and bulk cable. See "Accessories" for ordering instructions.

SPECIFIED OPERATING ENVIRONMENT

Programming Support: The 4730 presents an application interface to host applications designed to process financial transactions and monitor 4730 operations. The 4730 application interface consists of two-message sequences which can be easily handled by CICS/VS and IMS/VS. The application messages consist of fixed-format or variable-format fields containing alphanumeric data which facilitates the development of application programs using high-level languages. These attributes make it possible for the 4730 to communicate with application programs written for a variety of host processors and operating systems.

If the 4730 is communicating with a S/370, 30XX, or 43XX series processor, existing programming support in VTAM, BTAM, and NCP can be used. User-written 4730 application programs running under CICS/VS or IMS/VS can communicate with host attached 4730s through existing CICS or IMS communications facilities. CICS or IMS support for communicating between the host and the 4701 Finance Communications Controllers or the 4702 Processor may be used when the 4730 is attached to a 4701 or 4702. Programming support for communications between the 4701 or 4702 and the 4730 is a customer responsibility.

Application Program Products

- 4730 Personal Banking Machine:
 - Customization Image Builder, 5668-870
 - Network Monitor, 5668-871
 - Availability Management - Batch Reporting, 5668-873
 - Remote Network Monitor, 5668-872
- and the 4700 Finance Communication System Host Support, 5668-989

Customer Responsibilities: The customer is responsible for:

1. Assuring that use of the equipment complies with all laws, regulations and ordinances.
2. Adequate site, system, and other vendor preparation.
3. Price quotations, installation, and cost (initial and recurring) of common carrier equipment and service.
4. Receipt at the customer's receiving dock, unpacking, and placing of the 4730.
5. Physical setup, connection of cables in protected customer-access areas.
6. Performing 4730 checkout in accordance with supplied procedures for initial installation or relocation.
7. Creating the customization image and loading it onto the operational diskette.
8. Checking communications with the 4701 controller or with the host processor.
9. Developing and/or obtaining and installing application programs to communicate with the 4730.
10. Using the problem determination procedures provided with the IBM 4730 to determine the failing component and filling out the appropriate 4730 Trouble Report prior to requesting on-site maintenance service (see "Maintenance" below).
11. Notifying IBM of machine relocation for IBM maintenance coverage.
12. Procuring and replacing replacement ink ribbons for the statement printer and the check printer, and replacement paper rolls for the statement printer. Ink ribbons and paper rolls are available; see "Accessories".
13. Procuring any spare or replacement accessories.
14. Procuring maintenance service for any spare or replacement locks.
15. Procuring maintenance service for heavy-duty enclosure.

Maintenance: Maintenance of the 4730 is available under the IBM Maintenance Agreement.

IBM will not provide warranty or maintenance service on a 4730 containing money. The customer will be responsible for removing, controlling, and reloading all money in the 4730 so that IBM can fulfill its warranty and maintenance obligations. A service document cartridge is supplied with the basic machine, and a service coin cartridge is supplied with the coin feature. These cartridges are intended for use in customer problem determination and by the IBM service representative for servicing the 4730.

Customers with 4730s not covered by IBM Maintenance Agreements may have the unit(s) repaired, if repairable, on-site for a time-and-material charge.

If maintenance coverage is not contracted for immediately following expiration of any warranty and the customer subsequently wants IBM Maintenance Agreement coverage, the

customer must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined. This qualification will be done at the customer's site. If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs is billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Accessories are not maintained by IBM.

Currency Unit Operation

Document Cartridges: Five document cartridges are provided with the basic 4730 for customer use. An additional service document cartridge is provided for use by IBM service representatives. Additional cartridges for use as spares or replacements may be ordered. Spare cartridges permit the customer to fill some with currency while other cartridges are in use. The customer is responsible for determining if the cartridge is the failing unit within a 4730. (Except LAD> Failing document cartridges should be replaced; the document cartridge was not designed to be repaired. Service for the document cartridge under the IBM Maintenance Agreement is not offered.<) The service document cartridge must be made available by the customer to the IBM service representative for normal 4730 maintenance.

Use new or used currency in good condition: The general condition of used currency may vary. Used currency must be inspected to remove excessively worn, damaged, or torn bills. The "4730 Personal Banking Machine Operator's Guide for Front-Serviced 4730s", GC31-2518, and the "4730 Personal Banking Machine Operator's Guide for Rear-Serviced 4730s", GC31-2520, contain procedures for preparation of new currency and inspection of used currency for operation in the 4730.

(Canada only > Coin Cartridges: Each 4730 coin cartridge is used to hold one denomination of coins. Four coin cartridges are provided with the feature for customer use. An additional service coin cartridge capable of holding multiple denominations is provided for use by IBM service representatives. Additional cartridges for use as spares or replacements may be ordered. Spare cartridges permit the customer to fill some with coins while others are in use. The customer is responsible for determining if the cartridge is the failing unit within a 4730.<) (Canada only > Failing coin cartridges should be replaced; the coin cartridge was not designed to be repaired. Service under the IBM Maintenance Agreement is not offered.<) (Canada only > The service coin cartridge must be made available by the customer to the CE for normal 4730 maintenance.

Use new or used coins in good condition: The general condition of used coins may vary. Used coins must be inspected to remove excessively worn or damaged coins. The "4730 Personal Banking Machine Operator's Guide for Operator's Guide for Rear-Serviced 4730s", GC31-2520, contain procedures for inspection of used coins for operation in the 4730.<)

SPECIFY

- Voltage: Country code specifies voltage and line cord. All Models: 115-120V AC, 1-phase, 60 Hz. Models F01, F02, R01, R02 only: 220-240V AC, 1-phase, 50 Hz.
- (Canada only > 120V (usable on 115V) AC, 1-phase, 60 Hz.<) (Except Canada > 240V AC, 1-phase, 50 Hz.<)
- Machine Nomenclature:

Canadian English	#2934
Canadian French	#2935
English US	#2924
- (A/PG only > Currency Cartridges: Specify currency cartridges to be delivered with machine. Maximum: Six (five operating cartridges plus one service document cartridge).

- Magnetic stripe down identification card reader/encoder: Default orientation of all 4730 identification card readers and card reader/ encoders is magnetic stripe up. Specify #9540 for identification card reader/encoder orientation magnetic stripe down. Maximum: One. Limitations: Not available with mdls F01, F02, R01, R02. Field Installation: Yes.
- Dual-Custody Keylock: Specify #9550 for a second keylock provided for the currency unit. Maximum: One. Limitations: Not available with mdls F51, F52, R51, R52 or with RPQ 8V0290. Field Installation: Not recommended.
- Communications line discipline: Default communications for all 4730s is SDLC without business machine clock. Specify #9502 for SDLC communications without business machine clock. Specify #9522 for BSC communications without business machine clock. Maximum: One. Field Installation: Yes.
- Keyboard Overlays (Numeric or Alphameric Key Arrangement): For each of the standard keyboards displayed below: Specify #9301 for numeric-only keypad; Specify #9302 for alphameric keypad (alphameric arrangement is the basic touch-pad telephone format with the Q and Z added over the numeric "0" and no alpha over the numeric "1"), or specify #9303 for alphameric keypad (alphameric arrangement is the American Banking Association Standard format with the Q and Z over the numeric "1" and no alpha over the numeric "0").
- Function Key Arrangement: Specify one of the following function key arrangements. (Except LAD>Service for keyboard overlays under the IBM Maintenance Agreement is not offered.<)

SPECIAL FEATURES

Maintenance: Service for 4730 Special Features is offered under the IBM Maintenance Agreement.

Note: All field installable special features require service personnel for field installation.

Field Installable:

(Except LAD> Check Depository (#1550): Provides a check transport mechanism leading from a check slot to a MICR check reader, a check printer, and a container with a capacity of approximately 300 checks (600 checks with models F51, F52, R51, R52). One container per Check Depository is supplied with the feature. Additional containers are available as an accessory. Handles checks between 66.7mm (2.63 in.) and 108.0mm (4.25 in.) wide and between 146.1mm (5.75 in.) and 225.4mm (8.9 in.) long and between 0.09mm (0.0035 in.) and 0.18mm (0.007 in.) thick with a base weight of between 20 and 32 pounds (75 and 120 grams per square meter). The check printer will print up to 55 characters (45 characters when check authorization is implemented) of customer selected information on the check to aid reconciliation and return item processing, or to provide

data for check authorization. This information will be printed in a multiple field single line across the face of the check. The check will be printed after the check has been accepted for stacking or authorization and returned to the customer. The checks will be stacked in sequence in a container which is transportable and spill-proof. Check containers are not covered under the IBM Maintenance Agreement. Limitations: One per mdl F01, R01, F11, R11, F51, or R51; two per mdl F02, R02, F12, R12, F52, or R52. Field Installation: Yes.<)

(Canada only> Coin Dispenser (#1650): Transports coins from four denomination-specific coin cartridges to a coin cup located in the currency unit; four coin cartridges per Coin Dispenser are provided with the feature for customer use. An additional service coin cartridge capable of being installed in any position in the coin dispenser is provided for use by IBM service representatives. Additional coin cartridges are available as an accessory. Coin cartridges are not covered under the IBM Maintenance Agreement. The approximate coin capacities for the 4730 mdls F01, R01, F11, R11, F51, and R51 and each station of a mdl F02, R02, F12, R12, F52, and R52 are: <) (Canada only> 1 - 410; 5 - 360; 10 - 540; 25 - 390.<) (Canada only> Limitations: One per mdl F01, R01, F11, R11, F51, or R51; two per mdl F02, R02, F12, R12, F52, or R52. Field Installation: Yes.<)

Envelope Depository (#3650): Provides an envelope transport leading from a controlled access slot to a deposit receptacle inside the 4730. The depository transport is designed to discourage tampering with previously inserted deposits. The deposited envelopes are stacked in a portable container in sequence. The depository will accept sealed envelopes up to 12.7mm (0.5 in.) thick. It will accept the normal (maximum) size envelope for the US and Canada which is 107mm (4.2 in.) by 241mm (9.5 in.). The envelope depository will accept 325 sealed envelopes each containing an supplied with the feature. Additional containers are available as an accessory. Envelope containers are not covered under the IBM Maintenance Agreement. Limitations: One per mdl F01, R01, F11, R11, F51, or R51; two per mdl F02, R02, F12, R12, F52, or R52. Field Installation: Yes.

Penetration Detection Devices - Currency Unit (#3450): Provides a seismic detector and door grid for the currency unit heavy-duty enclosure; can be connected to a customer-provided alarm system. Prerequisites: Model F51, R51, F52, R52, or RPQ 8V0290. Limitations: One per machine. Field Installation: Yes.

Penetration Detection Devices - Console (#3460): Provides a seismic detector and door grids for the depositories heavy-duty enclosure; can be connected to a customer-provided alarm system. Prerequisites: #3450. Limitations: One per model F51 or R51; two per model F52 or R52. Field Installation: Yes.

(LAD only) Customer Setup CSU

Note: CSU special features are available on a purchase-only basis. Order by part number through < > (LAD only) your Country DP Supplies Coordinator. < > (LAD only) Customers planning to order large volumes of CSU special features should contact < > (LAD only) their Country DP Supplies Coordinator < > (LAD only) at least 120 days prior to installation. All CSU special features can be installed by the customer.

Document Cartridges: Document cartridges hold currency or documents for dispensing by the document dispenser. The cartridges are constructed of high impact plastic, are sealable, and are self-closing when removed from the document dispenser. A full complement of five document cartridges is provided with each machine for customer use. An additional service document cartridge is provided for use by IBM service representatives. Additional cartridges for use as spares or replacement may be ordered by part number.

P/N	Document Cartridge Description
6130541	U.S.<

(LAD only) Envelope Container: The envelope container receives and holds envelopes deposited via the Envelope Depository feature. It is constructed of 2.5mm diecast aluminum with a sealable door. The container contains a spring-loaded pressure plate to insure that deposited envelopes retain the original deposit sequence. Envelopes can be removed from the container without removing the container from the machine. Alternatively, the container can be removed from the machine for secure transportation to another location for processing. Each Envelope Depository feature uses one container which can hold up to 325 sealed envelopes each containing an average of three documents. One envelope container is provided with each Envelope Depository feature. Additional containers for use as spares or replacement may be ordered by part number.

MODEL CONVERSIONS

The following field upgrades are supported:

- Model F01 to Model F02
- Model R01 to Model R02
- Model F11 to Model F12
- Model R11 to Model R12
- Model F51 to Model F52
- Model R51 to Model R52

All other model changes available at time of manufacture only. Model upgrade orders must include additional feature orders for each feature already installed. MES orders for field installation of new features must be placed separate from model upgrade orders.

ACCESSORIES

Accessories are available on a purchase-only basis. Order by part number through your Country DP Supplies Coordinator. Customers planning to order large volumes of accessories should contact their Country DP Supplies Coordinator at least 120 days prior to installation.

Warranty: All accessories are warranted free from defects in materials and workmanship for three months. IBM's obligation is limited.

ited to providing replacement parts on an exchange basis during the warranty period.

Maintenance: Service for IBM 4730 accessories under the IBM Maintenance Agreement is not offered.

(Except LAD> Document Cartridges: Document cartridges hold currency or documents for dispensing by the document dispenser. The cartridges are constructed of high impact plastic, are sealable, and are self-closing when removed from the document dispenser. A full complement of five document cartridges is provided with each machine for customer use. An additional service document cartridge is provided for use by IBM service representatives. Additional cartridges for use as spares or replacement may be ordered by part number.

P/N	Description
6130549	Envelope Container

(Except LAD> Check Container: The check container receives and holds checks deposited via the Check Depository feature in the order they were deposited. Each Check Depository feature uses one container, which can hold up to 300 checks in a mdl F01, R01, F02, R02, F11, R11, F12, or R12, and up to 600 checks in a mdl F51, R51, F52, or R52. The check container is provided with a cover for use in

transporting checks to another location for processing. One check container is provided with each Check Depository feature. Additional containers for use as spares or replacements may be ordered by part number.

P/N	Description
6130550	Check Container - 300 checks
6050452	Check Container - 600 checks<)

Customizable Bezels: Each 4730 is provided with bezels with standard graphics for each identification card reader, envelope depository feature, and check depository feature. Each statement printer is provided with a bezel without graphics. Bezels without graphics can be ordered by part number as accessories. This allows the customer to customize his graphics on the bezels through silk screening or decals. The customer should not attempt to remove any standard bezel before reading the set up instructions for the customizable bezel.

P/N	Description
6125777	Customizable Card Reader Bezel - mdls F01, R01, F02, R02
6167639	Customizable Card Reader Bezel - mdls F11, R11, F12, R12

6050468	Customizable Statement Printer Bezel - mdls F51, R51, F52, R52

Customizable Panels: All 4730 panels and service doors provided by IBM are finished in pearl white. Service doors are provided with the 4730 but lower panels, if required, must be ordered by part number as accessories. The customer can leave the accessory lower panels pearl white, repaint them, or install his own lower panels (wood, veneers, etc.) in place of the accessory panels. Lower panels may not be required for in-counter installation. Upper panels are always shipped with the machine. Certain upper panels can be removed and repainted (mdl F01, F11 - upper rear and upper side; mdl F02, F12 - upper rear, mdl R01, R11 - upper front and upper side; mdl R02, R12 - upper front). If the customer wishes to have custom-finished upper panels available at the time of installation, accessory upper panels can be ordered in advance of machine shipment.

Lower customizable panels can be ordered individually or grouped in panel assemblies for each model. Models F01, F02, F11, F12, F51, and F52 panel assemblies contain lower rear and side panels. Models R01, R02, R11, R12, R51, and R52 panel assemblies contain lower front and side panels. All customizable panels are provided with mounting hardware. Mounting hardware is also available separately as an accessory for mounting panels that the customer provides. Orders for customizable panels and mounting hardware should be submitted early enough to allow the customer to obtain customized panels to installation of the 4730. When an upper panel is ordered early (as an accessory), the customer will have to replace the standard panel that is always shipped on the 4730 with the one he has customized.

4731 PERSONAL BANKING MACHINE

PURPOSE

The 4731 Personal Banking Machine is a cash issuing machine designed for through the wall, vestibule and off-bank installations (e.g. convenience stores, supermarkets, railway stations, etc.).

MODELS

Model BH1: Consists of one feed module, an IBM-provided hardened enclosure (UL-291 level safe which complies with the intent of U.S. Federal Regulation P for unattended operation) and the required logic and consumer interface elements to perform banking oriented transactions.

Model BO1: Consists of one feed module, attachment capability for installation into a non-IBM-provided safe and the required logic and consumer interface elements to perform banking oriented transactions.

Maximum: The maximum number of feed modules is four.

Prerequisites: Remote attachment to a host or subhost. This attachment requires the use of modems which are capable of supplying data clocking.

For SDLC communications, supported transmission rates are 1,200, 2,400, 4,800 and 9,600 bps. For remote attachment to the 4701, the EIA/CCITT interface #3701 and the SDLC Communication Adapter Without Business Machine Clocking feature #4502 are required. The A.L.A. port feature #3702 and SDLC Communications Adapter Without Business Machine Clocking feature #4502 are required on the 4702.

For BSC 3 communications, supported transmission rates are 1,200, 2,400, 4,800 and 9,600 bps.

Local attachment to a 4701 requires the Fanout Communications Adapter feature #1551 and the SDLC Communications Adapter Without Business Machine Clocking. Local attachment to a 4702 Branch Processor requires the A.L.A. port feature #3702. Supported transmission rates are 2,400 bps 122m (400 ft.) maximum cable length, 4,800 bps 61m (200 ft.) maximum cable length and 9,600 bps 30m (100 ft.) maximum cable length.

B-Loop attachment to an IBM 4701. The 4731 may be attached locally to the 4701 or it may be remotely attached. If the 4731 is attached remotely, modems such as the 3863, 3864, 3865, or the equivalent, are required. The Terminal attachment unit 3603 may also be used. The Remote Terminal Attachment Unit 5989-B01 can be used for remote attachment.

Customer Setup (CSU): Model BH1 is customer setup.

HIGHLIGHTS

The 4731 provides a wide range of self-service banking services including cash withdrawals, account balance enquiry, and funds transfers between accounts. In addition, other applications may be implemented by the banks. In the design of the 4731, particular attention has been paid to physical size, appearance, human factors, ergonomic and privacy aspects. The 4731 functions include:

- Consumer Guidance from display (480 characters)
- Selection keys using the display for prompting
- Keyboard input (numeric and function keys)
- Selectable and adjustable audible feedback for keyboard entries
- Track 1 card read (IATA Standards)

- Track 2 card read (ABA and ISO standard)
- Track 3 card read/encode (ABA and ISO standard)
- JUCC read (Japanese Universal Credit Card Reader)
- PIN Validation within 4731 (application/service dependent)
- Cash issuing (up to four denominations)
- Receipt/Statement printing
- SDLC/SNA to host communication
- BSC 3 to host
- 4700 B-Loop attachment
- SDLC/SNA primary attachment to 4701/4702
- Card eject at power failure (return magnetic stripe card to user)
- Card capture (program controlled)
- Card retract of forgotten cards
- Money retract into separate bin
- Account balance enquiry
- Funds transfer from/to account
- Deliver money and receipt together at the same gate
- Menu driven transaction types
- Customized bank transactions
- Card Processing Table
- Financial institution tables for multi-bank ATM network
- Transaction chaining
- Encryption/Decryption
- Support of ECI functions in Germany/Austria.
- For Germany, a 5977 or equivalent at the host is required to do the transaction transformation from the 4731 format to the ECI format and vice-versa. The 5977 is a BSC terminal and needs the appropriate system/host support. It is the customer's responsibility to provide the application software for the 5977.
- The 4731 provides support for the language selection step, PIN entry and amount selection for ECI transactions.
- For ECI function in Austria, the "Austrian Split PIN Base" function for PIN calculation is supported.
- The support of the German private banks authorization procedure requires a 5977 or equivalent at the host to do the transaction transformation from the 4731 format to the private banks format and vice-versa. The 5977 is a BSC terminal and needs appropriate system/host support. The customer is responsible for providing the application software for the 5977.
- Cash low, cash out, printer forms low and printer forms out to host
- Dynamic reconfiguration within 4731
- Communication Network Management (CNM support)
- Provision to install the MM security system
- Model BH1 with UL-291 Safe and five sided alarm grid and dual custody Lock
- Model BO1 with provision to install into a non-IBM safe (80mm top side)

- Large character display
- Separate Operator/CE Panel
- Customer Setup (CSU) for Model BH1
- Support of major languages on printer and display
- Support of major currency notes

Standard Features:

Document Feed Mechanism: Each base model contains a document feed mechanism with one Feed Module. The number of notes dispensed to satisfy a cash withdrawal is under program control. A Currency Cartridge (available as an accessory) is installed into a Feed Module. Two different types of Currency Cartridges are available.

- **AA: Non-Locking Currency cartridge:** This cartridge provides the capability to secure the contents by the use of seals, either wire or plastic. Once the cartridge has been properly sealed, the cartridge contents cannot be removed without first removing the seal. The seal must be removed before inserting the cartridge in the Document Feed Mechanism of the 4731. If the seal is not installed, the cartridge can be easily opened without using tools or the cartridge loading frame.
- **BB: Electronically Locked Currency Cartridge:** This cartridge has an electronic lock and can only be opened by using the loading frame.

Both cartridges automatically identify their note denomination to the 4731 and a cartridge can be loaded in either of the four feed modules (three additional feed modules are available as special features). Notes will be delivered to the user of the 4731 in a bundle, containing up to a maximum of 20 notes. Rejected notes are fed to an Electronically Locked Rejected Note Cartridge which can hold approximately 300 notes. One Rejected Note cartridge is shipped with the 4731. In addition to the electronically locked rejected notes cartridge, a Non-Locked Rejected Note cartridge will also be available. This cartridge provides the optional capability to secure the contents by the use of seals, either a wire or plastic. Once the cartridge has been properly sealed, the cartridge contents can not be removed without first removing the seal. The seal must be removed before inserting the cartridge into the 4731. If the cartridge seal is not installed, the cartridge can easily be opened without using tools or the Cartridge Loading Frame.

If a receipt is generated with the cash oriented transaction, it is delivered with the notes together at the same gate. If, for some reasons, the delivered money and receipt are not taken by the customer from the cash gate, a programmable MONEY RETRACT operation takes place and retracts the complete bundle into a separate money retract bin. It is the application programs decision to keep the 4731 in service or close it for reconciliation purposes. The Cartridges must be ordered as accessories. The stack height of the Currency Cartridge is 235mm (9.25 in.). The feed cartridges are exchangeable with those already announced for the 4733 and the 4736.

Consumer Display: The 4731 consumer display is a 9-inch diagonal positive image display (black characters on white background) which has a 480 character capacity (12 lines each 40 characters). The location and positioning of the display provides a maximum protection from observation of information displayed by anyone other than the current user. A limited-angle privacy viewing filter is provided as a standard feature. The filter prohibits viewing the display from a side angle. The viewing angle is limited to 24 degrees on either side of the center of the screen. The display and the filter are covered by safety glass and protect the display against vandalism.

Languages supported by the display include English, Western European languages, Chinese, Hangeul, Thai, Hebrew and Arabic. For APG countries, large character fonts are available for the display in support of Chinese and Hangeul (in this case only 128 characters can be displayed on a screen). Support for large characters fonts on the 4731 display is provided as standard in the following

countries: Korea, Hong Kong, Indonesia, Malaysia, Singapore and Taiwan.

The 4731 9-inch positive image display can be used to display graphics symbols. The screen may contain text, pictures or a combination of both. The pictures may be subdivided into smaller elements and fragments. These elements can be used to build up a complete screen. "STORYBOARD" PC work station tool or equivalent program is used to create the picture elements and save it on a diskette. A PC program takes the pictures from the "STORYBOARD", assigns an ID number, compresses the files and saves it into a "Picture Library". The Picture Library resides on the 4731 diskette. The display messages which builds up the screen, consists of a Standard Character String (SCS) containing the text, picture IDs and the position of the picture. The display messages can be generated by using the CIB or equivalent or it can be transmitted from the host within a Transaction Data Record Response (TDRR).

Consumer Keyboard: The 4731 consists of a 12-key position numeric key block and a 4-key position function key block. The numeric key block can be arranged either in the Telefon or in the Calculator lay-out. The bottom rightmost key contains the "decimal point". The function key block consist of (from top to bottom): CANCEL - red, CORRECTION - yellow, CHANGE - orange, ENTER - green. A set of display selection keys (4 + 4) is provided adjacent to the sides of the display. The display can provide prompting messages for each of the eight display selection keys, and the customer can optionally use the keys for making selections in addition to the function/numeric keys.

A selectable and adjustable AUDIBLE feedback is provided for each key stroke.

Credit Card Reader/Encoder: The credit card reader/encoder on the 4731 provides for track 1 read, track 2 read, and track 3 read/write. Tracks 2 and 3 will adhere to ABA and ISO standards, Track 1 adhere to IATA standards. The card reader also supports the JUCC (Japanese) magnetic stripe standard. The card reader ejects/returns a card to the user upon power failure. A lockable card cartridge is available for holding those cards which are captured (retained) or retracted during normal operation. The lockable card cartridge can not be removed from the reader while locked. Card capture and card retract (forgotten cards) is done under program control. Mounting of the reader provides the option to insert either magnetic stripe up or magnetic stripe down (one only at a time). The 4731 will be shipped with "magn. stripe up" orientation. Conversion in the field from one orientation to the other may be done very easily by the customer in the field. A pictogram of a credit card sample is provided to show proper insertion of the credit card. For user convenience and additional environmental protection, the reader positioning is in an inclined orientation in a way that inserted objects will fall out by own gravity. In addition the card reader has a lockout device which is normally closed. At time of card insertion a sensor device recognizes the presence of the magnetic stripe and it also checks the width of the card. If the correct dimension is detected, the card is then automatically fed into the reader for processing. The lockout gate closes for the duration of the transaction.

MM Security Box Provision: For those countries using the MM box, an attachability is provided on the 4731.

Operator/CE Panel: A separate Operator/CE panel is available at the rear of the machine. The panel consists of a 9-inch monochrome display with 4 + 4 selection keys and a 12-key position keyboard. This panel is used by the operator as well as by the CE for all service activities.

Standard Bezel: For complete installation, the 4731 is delivered with a standard Bezel. Size of the Bezel is: 883mm (34.75 in.) width and 813mm (32 in.) height.

COMMUNICATIONS

One communication feature is part of the standard machine and must be selected at time of order.

4700 B-Loop Attachment: This feature will allow the 4731 to be attached locally or remotely to a 4701/4702 Branch Processor. For local B-Loop attachment, the customer will be instructed to provide the appropriate attachment cable (see "IBM 4731 Planning and Site Preparation Guide", GA19-5347). Included with this feature is a 12m (40 ft.) cable which will support attachment of the 4731 to an external modem for remote B-Loop communication.

The 4731 can also be attached remotely via the 5989-B01 to the 4701 and the 4702. If the 4731 is attached remotely to a 4701 or a 4702, an IBM modem or the equivalent is required (see table for "External Modems").

SNA/SDLC Communications: With this feature, SNA/SDLC attachment is provided in the following modes: A 12m (40 ft.) cable assembly will be provided for remote attachment of the 4731 to a 4701 Branch Processor, or to a 4321/4331 communication adapter, or to an IBM/370, 303X, 308X, 309X or 9370 via an IBM communications adapter (e.g. 3704, 3705, 3725, 3726).

Note: For remote attachment to the 4701, the EIA/CCITT interface feature #3701, and the SDLC Communications Adapter Without Business Machine Clocking, feature #4502, are required on the 4701. For remote attachment to the 4702, the Alternate Line Attachment Port Feature #3702 and the SDLC RS 232-C interface feature #9645 is required on the 4702. Supported transmission rates for remote SNA/SDLC communications are 1,200, 2,400, 4,800 and 9,600 bps. This attachment requires an IBM modem or equivalent. (See table below.)

This feature also supports local SNA/SDLC attachment to an 4701 or a 4702. The Fanout Communications Adapter feature #1551 and the SDLC Communications Adapter Without Business Machine Clocking, feature #4502, must be installed on the 4701. The Alternate Line Attachment Port feature #3702 and the Communications Interface Feature #9646 must be installed on the 4702. Supported transmission rates are 2,400 bps (120m maximum/400 ft. cable length), 4,800 bps (61m maximum/200 ft. cable length) and 9,600 bps (30m maximum/100 ft. cable length). Limitation: 4701 Model 3 only. 4702.

BSC 3 Communication: This feature supports Binary Synchronous multi-point, polled line protocol at a line speed of 1,200, 2,400, 4,800 and 9,600 bps. The 4731 will recognize the BTAM BSC 3 implementation and the BTAM BSC3 3276 display device implementation with EBCDIC or USASCII transmission code. This attachment requires an IBM modem or equivalent. A 12m (40 ft.) cable assembly for attachment to an external modem will be provided with the BSC III communication adapter. The communication features are field installable.

Optional Features:

- 2nd, 3rd and 4th Feed Module
- Receipt/Statement Printer
- Diskette Audit Journal
- Extended Keyboard (plus 16 keys)
- External Contacts
- Digital Camera Interface
- Envelope Depository
- Sequence Printer
- MM box attachment feature

DESCRIPTION

The 4731 is a Self Service Cash Dispenser which automates a wide range of financial services and teller activities, including cash withdrawal, account balance inquiry and funds transfers between accounts, as well as other applications which can be implemented by the customer. In addition to offering services on bank interior premises like vestibules, the 4731 will satisfy the emerging requirements for outdoor, off-bank premises installations in such locations as airports, railway stations, work stations and supermarkets. The 1 to 4 denomination machine is serviced from the rear. The 4731 may be installed in vestibules (into an interior wall) or it may be installed in exterior applications where it would be exposed to the weather. The hardened enclosure provides security in non-bank

environments as well as in bank environment for unattended operations. The currency dispensing mechanism and the control logic are both contained in the safe. Particular attention has been paid to human factors, user privacy, outside appearance and physical size. Focus has been given to accommodating the various types of physical, customized installations.

The Models BH1 and BO1 have gates at the console level to protect the cash/receipt issue areas against the insertion of foreign objects. The design of the 4731 also protects against adverse effects from spilling of liquid on the user console area. The whole user area is highly protected against vandalism.

The Model BH1 contains a penetration alarm grid with contact pins for interfacing with a security alarm system. The alarm grid protects five sides of the Document Feed Mechanism enclosure. The bottom of the enclosure is not protected by the alarm grid.

The Model BO1 provides mounting hardware for easy installation of the 4731 subassembly into a non-IBM-provided safe. Supported wall thickness of the top cover of the non-IBM safe is 80mm (3.15 in.). Please refer to the "IBM 4731 Personal Banking Machine Model BO1 Security Enclosure Attachment Information" manual and the "Planning and Site Preparation Guide" for the 4731 for details about the non-IBM safe and installation requirements.

The 4731 uses the DES (National Bureau of Standards) algorithm for encryption and decryption of secret and sensitive data/information entering and leaving the 4731 on the communication facility. The DES hardware and related storage is within the safe.

A diskette drive for a 1.2MB diskette is included within the 4731 Model BH1 and Model BO1. The diskette is used for the storage of the microcode and images which characterize the operation of the machine.

The 4731 continuously monitors its devices to detect abnormal or exception conditions and reports such events to the host via special messages. If an error is detected during an operation, certain operations are retried a predetermined number of times. If unsuccessful, the function is terminated and the host and controller is notified. Recovery may require service and/or repair actions. All detected errors are logged for use by the institution in service history reporting. Under program control the user can instruct the 4731 to continue operations even when certain features not operating, e.g. receipt printer out of paper, one currency cartridge out of notes, etc. The 4731 can display different languages based on the identifier code recorded on the customer's magnetic stripe card, or based upon consumer selections made via the display. A maximum of four languages can be selected by the customer for any 4731. Languages supported on the 4731 are:

- Canadian English
- Canadian French
- Danish
- English US
- English UK
- Finnish
- French
- German
- Italian
- Spanish
- Netherlands
- Norway
- Sweden
- Arabic
- Hebrew
- Brazil Portuguese
- Hangeul
- Thai
- Chinese

The machine is equipped with a customizable logo panel. This panel is illuminated by two parallel wired fluorescent tubes. Tubes can easily be changed from the inside and are available at regular stores. An illuminated open/closed pictogram informs the user of the 4731 whether the machine is open or closed for the consumer. While the machine is in service, all apertures to the user area are closed and cannot be accessed by anyone from outside.

Physical Specifications:

Width: 851mm (33.5 in.)
Depth: 1,300mm (0.51 in.)
Height: 1,515mm (0.60 in.)
Weight: 743kg (1,641 lbs.)

Note: Above specifications are given for Model BH1 (UL Safe). The weight specifies a 4 FM machine with full cartridges installed plus the Receipt/Statement printer.

Complete dimensions and weight for Model BO1 depends on the size and weight of the non-IBM safe.

Operating Environment:

Inside:

Temperature: 10 to 40 degrees C (50 to 104 degrees F)
Relative Humidity: 8% to 80%
Maximum Wet Bulb: 27 degrees C (80 F)

Outside:

Temperature: -35 to 60 degrees C (-31 to 140 degrees F)
Relative Humidity: 5% to 100%
Maximum Wet Bulb: 29 degrees C (85 F)

Customer Responsibilities: The customer is responsible for:

1. Assuring that use of the equipment complies with all Country, State and local laws, regulations, ordinances, etc.
2. Adequate site, system and other vendor preparation.
3. Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
4. Receipt at customers receiving dock, unpacking and placing of the 4731.
5. Physical setup, connection of cables in protected customer-access areas (Model BH1).
6. Procurement, installation and attachment of all non-IBM devices controlled by the External Contact Feature.
7. Procurement, installation and attachment of non-IBM camera and associated equipment controlled by the Camera Interface Feature.
8. Providing application programs to process Diskette Journal data on an IBM PC AT (or compatible devices).
9. Making available a currency cartridge and a cartridge loading frame (if electrical locked cartridges) for installation and maintenance.
10. Performing 4731 checkout in accordance with supplied procedures for initial installation or relocation (Model BH1).
11. Creating the customization image and loading it onto the operational diskette.
12. Checking communications with the 4701/4702 controller or with the host processor.
13. Using the problem determination procedure provided with the 4731 to determine the failing component and filling out the appropriate 4731 Trouble Report prior to requesting on-site maintenance service.
14. Notifying IBM of machine relocation for field service coverage.
15. Procuring and replacing replacement ink ribbons and Receipt/Statement forms for the receipt/statement printer. Ink ribbons are available from IBM.
16. Procuring any spare or replacement accessories.
17. Procuring non-IBM safe for 4731 Model BO1 and making provisions to have model BO1 installed in non-IBM safe.
18. If "MM security provision" is to be used, customer is responsible for procuring the MM hardware from vendor.
19. Cabling for 4700 B-Loop is under customer's responsibility.

Customization: The Enclosure of the 4731 Model BH1 as shipped, will be pearl white. The Front Panel as shipped will be shadow grey and the Bezel as shipped will be cloud white. As an accessory, the customer can order in advance to the delivery of the 4731 an unprinted silk screened logo panel for his own customization.

SPECIFY

At order time for the 4731, the customer must specify the type of Keyboard and type of Document Reject Cartridge that must be shipped with the machine.

Keyboard type:

- SC9301 Consumer Keyboard Telephone layout, decimal point
- SC9302 Consumer Keyboard Calculator layout, comma
- SC9303 Consumer Keyboard Telephone layout, comma
- SC9304 Consumer Keyboard Calculator layout, decimal point

Document Reject Cartridge type:

- SC9000 for Electronically Locked rejected note cartridge
- SC9001 for Non-Locking rejected note cartridge

Alternate Languages:

- SC2923 for Dutch
- SC2924 for US English
- SC2927 for UK English
- SC2928 for French
- SC2929 for German
- SC2931 for Spanish
- SC2932 for Italian

SPECIAL FEATURES

One of the following three special features for communications must be ordered with a 4731:

- Feature Code #3005 SNA/SDLC Communication
- Feature Code #3010 4700 B-Loop Attachment
- Feature Code #3035 BSC III Communication

SNA/SDLC Communications (#3005): With this feature, SNA/SDLC attachment is provided in the following modes: A 12m (40 ft.) cable assembly will be provided for remote attachment of the 4731 to a 4701, or to a 4321/4331 communication adapter, or to an IBM/370, 303X, 308X, 309X or 9370 via an IBM communications adapter (e.g. 3704, 3705, 3725, 3726).

Note: For remote attachment to the 4701, the EIA/CCITT interface feature #3701, and the SDLC Communications Adapter Without Business Machine Clocking, feature #4502, are required on the 4701.

For remote attachment to the 4702, the Alternate Line Attachment Port Feature #3702 and the SDLC RS232-C interface feature #9645 is required on the 4702. Supported transmission rates for remote SNA/SDLC communications are 1,200, 2,400, 4,800 and 9,600 bps. This attachment requires an IBM modem or equivalent (see "external modems" below).

This feature also supports local SNA/SDLC attachment to an 4701 or a 4702. The Fanout Communications Adapter feature #1551 and the SDLC Communications Adapter Without Business Clocking, feature #4502, must be installed on the 4701. The Alternate Line Attachment Port, feature #3702, and the Communications Interface Feature #9646 must be installed on the 4702. Supported transmission rates are 2,400 bps (120m maximum/400 ft. cable length), 4,800 bps (61m maximum/200 ft. cable length) and 9,600 bps (30m maximum/100 ft. cable length). Limitations: Can not be installed

with #3010 or #3035. Field Installation: Conversion to #3010 or #3035 requires an RPQ.

4700 B-Loop Attachment (#3010): This feature will allow the 4731 to be attached locally or remotely to a 4701 and a 4702 Branch Processor. For local B-Loop attachment, the customer will be instructed to provide the appropriate attachment cable (see "IBM 4731 Planning and Site Preparation Guide", GA19-5347). Included with this feature, is a 12m (40 ft.) cable which will support attachment of the 4731 to an external modem for remote B-Loop communication. The 4731 can also be attached remotely via the 5989-B01 to the 4701 and the 4702. If the 4731 is attached remotely to a 4701, or to a 4702 an IBM modem or the equivalent is required. Limitations: Cannot be installed with #3005 or #3035. Field Installation: Conversion to #3005 or #3035 requires an RPQ.

BSC 3 Communication (#3035): This Feature supports Binary Synchronous multi-point, polled line protocol at a line speed of 1,200, 2,400, 4,800 and 9,600 bps. The 4731 will recognize the BTAM BSC 3 implementation and the BTAM BSC3 3276 display device implementation with EBCDIC or USASCII transmission code. This attachment requires an IBM modem or equivalent (see "external modems" below). A 12m (40 ft.) cable assembly for attachment to an external modem will be provided with the BSC 3 communication adapter. Limitations: Cannot be installed with #3005 or #3010. Field Installation: Conversion to #3005 or #3010 requires an RPQ.

External Modems

Modem	Speed (bps)	Line
3603 mdl 2	2400/1200	Nonswitched
3833 mdl 1	2400	Nonswitched
3834 mdl 1	4800	Nonswitched
3863 mdl 1	2400/1200	Nonswitched
3864 mdl 1	4800/2400	Nonswitched
3865 mdl 1/2	9600/4800	Nonswitched
3868 mdl 1	2400/1200	Nonswitched
3868 mdl 2	4800/2400	Nonswitched
3868 mdl 3/4	9600/4800	Nonswitched
3872 mdl 1*	2400/1200	Nonswitched
3976 mdl 3**	1200/600	Nonswitched
5979-L41**	9600	Limited Distance
5989-B01		

* 3872 mdl 1 for Canada only

** 3976 and 5979 not for Canada

The 4731 can also be attached to the following IBM Modems:

Modem	Speed (bps)	Line
5865	4800/9600	Nonswitched
5866	9600	Nonswitched
5868	9600	Nonswitched
5811	2400/4800	Limited Distance Modem
	7200/9600	
5812	2400/4800	Limited Distance Modem
	7200/9600	

External Modem Interface: Provides a 12m (40 ft.) cable assembly and a V.24 interface for attachment to an external IBM modem or PTT mandatory modem complying with CCITT recommendation V.24, V.28 ISO Standard 2110 and other relevant CCITT recommendation. Attachment to non-IBM modems or other DCEs is subject to the provision of the Multiple Supplier System Bulletin.

The following special features can be ordered optionally:

- #3015 Additional Feed Modules
- #3020 Receipt/Statement Printer
- #3030 MM Security Box Attachment
- #3039 Extended Keyboard
- #3050 Digital Camera Interface
- #3055 Diskette Journal
- #3060 External Contacts
- #3243 Envelope Depository
- #3245 Sequence Printer

Additional Feed Modules (#3015): This feature provides an additional feed module for a Non-Locked or Electronically locked currency cartridge in the 4731. Maximum: Three additional Feed Modules can be ordered for a 4731 Model BH1 and Model BO1. Field Installation: Yes.

Receipt/Statement Printer (#3020): The transaction Receipt/Statement printer prints on variable size receipts and statements and preprinted fan fold single ply paper. The form size is 101.6mm (4 in.) or 105.8mm (4.16 in.) vertical and between 150mm and 216mm (6 to 8 in.) horizontal. The print speed is 200 character/second (cps). The horizontal spacing is 10 and 12 characters/inch (cpi) and line spacing is done with 6 or 8 lines/inch (lpi). Paper weight is 70 - 90 grams/sqm. Depending of the horizontal size of the document, the number of characters printed per line is 64 to 95. Highlighting of characters can be accomplished by means double-dotting (double printing). Such characters will have twice the width of a normal character. After completion of the document printing, an automatic cutting device cuts the document. The paper supply compartment can hold up to 5000 documents. Field Installation: Yes.

MM Security Box Attachment (#3030): For those countries using the MM box, an attachment capability is provided by this feature. The MM Security System cable and sensor will be installed, tested and adjusted at the IBM plant if ordered at machine order time. Installation of the MM Security Box is the customer's responsibility. Field Installation: Yes.

Extended Keyboard (#3039): Exclusively to the standard consumer keyboard (12+4 keys), an extended consumer keyboard (+16 function keys) can be ordered. The keyboard is extended to the left side with additional 16 function keys. Physical arrangement provides for four rows (each consists of 4 keys) divided into two blocks. Color of the keys are either: Blue, Red, Green, White or Yellow. Customers with 3624s and 4736s installed, have the opportunity to provide their users the same "User <-> Machine" interface on the 4731. Limitation: Plant installation only.

Digital Camera Interface (#3050): The 4731 Camera Interface Feature provides signals to a non-IBM camera to allow it to be triggered at specific points in the 4731 transaction sequence. ASCII Data will be supplied to the non-IBM camera to allow capture of time, date, transaction sequence number, 4731 machine identifier and a code defining the step in the transaction sequence at which the specific frame was captured. Additional alphanumeric data can optionally be supplied to the non-IBM camera by the host computer application program. The Camera Interface will receive the following status from the non-IBM camera, if provided, and pass them on to the host application:

- Low media (film, videotape)
- Out of media
- Camera unavailable

Field Installation: Yes.

Diskette Journal (#3055): The Diskette Journal Feature provides a second diskette drive in the 4731. All financial transactions attempted on the 4731 are written to the Diskette Journal. All transaction records and transaction responses are journaled. Journaling will take place for both successful and unsuccessful transactions. Diskette Journal capacity is at least 1,500 transactions. The diskette has a capacity of 1.2Mb. The contents of the diskette can be displayed or printed using an IBM PC AT (or compatible device). A sample PC AT program is provided to assist the user in writing an application program to satisfy user requirements. When the diskette is full, the user can optionally cause the 4731 either to close or to suspend use of the Diskette Journal Feature. Field Installation: Yes.

External Contacts (#3060): The External Contacts Feature provides six contacts which will allow the customer to attach and control non-IBM devices or Indicators. The function of the contacts are as follows:

- Open Contact: This contact closes when the 4731 is available to process user (Financial Institution customer) transactions.

- Closed Contact: This contact closes when the 4731 is not available to process user transactions.
- Safe Door Open Contact: This contact closes when the safe door is opened.
- Any Door Open Contact: This contact closes when any door of the upper compartment will be opened.
- Camera Contact: This contact closes at the beginning of a user transaction after Magn.Card read and it can be used to activate any recording equipment.
- Intervention Required Contact: This contact is a normal open/normal close contact and is activated under following conditions:
 - Printer paper low or out
 - Printer Jam
 - Document low or out
 - Document dispenser jammed
 - Credit Card Reader jammed
 - MM security device out of service

The External Contact Feature is compatible with the equivalent feature on 3624. The same cable may be used to connect to the 4731. Field Installation: Yes.

Depository (#3243): Provides Envelope transport mechanism leading from a transaction controlled gate to a controlled access slot in the security enclosure to deposit receptacle inside the 4731. In addition to the controlled gate at the consumer console and the controlled access slot in the security enclosure, the depository transport is designed to discourage tampering with previously inserted deposits. Deposit envelopes may vary in size from 89mm x 152mm (3.5 x 6 in.) to 114mm x 247mm (4.5 x 9.75 in.) and shall be constructed of paper having basis weight of sub 20 through sub 28. Maximum thickness of a deposit envelope and its contents is 12.7mm (0.5 in.). Capacity of the envelope container/bin is about 300 envelopes. However, number of envelopes depends on the average size and thickness of the envelopes. Prerequisite: Sequence Printer #3245. Limitation: Plant installation only.

Sequence Printer (#3245): Prints sequence number on envelope as it passes through the depository throughout. Six numeric digits are printed horizontally at repeated intervals along the envelope. Three digits are set by the customer to identify unit, and three digits are automatically sequenced when the envelope passes the print station. It is the customers responsibility to purchase and replace ink roll when required. Limitation: Plant installation only. Prerequisite: Depository feature #3243.

MODEL CONVERSIONS (NONE)

ACCESSORIES

The 4731 will be shipped with one currency reject cartridge, one lockable retained card bin, and one display privacy filter. Replacement accessories and spares may be ordered from IBM. No Currency Cartridges are shipped with the base machine and must be ordered as accessories. A cartridge loading frame accessory is required to open the electronically locked currency and rejected note cartridges. The following accessories can be ordered from IBM:

- *Currency Cartridge (electronically locked)
- *Currency Cartridges Non-locked
- *Rejected Note cartridge electronically Locked/Power
- *Rejected Note cartridge Non-Locked/Power
- (Canada only) > Rejected Note cartridge electronically locked/standard
- *Rejected Note cartridge Non-Locked/standard <)
- *Cartridge loading frame (opens electronically locked currency and rejected note cartridge) (P/N 56X1550)
- Unprinted silk screened Logo panel (P/N 74X1848)
- Pedestal 85mm (3.4 in.) height (P/N 74X1878); Maximum stack height is 255mm

MACHINE ELEMENTS (NONE)

SUPPLIES

- Depository ink roll (P/N 457149)
- Receipt/Statement Printer ink ribbon
- Card reader head cleaning cards

- Card reader test cards

The following starter set of supplies will also be shipped with each 4731 and additional quantities may be ordered from IBM:

- Depository ink roll (P/N 457149)
- Receipt/Statement Printer ink ribbon
- Card reader head cleaning cards
- Card reader test cards

4733 TELLER ASSIST UNIT

PURPOSE

A multi-denomination teller assist unit (TAU) designed for the teller cash handling application.

MODELS

Model 1 001: 4 denominations - no upgrade possibility

Model 2 002: 4 denominations - possibility to upgrade to 5 or 6 denominations

Prerequisites: Electronic or non-locking currency cartridges, an electronic or non-locking reject cartridge, and a loading module or loading stand have to be ordered separately (refer to "Accessories" section) well in advance to make sure all accessories arrive in time.

Note: Additional spare cartridges (currency, reject and deposit) have to be ordered as accessories from IBM Direct.

Customer Setup (CSU): No.

HIGHLIGHTS

The 4733 is a multi-denomination Teller Assist Unit (TAU) designed for teller cash handling applications. Installations will be in lobbies only and always attended. The 4733 is not intended for operation in outside weather conditions.

The 4733 includes support for at least four denominations, a 3mm enclosure, time lock, two deposit cartridges. The position of the cradle containing the notes indicates which one of the two tellers requested the cash.

Cash notes (old and new) will be dispensed in a bundle composed of one to six denominations of currency. The notes are individually fed from electronic currency cartridges, but are escrowed and presented to the teller in a single bundle.

The 4733 can attach to an IBM 470X Branch Processor via the banking loop (B-Loop) or to any other controller/PC/terminal via the EIA RS-232-C interface (CCITT V.24, Start/Stop).

Note: SDLC and RS-232-C are exclusive on the IBM PC.

Currency cartridges hold approximately 2,000 bills; reject cartridges hold about 300 note bills.

The 4733 is available only in countries listed in Accessories - Electronic/Non-Locking Currency Cartridges.

Additional countries/currencies will be supported after successful currency issue test. To request a currency issue test for a non-supported currency/denomination, submit an RPQ to FS Boeblingen Germany.

SPECIFY (NONE)

Note: The 3-digit Country Code on the DP Machine Order Sheet will be used to select a power plug which matches the most commonly used power supply in the country. The same code will be used to select the machine's nomenclature.

SPECIAL FEATURES

Non-Communications Features

Feed Module (#3010): Provides an additional Feed Module. Limitations: Available for 4733-002 only. Maximum: Two. Field Installation: Yes.

Communication Features

Banking Loop Adapter (#3005): Provides capability to attach to 4700 loop. Attachment to local loop is directly. Maximum: One. Field Installation: Yes. Prerequisites: Available position on the loop.

MODEL CONVERSIONS (NONE)

MAINTENANCE

Maintenance of the IBM 4733 is available under the IBM Maintenance Agreement.

IBM will not provide warranty or maintenance service on a 4733 containing money. The customer will be responsible for removing, controlling and reloading all money in the 4733 so that IBM can fulfill its warranty and maintenance obligations. One empty currency cartridge is required by the customer for problem determination and for the CE for servicing the 4733. The denomination of this empty cartridge should match the denomination of the test notes shipped with the 4733.

Customers with 4733s not covered by an IBM Maintenance Agreement may have the unit(s) repaired, if repairable, on-site for a time-and-material charge.

If maintenance coverage is not contracted for immediately following expiration of any warranty and the customer subsequently wants IBM Maintenance Agreement coverage, the customer must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined. This qualification will be done at the customer's site. If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs is billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Electronic/non-locking currency cartridges, electronic/non-locking reject cartridges, deposit cartridges and loading modules/stands are accessories; they may be repaired at an IBM designated Repair Center. Problem determination and shipping of the cartridges and loading modules is the customer's responsibility.

ACCESSORIES

The following items are available on a purchase-only basis through IBM Direct channels.

The deposit cartridges have mechanical locks and need mechanical keys to open. The electronic currency cartridges and the electronic reject cartridges are electronically locked and require a loading module to open for loading or removing of note bills.

The non-locking currency cartridge provides the optional capability to secure the contents by the use of seals, either wire or plastic. Once the cartridge has been properly sealed, the cartridge contents cannot be removed without first removing the seal. The seal must be removed before inserting the cartridge in the document feed mechanism of the 4733.

If the cartridge seal is not installed, the cartridge can be easily opened without using tools or the cartridge loading stand.

MACHINES

The non-locking currency reject cartridge provides the optional capability to secure the contents by the use of seals, either wire or plastic. Once the cartridge has been properly sealed, the cartridge contents cannot be removed without first removing the seal. The seal must be removed before inserting the cartridge in the currency feed mechanism of the 4733.

If the cartridge seal is not installed, the cartridge can be easily opened without using tools or the cartridge loading frame.

The loading stand assists in the proper loading of the currency cartridges (non-locking) by holding them at the correct angle. This angle allows the proper tension setting to be made, and it also provides clearance for the latch which projects from the rear of the cartridge when it is open. If the customer already has a cartridge loading module accessory for servicing electronically-locked cartridges, it may also be used to service the new non-locking cartridges.

SUPPLIES (NONE)

4736 PERSONAL BANKING MACHINE

PURPOSE

A cash issue machine designed for bank lobby and vestibule applications, as well as for indoor, off-bank premises applications (e.g., convenience stores, supermarkets, railway stations, etc.).

MODELS

Model RH2: 2 document feed modules, an IBM-provided hardened enclosure (UL-291 level safe which complies with the intent of U.S. Federal Regulation P for unattended operation), and serviced/maintained from the rear.

Model RS2: 2 document feed modules, an IBM-provided soft enclosure (UL-291 level enclosure which complies with the intent of U.S. Federal Regulation P for attended operation), and serviced/maintained from the rear.

(Except Canada > **Model R02:** 2 document feed modules, sub-assemblies which will be shipped for attachment in a non-IBM provided safe. The machine is serviced/maintained from the rear. <)

Prerequisites: Remote attachment to a host or subhost. This attachment requires the use of modems which are capable of supplying data clocking, or their equivalent, which are capable of supplying data clocking.

For SDLC communications supported transmission rates are 1200, 2400, 4800, and 9600 bps. For remote attachment to the 4701 Controller, the EIA/CCITT interface (#3701), and the SDLC Communications Adapter Without Business Machine Clocking (#4502) are required on the 4701. The A.L.A. port (#3702) and SDLC Communications Adapter Without Business Machine Clocking (#9645) are required on the 4702.

For BSC III communications support transmission rates are 1200, 2400 and 4800 bps.

Local attachment to a 4701 Controller requires the Fanout Communications Adapter (#1551), and the SDLC Communications Adapter Without Business Machine Clocking. Local attachment to a 4702 Branch Processor requires the A.L.A. port (#3702) and #9646. Supported transmission rates are 2400 bps (122m, 400 ft, maximum cable length), 4800 bps (61m, 200 ft, maximum cable length), and 9600 bps (30m, 100 ft, maximum cable length).

BLOOP attachment to a 4701 or 4702 Controller. The 4736 may be attached locally to the controller or it may be remotely attached. If the 4736 is attached remotely, modems such as the 3603, 3863, 3864, 3865, or the equivalent, are required.

Customer Setup (CSU): Yes.

HIGHLIGHTS

The 4736 provides a wide range of self-service banking services including cash withdrawal, account balance inquiry, and funds transfer between accounts. In addition, other applications may be implemented by the bank customer.

In the design of the 4736, particular attention has been paid to physical size, appearance, human factors, and privacy. Focus has been given to accommodating various types of physical, customized installations, in bank lobbies and vestibules, and certain non-bank locations such as airports, railway stations, department stores, etc. 4736 functions include:

- Guidance from display (480-character CRT)
- Selection keys using the display for prompting (keys are adjacent to sides of display)
- Keyboard input (numeric and function keys)

- Audio and tactile feedback for keyboard entries
- Track 1 card read (IATA standards)
- Track 2 card read (ABA and ISO standards)
- Track 3 card read/encode (ABA and ISO standards)
- JUCC read (Japanese Universal Credit Card Reader)
- PIN validation directly within the 4736 (customer option)
- Cash issuing (up to 2-denominations)
- Account balance inquiry
- Funds transfers between accounts
- Fixed amount, single-key cash selection from a menu of permissible amounts (fast cash)
- Customized bank transactions
- Institution message identifier
- Financial institution tables (for multi-bank ATM network)
- Transaction chaining
- Encryption/decryption
- 'Cash low' and 'cash out' (cartridge) messages to host
- Printer forms 'low' and 'out' messages to host
- Host interactive response key entry
- Card retract for transaction chaining and customer forgotten cards
- Card capture (retain)
- Ability to change denomination mix (user option and dynamic reconfiguration by 4736)
- Communication Network Management (CNM support)
- Transaction receipt printing
- SNA/SDLC (to host)
- BSC III (to host)
- 4700 BLOOP attachment
- SNA/SDLC attachment 4701 FCS controller (SNA Primary attachment) and 4702 FCS Processor (ALA port)
- Card eject on power failure (returns magnetic stripe card to the user)
- Customization of function keys (masks and overlays)
- Dynamic reconfiguring directly in 4736 upon component failure (customer algorithms)
- IBM safe enclosure on mdl RH2 (UL-291 listed for unattended environments)
- Dual custody IBM safe enclosure
- Alarm grids for IBM safe enclosure on mdl RH2
- Provision to install a thick safe enclosure supplied by OEM safe vendor (mdl R02)
- Large character matrix on display
- Use of preprinted receipt forms for transaction receipts
- Locally stored image and microcode eliminate need to download after power loss or machine reset
- Installation flexibility: free standing, in teller counter, or in interior wall
- Customer setup
- Support for major worldwide currency notes
- Support for major worldwide languages on display and printer
- Statement of Direction
- IBM intends to provide a 3624 emulator for the 4736.

DESCRIPTION

The 4736 Personal Banking Machine is a self-service cash dispenser which automates a wide range of financial services and teller activities, including cash withdrawal, account balance inquiry, and funds transfers between accounts, as well as other applications which can be implemented by the bank customer. The physically small, 1- or 2-denomination machine may be easily installed in an open area, built into an interior wall, or be installed in a teller counter.

(Canada only > The 4736 is available in two models. <)

(Except Canada > The 4736 is available in three models. <)

Standard Features:

- Document Feed Module: Each base model contains two document feed modules. The number and mix of notes dispensed

to satisfy a cash withdrawal is under program control. When one currency cartridge is empty or unavailable, the 4736 will automatically reconfigure and feed documents from the remaining currency cartridge to satisfy the withdrawal so long as the remaining cartridge contains the correct note denomination to satisfy the withdrawal request.

Notes will be delivered to the user in a single bundle, containing up to twenty notes.

Currency cartridges are ordered (Except LAD> as accessories <) (LAD only> as CSU Special Features <) and are either electronically locked/unlocked or non-locking and sealable with lead wire or plastic seals. The currency cartridges have a handle for easy carrying. The 4736 will sense low note and empty cartridge conditions and report it to the controlling device.

Reject cartridges are ordered (Except LAD> as accessories <) (LAD only> as CSU Special Features <) The reject cartridges are portable and are either electronically locked or non-locking and sealable exactly like the currency cartridges. A reject cartridge can hold up to approximately 300 notes.

A cartridge loading frame or cartridge loading stand is ordered as an accessory. A cartridge loading frame opens the electronically locked currency and rejected note cartridges. Either a cartridge loading frame or cartridge loading stand positions the non-locking cartridge for proper loading of notes.

- Display: The 4736 display is a 9-inch diagonal monochrome display which has a 480-character capacity (12 lines of 40 characters each).

A limited-angle privacy viewing filter will be provided as a standard feature. Replacement filters can be ordered as accessories. The filter prohibits viewing the display from a side angle, and enhances the user's privacy. The viewing angle is limited to 24 degrees on either side of the center of the screen.

Languages supported by the display include English, western European languages, Chinese, Hangeul, Thai, Hebrew, and Arabic. Large character fonts are used in support of Chinese, Hangeul languages. Support for large character fonts on the 4736 display is provided as standard in the following countries: Korea, Hong Kong, Indonesia, Malaysia, Singapore and Taiwan.

- Identification Card Reader/Encoder: The identification card reader/ encoder on the 4736 will provide for track 1 read, track 2 read, and track 3 read/write. Track 1 will adhere to IATA standards; tracks 2 and 3 will adhere to ABA and ISO standards. The card reader also supports the JUCC (Japanese) magnetic stripe standard.

The card reader ejects a credit card (return to user) upon power failure, and will have a secure, removable card cartridge for holding identification cards which are captured during normal operations.

Customers have the option of having the card inserted either magnetic stripe up or magnetic stripe down (one only). All machines will be shipped with "stripe up" orientation. Conversion from one orientation to the other may be done very easily by the customer in the field.

The card reading mechanism has a lockout device which is ordinarily closed, preventing foreign objects from being inserted into the card reader. The reader recognizes the presence of the magnetic stripe when a card is inserted, and therefore opens the lockout gate. The card, if it is the correct size, is then automatically fed into the reader, and the lockout gate closes for the duration of the transaction.

Under program control, the card reader can retain (capture) a card (not return it to the user). Captured cards are inserted into a locked, removable cartridge as described previously.

Under program control, customers may elect to retain cards forgotten (left in the reader) by the users.

- Transaction Receipt Printer: The Transaction Receipt Printer prints variable length receipts from roll paper. The paper is cut following the printing of the receipt.

The speed of printing is at least 100 cps, and up to 48 characters per line will be printed.

The paper supply is roll paper and the capacity of the roll will be at most, 2,500 3-inch receipts (depends upon paper thickness) 4.5 inches wide. The paper will be furnished as an IBM supply.

Highlighting of characters can be accomplished by means of 'double-dotting'. Such characters will have twice the width of normal characters. The receipt printer has the capability to print in customer selected positions on pre-printed roll paper receipt forms. The ribbon for the receipt printer is made available as an IBM supply, and will be cartridge loading. The ribbon is available in two colors, black and purple.

- Keyboards: 4736 keyboards consist of a combination of an IBM 3624-type function/numeric keyboard and a set of display selection keys, which use the display for prompting. Both sets of keys are provided as standard on the 4736.

The function/numeric keyboard is similar in layout to that of the IBM 3624 CTF, and is in a horizontal position (parallel to the floor) for privacy reasons. It contains a 12-key numeric section. Alphabetic characters can be listed above the numeric characters on the numeric keyboard keytops. In addition to the 10 numeric keys, this section of the keyboard will contain a "decimal point" key and a "date correction" key.

To the right of the numeric key section, will be three keys labeled: "Cancel", "Change" and "O.K."

To the left of the 12-key numeric section, will be up to 16 function keys consisting of up to eight transaction definition keys and up to eight "From/To" keys.

The country code will determine the specific keyboard mask and overlay that is shipped with the machine. Customized overlays and masks will be provided as IBM accessories according to customer specifications.

The display will provide prompting messages for each of the eight display selection keys (four on each side of the display), and the customer can optionally use the display selection keys for making selections in lieu of or in addition to using the function/numeric keyboard.

The contour of the sides of the user console area provides for additional privacy when using the keyboard.

- The RH2 (Except Canada> and R02<) (hardened enclosure versions) have gates at the console level to protect the cash issue and receipt issue areas against the insertion of foreign objects. The design of the 4736 also protects against adverse effects from the spilling of small amounts of liquid on the user console area.

The 4736 mdl RH2 contains a penetration alarm grid with contact pins for interfacing with a security alarm system. The alarm grid protects five sides of the Document Feed Mechanism enclosure. The bottom of the enclosure is not protected by the alarm grid.

The 4736 uses the DES (National Bureau Of Standards) algorithm for encryption and decryption of sensitive information entering and leaving the 4736 on the communications facility.

The 4736 contains a diskette for the storage of systems microcode and images which characterize the operation of the unit.

The 4736 may be serviced from the rear only. An accessory turntable is available to allow the 4736 to be rotated 180 degrees for servicing from the front (mdls RH2 and RS2 only).

MACHINES

The 4736 continuously monitors its devices to detect abnormal or exception conditions and reports such events to the host via the event message.

If an error is detected during an operation, certain operations are retried a predetermined number of times. If unsuccessful, the function is terminated and the consumer is notified. Recovery may require reconfiguration or service action. All detected errors are logged for use by the institution in service history reporting. Under program control the customer can instruct the 4736 to continue operations even when certain features are not operating.

A provision to accept magnetic striped cards of many different card issuers is supported.

The 4736 can display different languages based on the identifier code recorded on the customer's magnetic stripe card, or based upon consumer selections made via the display. A maximum of four languages can be selected by the customer for any 4736.

Customer Responsibilities: The customer is responsible for:

1. Assuring that use of the equipment complies with all Country and local laws, regulations, ordinances, etc.
2. Adequate site, system, and other vendor preparation.
3. Price quotations, installation, and cost (initial and recurring) of common carrier equipment and service.
4. Receipt at customer's receiving dock, unpacking, and placing of the 4736.
5. Physical setup, connection of cables in protected customer-access areas.
6. Make available a currency cartridge and a cartridge loading frame for installation and maintenance.
7. Performing 4736 checkout in accordance with supplied procedures for initial installation or relocation.
8. Creating the customization image and loading it onto the operational diskette.
9. Checking communications with the 4736 Controller or with the host processor.
10. Developing and/or obtaining and installing application programs to communicate with the 4736.
11. Using the problem determination procedures provided with the 4736 to determine the failing component and filling out the appropriate 4736 Trouble Report prior to requesting on-site maintenance service.
12. Notifying IBM of machine relocation for field service coverage.
13. Procuring maintenance service for locks and procurement of any spare or replacement locks.
14. Providing maintenance service for door, hinges and locking mechanisms for hardened enclosure (mdl RH2).
15. Procuring and replacing replacement ink ribbons and paper rolls for the transaction receipt printer. Ink ribbons and paper rolls are available from IBM.
16. Procuring preprinted receipt forms for preprinted receipt forms printer.
17. Procuring any spare or replacement CSU special features or accessories.
18. (LAD only) Procuring non-IBM safe for mdl R02 and making provisions to have mdl R02 installed in non-IBM safe. (<)
19. Procurement and installation/attachment of all non-IBM devices controlled by the External Contact Feature.

20. Procurement and installation/attachment of non-IBM camera and associated equipment controlled by the Camera Interface Feature.
21. Provide application programs to process Diskette Journal data on an IBM PC/AT (or compatible device).
22. Provide wire or plastic seals for use with the new Currency and Rejected Note Cartridges.

Publications:

- GC31-0046 IBM 4736 Personal Banking Machine General Information Manual
- GC31-0060 IBM 4736 Personal Banking Machine Planning and Site Preparation Guide
- GX31-4507 IBM 4736 Personal Banking Machine Physical Planning Template

Recommendations For Efficient Operation:

- Keep Spare Currency Cartridges: Currency cartridges for use in the 4736 and spare or replacement currency cartridges may be ordered from IBM. Spare cartridges permit the customer to have cartridges replenished without having to interrupt service for extended periods of time. The service document cartridge and a cartridge loading frame must be made available to the field service personnel whenever a service call is made.
- Use New or Used Currency in Good Condition: The general condition of used currency may vary. Used currency must be inspected to remove excessively worn, damaged, or torn notes. The "IBM 4736 Personal Banking Machine Operator's Guide", GC31-0051, contains procedures for preparation of new currency and inspection of used currency for operation in the 4736.

Maintenance: Maintenance of the 4736 is available under the IBM Maintenance Agreement.

IBM will not provide warranty or maintenance service on a 4736 containing money. The customer will be responsible for removing, controlling, and reloading all money in the 4736 so that IBM can fulfill its warranty and maintenance obligations.

Customers with 4736s not covered by IBM Maintenance Agreements may have the unit(s) repaired, if reparable, on-site for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any warranty, and the customer subsequently wants IBM Maintenance Agreement coverage, the customer must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined. This qualification will be done at the customer's site.

If a unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs is billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement Coverage.

IBM does not maintain locks (either key or combination locks), or the door, hinges or locking mechanism of the hardened enclosure (mdl RH2).

Customization: The enclosure of the 4736, as shipped, will be finished in pearl white. The optional front panel accessory, below the user console, may be removed for custom painting by the customer. Also, the customer may use a custom panel in place of that supplied as an IBM accessory.

Specify Options:

- Machine Designation: Primary and secondary machine designation is required to control distribution of the 4736 microcode updates. Specify #9491 or #9492 as follows:
 - Primary Machine (#9491). Indicates microcode updates are to be shipped to the machine location.

- Secondary Machine (#9492). Indicates no microcode updates are to be shipped for this machine.

- At order time for the 4736, one of the following must be specified:

Document Reject Cartridge Electronic-Locking #9000
Document Reject Cartridge Non-Locking #9001

- Power configuration will be determined by country code.
- A standard keyboard overlay and mask will be provided as determined by the country code. Additional standard mask and overlays may be ordered (Except LAD>as accessories.<) (LAD only>as CSU Special Features.<) Custom masks and overlays may be obtained via RPQ. IBM 3624 CTF and IBM 4730 Personal Banking Machine keyboard overlays

and masks can be used with the 4736 provided their function is consistent with that of the 4736.

Capacities:

- Transaction receipt printer: Approximately 2,500 3-inch long receipts of 16-pound paper.
- Currency cartridge: 2,050 new U.S. notes, or equivalent.
- Currency rejected note cartridge: 300 U.S. notes, or equivalent.
- Identification card capture cartridge: 30 cards.

Currencies/Denominations: IBM intends to support major world-wide currencies on the 4736. To-date, the following currencies have been tested and are supported:

Country	Denominations	Quality of Note Supported	Mint Used	Comments Restrictions
Argentina	1, 10 Austral	Yes	-	
Australia	5, 10, 20 Dollar	Yes	Yes	Facing Restriction for Mint Notes.
Canada	5, 10, 20 Dollar	Yes	Yes	
Chile	500, 1,000 Peso	Yes	Yes	
Colombia	500, 1,000 Peso	Yes	Yes	
Costa Rica	500 Colones	Yes	Yes	
Ecuador	100, 1,000 Sucres	Yes	Yes	
Guatemala	5, 10 Quetzales	Yes	Yes	
Hong Kong	10, 100 Dollar (SCB)	Yes	Yes	1985 Issue, Only.
Hong Kong	100 Dollar (HKSH)	Yes	Yes	1985 Issue, Only.
Indonesia	1,000, 10,000 Rupiah	Yes	Yes	
Korea	1,000, 10,000 Won	Yes	Yes	
Malaysia	10, 50 Dollar	-	Yes	
Mexico	1,000, 5,000 Peso	Yes	Yes	
New Zealand	5, 10, 20 Dollar	Yes	Yes	
Peru	50,000 Soles	-	Yes	
Peru	100 Intis	Yes	Yes	
Singapore	10, 50 Dollar	Yes	Yes	
Thailand	100, 500 Baht	-	Yes	
Uruguay	1,000 New Peso	Yes	Yes	
Venezuela	50, 100 Bolivar	Yes	Yes	

IBM will periodically announce support for additional currencies supported.

Banking Machine Remote Network Monitor program (see below) will transmit the image from 4701 or 4702 to the 4736.

PROGRAMMING SUPPORT

The 4736 will be supported by the following program products:

- IBM 4730 Customization Image Builder (5668-870) Release 2: This program will operate in a S/370, 30XX and 43XX Processor to allow customers to create and/or modify a customization image for the 4736. The 4736 image defines such options as currency denominations to be dispensed, wording and formatting of display screens and printed user receipts, and all other characteristics required to operate the 4736.

The program will be distributed on magnetic tape along with a sample 4736 image.

The customer will use available full-screen host editor programs to create/modify 4736 images for his own use.

The IBM 4700 Finance Communication System Host Support Program (5688-989) Release 5 Modification Level 1 or later will contain facilities to store and manage the customized image file and transmit it to the 4736. If an intermediate IBM 4700 Finance Communication System is used, the IBM 4730 Personal

- IBM 4730 Personal Banking Machine Network Monitor (5668-871) Release 2: This program will operate on S/370 processors, the 30XX and 43XX processors, and provides monitoring and control functions for a network of 4736 machines. The program maintains a record of the status of each 4736, and provides control of 4736 operations. It operates interactively as either a CICS or IMS application program using online data files for the 4736 status data collection.

Some of the tasks associated with monitoring and controlling the 4736 network are:

- Initialization and startup procedures to open the 4736 for business.
- Recovery action to re-open a 4736 after certain closures, such as for servicing or as a result of communication failure.
- Logging events such as status changes of the 4736 and its components, and alerting the network operator of situations which require attention. Examples include device failure on the 4736, "low" note or "out of" note levels for currency cartridges, and supplies that need replenishing.
- Periodic changes of communication encryption keys.
- The program supports the use of color displays and online printers for network monitoring and control.

- IBM 4730 Personal Banking Machine Availability Management-Batch Reporting Program (5668-873) Release 2: This program runs in a batch mode on VSE or OS/VS systems. It creates reports by processing 4736 events and command response collected by the IBM 4730 Personal Banking Machine Network Monitor or a similar application program. Availability Management-Batch Reporting produces two types of reports: Network reports which list the 4736s in the network along with statistical information enabling the customer to compare the performance of one 4736 with the performance of others; workstation reports which provide detailed information about a specific 4736.

The network reports provide an overview of the network performance; the workstation reports provide details used for problem resolution. Release 2.0 of the IBM 4730 Personal Banking Machine Availability Management-Batch Reporting, adds support for the 4736 Personal Banking Machine and its associated features. New report functions support multiple 4736 operational time frames, (including holidays); provide additional operational availability data; sequencing by machine type, controller and institution; and offer enhanced facilities for controller attached 4736s.

Supports definition of multiple 4736 operational time frames (including holidays). Enhances Availability Report Information. Enhances support for controller attached 4736s. Provides additional report options, loads all error log, event, command responses and statistical counter descriptions from a table thereby allowing for addition and deletion of message descriptions. Enhances Availability Report information.

- IBM 4730 Personal Banking Machine Remote Network Monitor (5668-872) Release 1: This program, which runs in a 4701 Controller or a 4702 Branch Processor, provides the 4736 device control support and assists the customer in monitoring and controlling a small network of 4736 machines attached to the controller or branch processor. The 4736 machines would be attached either via the BLOOP or SNA primary (SNAP) attachment feature. PBMRNM is an RM4700 based program and provides 4736 device support/control.

Any additional institution financial application/transaction code will be supplied by the 4736 customer.

SPECIAL FEATURES

Specify one of the following on each order:

- SNA/SDLC Communication #3005
- 4700 Bloop Attachment #3010
- BSC III Communications #3035

SNA/SDLC Communications (#3005): With this feature, SNA/SDLC attachment is provided as follows.

A 12m (40 ft) cable assembly will be provided for remote attachment of the 4736 to a 4701 Controller, or to a 4321/4331 Communications Adapter, or to an IBM System/370, 303X, 308X or 309X via an IBM Communications Adapter (e.g., 3704, 3705, 3725, 3726).

Note: For remote attachment to the 4701 Controller, the EIA/CCITT Interface (#3701), and the SDLC Communications Adapter Without Business Machine Clocking (#4502), are required on the 4701. For remote attachment to the 4702 Processor, the Alternate Line Attachment Port (#3702) and the SDLC RS-232-C Interface (#9645) is required on the 4702. Supported transmission rates for remote SNA/SDLC communications are 1200, 2400, 4800, and 9600 bps. This attachment requires an IBM modem or equivalent. (See table below.)

This feature also supports local SNA/SDLC attachment to a 4701 Controller or a 4702 Processor. The Fanout Communications Adapter (#1551) and the SDLC Communications Adapter Without Business Machine Clocking (#4502) be installed on the 4701. The Alternate Line Attachment Port (#3702) and the Communications Interface (#9646) must be installed on the 4702. Supported trans-

mission rates are 2400 bps (122m, 400 ft, maximum cable length), 4800 bps (61m, 200 ft, maximum cable length), and 9600 bps (30m, 100 ft, maximum cable length).

This feature is field installable.

4700 BLOOP Attachment (#3010): This feature will allow the 4736 to be attached locally or remotely to a 4701 Controller or to a 4702 Branch Processor. For local BLOOP attachment, the customer will be instructed to provide the appropriate attachment cable (see "IBM 4736 Planning and Site Preparation Guide", GC31-0060). Included with this feature, is a 12m (40 ft) cable which will support attachment of the 4736 to an external modem for remote BLOOP communication.

If the 4736 is attached remotely to a 4701 Controller or a 4702 Branch Processor, an IBM modem or the equivalent is required. (See table below.)

This feature is field installable.

BSC III Communications (#3035): This feature supports Binary Synchronous multi-point, polled, line protocol at line speeds of 1200, 2400, and 4800 bps rates. The 4736 will recognize the BTAM BSC3 implementation and the BTAM BSC3 3276 display device implementation with EBCDIC or USASCII transmission code. This attachment requires an IBM modem or equivalent. (See table below.) This feature is field installable.

Modems	Speed (bps)	Lines
3603-1	1200	Nonswitched
3603-2	2400/1200	
3833-1	2400	Nonsw voice grade
3834-1	4800	Nonsw voice grade
3863-1,2	2400/1200	Nonsw or Sw voice grade
3864-1,2	4800/2400	Nonsw or Sw voice grade
3865-1,2	9600/4800	Nonsw voice grade
3868-1	2400/1200	Nonsw voice grade
3868-2	4800/2400	Nonsw voice grade
3868-3,4	9600/4800	Nonsw voice grade
3872-1	2400/1200	Nonsw or Sw voice grade
3872-1(1)	2400/1200	Nonsw or Sw voice grade
3976-3	1200/600	Nonsw or Sw voice grade
5811-10	2400 to 9600	Limited distance modem
5811-18		Rack mount version of 5811-10
5811-20	2400 to 9600	Nonsw baseband
5811-28		Rack mount version of 5811-20
5812-10	2400 to 9600	Nonsw baseband
5812-18		Rack mount version of 5812-10
5865-2,3	9600/7200/4800	Nonsw voice grade
5868-52		Rack mount version of 5865-1, 2

(1) Canada only

Note: 4-wire Switched Network Back-up is available on 3863, 3864, 3865, 5865 and 5866 modems with feature #7953 installed. 2-wire Switched Network Back-up is available on 5865 and 5866 modems with feature #7952 installed. See your TCM branch / TP coordinator for country limitations.

External Contacts (#3060): This feature will provide seven external contacts which will allow the customer to attach and control non-IBM devices. The functions of the contacts are as follows:

- "Open" Contact: This contact closes when the 4736 is available to process user (financial institution customer) transactions.
- "Closed" Contact: This contact closes when the 4736 is not available to process user transactions.
- "Intervention Required" Contact: This contact closes whenever the 4736 requires a financial institution operator to open the back door of the 4736.
- "Card Entry" Contacts #1, #2, and #3: These three contacts are controlled in parallel and are closed when a magnetic striped card is accepted in the 4736. These contacts will remain closed until the card is removed from the 4736 and the transaction completed.
- "Door Open" Contact: This contact closes when the door to the lower enclosure is open.

This feature is field installable.

CUSTOMER SETUP (CSU) SPECIAL FEATURES

CSU Special Features may be ordered via MES for installation on installed machines.

IBM 3624 Emulator (#3045): The 3624 Emulator Feature will support both IBM 3624 version 7 and 3624 version 8 protocols and functions. The existing IBM S/370 or 4700 applications for the IBM 3624 will run with minimal changes. The 4700 CPGEN will have to be modified to define the 4736. Attachment of an 4736 to the 3600 is not supported.

All IBM 3624 functions will be supported with the following exceptions:

- Host Interactive mode.
- JUCG.
- CHANGE DISPLAY MESSAGE command and CHANGE PAGE/SEGMENT command (these commands will be accepted by the 4736, but no data will be changed).
- Functions which require capability not available on the IBM 4736 (e.g., deposit acceptance).
- MM data will not be passed to the host.
- 3624 journal commands will cause the 3624 Emulator to write journal records to the 4736 system diskette. These diskette records can be read by a PC-AT.

Error Log Data, created by a failure which causes a 4736 closure or dynamic reconfiguration, is available to the host application programs.

Only the following IBM 3624 communications methods are supported:

- SNA/SDLC using an LU-0 interface (9600 bps maximum)
- B-LOOP attachment to the IBM 4701/4702

Teller/CE Services:

- Existing 4736 teller servicing operations, as well as CE diagnostics and operations are supported as in 4736 native mode. The CE diagnostics will reside on a separate diskette.

Additional IBM 4736 Unique Functions Supported:

- 480-character display and associated keys
- IBM 4736 receipt printer
- Track 1
- IBM 4736 language support
- Large character support
- ID card return at power outage
- Cash retract and "close" option
- IBM 4736 external contacts

Currency Support:

- Currency previously announced for the 4736 is supported.

IBM 3624 RPQs Supported:

- IBM 3624 keyboard overlay/keyboard mask (unless the RPQ requires a 3624 function that is not available on the 4736 (e.g., functions requiring a depository).
- Currency RPQs - Unless the currency is already supported on the 4736, 3624 currency RPQs must be submitted for approval on the 4736.
- RPQs providing 3624 function beyond that provided in the base version 7 and version 8 3624s are not supported.

Image Creation:

- The 3624 Emulator program requires a unique 4736 image (a sample object image will be provided with the 3624 Emulator Feature). The image can be created/modified by the Customization Image Builder or an equivalent product.
- For direct attached 4736s, the 4700 Finance Communication System Host Support (licensed program 5668-989) or the equivalent can be used to download the image to the 4736.
- For controller attached 4736s, the image can be delivered to the 4736 by:
 1. Transmission to PC/AT diskette (or equivalent) and manual loading of a diskette into each 4736.
 2. Transmission to customer-written 4700 user program by 4700 Host Support (or equivalent). The 4700 user program must then transmit the image to the 4736.

Camera Interface (#3050): The 4736 Camera Interface CSU Special Feature will provide to a non-IBM camera, signals to allow the non-IBM camera to be triggered at specific points in the 4736 transaction sequence. ASCII Data will be supplied to the non-IBM camera to allow capture of time, date, transaction sequence number, IBM 4736 machine identifier and a code defining the step in the transaction sequence at which the specific frame was captured. Additional alphanumeric data can optionally be supplied to the non-IBM camera by the host computer application program.

The Camera Interface will receive the following status from the non-IBM camera, if provided, and pass them on to the host application:

- Low media (film, videotape)
- Out of media
- Camera unavailable

Diskette Journal (#3055): The Diskette Journal CSU Special Feature provides a second diskette drive in the 4736. All financial transactions attempted on the 4736 are written to the Diskette Journal. All transaction records and transaction responses are journaled. Journaling will take place for both successful and unsuccessful transactions.

Diskette Journal capacity is at least 1,500 transactions. Each diskette has a capacity of 1.2 Megabytes.

The contents of the diskette can be displayed or printed using an IBM PC/AT (or compatible device). A sample PC/AT program is provided to assist the user in writing an application program to satisfy user requirements.

When the diskette is full, the user can optionally cause the 4736 either to close or to suspend use of the Diskette Journal Feature.

(LAD only) The 4736 will be shipped with one currency rejected note cartridge, one identification card retain cartridge, one standard keyboard overlay, and one standard keyboard mask. Replacement CSU Special Features and spares may be ordered from IBM. No currency cartridges are shipped with base models and must be ordered separately as CSU Special Features. A cartridge loading frame accessory is required to open the electronically locked currency and rejected note cartridges. Either the cartridge loading frame accessory or the cartridge loading stand accessory may be used to properly load the non-locking currency cartridges.

ACCESSORIES

(Except LAD> The 4736 will be shipped with one currency rejected note cartridge, one identification card retain cartridge, one display privacy filter, one standard keyboard overlay, and one standard keyboard mask. Replacement accessories and spares may be ordered from IBM. No currency cartridges are shipped with base models and must be ordered as accessories. A cartridge loading frame accessory is required to open the electronically locked currency and rejected note cartridges. Either the cartridge loading frame accessory or the cartridge loading stand accessory may be used to properly load the non-locking currency cartridge.

The following accessories can be ordered from IBM:

- Document cartridge loading stand - P/N 56X1550
- Turntable for front service - P/N 6937554

SUPPLIES

The following starter set of supplies will also be shipped with each 4736, and additional quantities may be ordered from IBM: Receipt Printer ink ribbon and Receipt Printer paper (if Receipt Printer special feature is ordered), card reader head cleaning cards, and card reader test cards.

The following supplies can be ordered from IBM:

- Purple Printer Ribbon - P/N 7033537
- Black Printer Ribbon - P/N 7037985
- Printer Paper Roll (12 Rolls per Box) - P/N 6064298

4860 PCjr**PURPOSE**

The 4860 PCjr is a small, low-cost system which is compatible with other members of the IBM Personal Computer family. PCjr is designed for use in home and educational environments and for personal productivity applications.

MODELS

Model 004: System Unit/Keyboard, 64KB Memory, two cartridge slots, transformer.

Model 067: System Unit/Keyboard, 128KB Memory (including 64KB memory and display expansion), two cartridge slots, transformer, one 360KB Diskette Drive.

Prerequisites: One of the following display options is required: A) an Adapter Cable for IBM Color Display (#0021) and a 5153 mdl 001 Color Display or equivalent, or B) a Connector for TV (#0020) and a user-supplied color television set, or C) a user-supplied color video monitor and cable. Four user-supplied AA-size batteries are required to operate the cordless keyboard. The optional Keyboard Cord (#0012) is required to operate the keyboard without batteries. The use of the 360KB Diskette Drive requires IBM Personal Computer Disk Operating System (DOS) Version 2.1 (6024120) or higher.

Customer Setup (CSU): All mdls and special features of the 4860 PCjr are customer setup.

HIGHLIGHTS

- The 4860 PCjr base system consists of three separate units: The system unit, a cordless keyboard, and a small power transformer. The optional keyboard cord and the transformer plug into rear-mounted jacks on the system unit. The system unit includes 64KB of Read-Only Memory (ROM), which contains the power-on self-test, Cassette BASIC interpreter, and cassette operating system.
- The Cassette BASIC interpreter provides the necessary cassette input/output instructions and a high level of support for display, keyboard, printer, light-pen, and joy sticks, as well as a full complement of editing, logic, math, and string functions. It is operational as soon as the system is turned on.
- The cordless keyboard, with a technology that is unique to the PCjr, is a low-profile, 62-key, detached keyboard that allows low cost and high quality. The keys are arranged in standard typewriter layout with the addition of a function key and cursor control keys. The keytops themselves are not labeled. The standard keyboard layout is permanently affixed above each key. This allows customization of the entire keyboard. There are two tilt positions for operator comfort: The normal position has 5-degree slope; with legs extended it has a 12-degree slope.
- The cordless keyboard is battery-powered and interfaces with the system unit by an infrared (IR) optical link. Mounted in the keyboard are two infrared emitting diodes that transmit coded information to the system unit. The receiver card, located in the system unit, has an infrared sensing device that receives the signal transmitted from the keyboard. The keyboard is powered by four customer-supplied AA-size batteries during cordless operation. It will function in cordless mode when located within 20 feet of, and in front of, the PCjr.
- An optional keyboard cord connection to the system unit is available power the keyboard and to send data to the system unit. The cord option must be used when multiple systems are being operated in the same immediate area to eliminate cross communication.

- The following items are supplied as standard with the 4860 PCjr system unit:

- 62-key cordless keyboard battery-powered infrared optical link operation within 20 feet of and in front of system unit
- 64KB of read-only memory (ROM) 250ns access time; 375ns cycle time; Cassette BASIC interpreter; Power-on self-test; Cassette operating system
- 64KB (mdl 004) random access memory, 128KB (mdl 067) random access memory (16KB reserved for video buffer)
- 360KB Diskette Drive (mdl 067 only)
- Intel 8088 microprocessor 4.77 MHz clock (210ns clock-cycle time)
- Two cartridge slots
- 60-volt-ampere step-down power transformer Separately housed; Weight: 2 lb 13 oz.; Power cord: 6 feet from power source to transformer; 4 feet from transformer to system unit
- 33-watt, 3-voltage-level, 2-stage power supply
- Audible alarm
- Sound subsystem that uses the speaker(s) in TV or display
- I/O connectors, keyed to prevent improper installation, for the following devices and options:

- ▲ Serial Devices
- ▲ Cassette recorder for loading or saving programs or data
- ▲ Joy sticks
- ▲ Modem
- ▲ Diskette
- ▲ Video/graphics subsystem
- ▲ Direct-drive video, composite video, and television
- ▲ Light-pen
- ▲ I/O expansion bus
- ▲ External audio

- Options for the 4860 PCjr that attach to the I/O connectors are:

- 360KB diskette drive for mdl 004 (standard on mdl 067)
- 64KB memory and display expansion for mdl 4 (standard on mdl 067)
- Internal modem
- Parallel printer attachment
- Keyboard cord
- Adapter cable for IBM Color Display
- Adapter cable for cassette
- Adapter cable for serial devices
- Connector for TV (RF modulator)
- Joy sticks

In addition, a carrying case and cordless keyboard overlays are available.

Physical Specifications (system unit):

Width - 354mm (13.9 in)
Depth - 290mm (11.4 in)
Height - 97mm (3.8 in)
Weight - less than 9 pounds with diskette drive; less than 6 pounds without diskette drive

Physical Specifications (keyboard):

Width - 342mm (13.5 in)
Depth - 168mm (6.6 in)
Height - 26mm (1.02 in)

IBM Canada Ltd.

(CANADA ONLY > MACHINES <)

M 4860.2
DEC 86

Weight - 616 grams (22 oz.) without batteries; 700 grams (25 oz.) with batteries

Operating Environment:

Temperature (system on): 16 to 32 degrees C (60 to 90 deg. F)
Temperature (system off): 10 to 43 degrees C (50 to 110 deg. F)
Temperature (storage): 0.6 to 60 degrees C (33 to 140 deg. F)
Temperature (shipment): -40 to 60 degrees C (-40 to 140 deg. F)
Relative Humidity (system on): 8% to 80% RH
Relative Humidity (system off): - 8% to 80% RH
Transformer operating: Altitude to 7,000 feet.

Warranty Service: Provided under the Agreement for Purchase of IBM Machines as amended by the Amendment for IBM Service/Exchange Center Services. Such service is provided, at no additional charge, under the Customer Carry-In Repair offering. The warranty period is one year. Machines installed on or prior to August 31, 1984 and that do not have the Power Expansion Attachment, the Speech Attachment or the 128K Memory Expansion Attachment installed will still have Customer Carry-In Exchange at the warranty service offering. The warranty offering for IBM PCjr System Unit installed on or prior to August 31, 1984 that do have the Power Expansion Attachment, the Speech Attachment or the 128K Memory Expansion Attachment installed is Customer Carry-In Repair. The customer may select for a fee a warranty option for IBM On-Site Repair service to be provided during the one-year warranty period.

Warranty Options: An Option which entitles the customer to service provided under the IBM On-Site Exchange Offering during the warranty period. An Option which entitles the customer to service provided under the Customer On-Site Exchange Offering during the Warranty period. Optional Periods of Maintenance Service are not available for this product.

Publications

- "Logo: Programming with Turtle Graphics" (#2229): A spiral-bound manual that explains how to construct programs using Logo and includes a step-by-step introduction to Logo turtle graphics. The manual is intended for use with IBM Logo (6024076), and is identical to the manual that is shipped with the software.
- "Hands-on BASIC for the IBM PCjr" (#2290): This manual is provided as standard with all mdls of the 4860 system unit. The manual is a primer for learning BASIC language programming. The manual may be purchased separately by ordering feature #2290.
- "IBM PCjr Guide to Operations" (#2292): Provides information on operations for users of the 4860 PCjr. This manual is shipped as standard with all mdls of the 4860 system unit. The manual may be purchased separately by ordering feature #2292.
- "IBM PCjr Technical Reference Manual" (#2293): This manual is designed to provide hardware design and interface information. The manual is intended for programmers, engineers involved in hardware and software design, designers, and interested persons who have a need-to-know how the 4860 PCjr is designed and works.
- "IBM PCjr Hardware, Maintenance, and Service Manual" (#2294): Provides step-by-step instructions that aid the user in identifying the failure of a 4860 PCjr Field Replaceable Unit (FRU). When the FRU has been identified, the manual provides the necessary information to complete the repair activity (i.e., adjustments, replacements, etc.).
- "BASIC Made Easy for the IBM PCjr" (#4116): An introduction to the BASIC programming language on the 4860 PCjr. It takes inexperienced users of the 4860 PCjr and the BASIC programming language through the more commonly used commands, statements, and functions of BASIC. The student learns by doing, and sets his or her own pace. The book is written in a friendly, conversational tone with heavy emphasis on the use

of color, sound, and examples. Once the student has completed BASIC Made Easy, it can be used as a reference book, since it contains a list of common BASIC error messages, as well as an index of BASIC programming terms. Prerequisites: Before beginning "BASIC Made Easy", the user should read the "IBM PCjr Guide to Operations" to become familiar with the keyboard. To enter examples shown in the text requires a 4860 PCjr with the BASIC Interpreter cartridge (#4101), and one of the following: A) a color TV set with the connector for TV (#0020); or, B) a color video monitor with cable.

- "IBM Personal Computer Disk Operating System (DOS) 2.1 Technical Reference" (#4125): Intended for the more experienced DOS users, system programmers, and those who will be developing their own applications. It contains detailed technical information not contained in the manuals available with DOS 2.1 (6024120).
- "IBM PCjr BASIC Reference Manual" (#4702): This manual (which is provided as standard with the BASIC Interpreter cartridge #4101) describes the full capabilities of cassette and cartridge BASIC. The manual may be purchased separately without a cartridge by ordering feature #4072.

SPECIFY

- Voltage (110V AC, 60 Hz): No specify required.

MODEL CONVERSIONS (NONE)

SPECIAL FEATURES

Diskette Drive (#0005): The Diskette Drive is a standard feature on the 4860 mdl 067. It provides for the 4860 to read and write data on both sides of a double-sided, soft-sectored 5-1/4 inch diskette. Each side of a diskette can be formatted for 40 tracks with 9 sectors per track. Formatted storage capacity is approximately 360KB. Space and power have been provided for one drive in the system unit. Included with the Diskette Drive is the diskette drive adapter which connects to the diskette drive through an internal, flat cable attached to one end of the adapter. The diskette drive parameters are programmable. In addition, the attachment supports the diskette drive's write-protect feature. The adapter is buffered on the I/O bus and uses the system read-only memory BIOS (basic input/output system). Diskettes created on any member of the IBM Personal Computer family may be read on any other member of the family. Technical Information: 512 bytes/sector --- 9 sectors/track --- 48 tracks/in. track density --- 2 sides --- 40 tracks per side (80 total) --- 300 RPM --- 6ms track to track access time --- 250K bits/sec data transfer rate --- maximum operating altitude 7,000 feet above sea level --- dimensions -- height, 41.6mm (1.6 in.); width, 146mm (5.8 in.); depth, 208mm (8.3 in.); weight, 1.1kg (2.2 lbs). Maximum: One. Field Installation: Yes. Prerequisites: 4860 mdl 004. IBM Personal Computer DOS 2.1 (6024120) is required. It is recommended that the 64KB Memory and Display Expansion (#0007) be installed on diskette-based systems. Customer Setup: Yes.

Power Expansion Attachment (#0006): The Power Expansion Attachment feature consists of a side-attached power supply module and a stand-alone 56-volt/ampere stepdown transformer unit. The power supply module provides an additional 20 watts of power and attaches to the right side of the 4860 System Unit via four screws. When installed in a 4860 configuration, this feature must be the first side-attached feature installed. The power supply module is 32mm (1.26 in.) deep, 290mm (11.42 in.) wide, and 96.5mm (3.8 in.) high. The transformer attaches to the back of the power supply module via its attached cable and plugs into an electrical outlet via its attached power cord.

This feature provides additional power for a 4860 configuration, permitting any combination of up to three of the following side-attached features to be connected to the side of the 4860 unit after installation of the Power Expansion Attachment:

- 128Kb Memory Expansion Attachment (three maximum)

- Parallel Printer Attachment (one maximum)
- Cluster Attachment (one maximum)
- Speech Attachment (one maximum)

One 128Kb Memory Expansion Attachment, one Parallel Printer Attachment, or one Speech Attachment feature can be attached to any 4860 unit without installation of the Power Expansion Attachment feature. In Addition, one Cluster Attachment can be attached to a 4860 Model 4 that does not have a diskette drive, Parallel Printer Attachment, or 128Kb Memory Expansion Attachment installed.

The Power Expansion Attachment feature is required for the following:

- To attach two or three of the other optional side-attached features (128Kb Memory Expansion Attachment, Parallel Printer Attachment, Cluster Attachment, and Speech Attachment)
- To attach the Cluster Attachment to any 4860 Model 67 (which has a standard diskette drive) or to a 4860 Model 4 to which a diskette drive has been added.

64KB Memory and Display Expansion (#0007): The 64KB Memory and Display Expansion is a standard feature on the 4860 mdl 067. This option permits the use of higher density video modes and 80-column text support while increasing the system memory size by 64KB for a total of 128KB (including 16KB video buffer). The option is a shielded adapter card containing eight 64K-by-1, 150ns, dynamic memory modules which plugs into a 44-pin connector on the system board. Parity checking is not supported. The memory and display expansion does not require the user to reconfigure the system to recognize the additional memory. Maximum: One. Field Installation: Yes. Prerequisites: 4860 mdl 004. Customer Setup: Yes.

Internal Modem (#0008): Provides for full-duplex asynchronous communication over 2-wire, switched network channels (normal household telephone installation). The Internal Modem plugs into the modem connector on the system board and does not require the use of the system unit serial port. Auto/manual answer --- auto/manual originate --- direct connection to telephone line uses modular phone jack (USOC RJ11) - modem cable is included --- auto dial Touch-tone* (* Touch-tone is a trademark of AT&T) or pulse by software command --- compatible with Bell 103 series modems --- call progress reporting --- dial tone, ring-back tone, and busy-tone detection --- fully programmable serial-interface characteristics: 7- or 8-bit characters; even-, odd-, or no-parity bit generation and detection; one stop-bit generation; baud rate generation (110 bps or 300 bps); false start-bit detection --- complete status reporting capabilities --- line-break detection --- internal diagnostic capabilities: loopback controls for communications link fault isolation; break, parity, overrun, framing error simulation --- fully-prioritized interrupt system controls. Maximum: One. Field Installation: Yes. Prerequisites: Customer-provided modular telephone jack connected to the telephone system. Customer Setup: Yes.

Parallel Printer Attachment (#0009): Supports attachment of the 5152 mdl 002 Graphics Printer or equivalent. Attaches to the I/O bus on the right side of the system unit and presents the I/O bus at its right side for additional attachments. Dimensions: Height 76mm (3 in.); length 244mm (9.6 in.); weight 12 oz. Maximum: One. Field Installation: Yes. Prerequisites: Printer cable (#5612) is required for attachment of a printer. Limitations: When the Parallel Printer Attachment is present, the 4860 PCjr directs print output only to this attachment. Customer Setup: Yes.

Attachable Joy Stick (#0010): This option is an input device which provides the user with 2-dimensional positioning control. Two momentary contact pushbutton switches on the joy stick give the user additional input capability. Two modes of operation are available. In the "spring return" mode, the stick will return to the center position when released. The "free floating" mode allows smooth, force-free operation with the stick remaining in position when released. Selection of these modes can be made for each axis independently. Two controls are provided for individual adjustment to the electrical center of each axis. Maximum: Two. Field Installation: Yes. Customer Setup: Yes.

Keyboard Cord (#0012): Connects the cordless keyboard to the system unit, giving power to the keyboard and serially encoded data

to the system unit. When connected, it disengages the battery power, disables the infrared circuit in the keyboard, and disables the infrared receiver in the system unit. System performance with or without the cord is the same. Length: 1.8m (6 ft.) straight cord. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Cordless Keyboard Overlays (#0013): Provided for those users who may want to customize their 4860 PCjr keyboard. This option includes five overlays in one package. An overlay fits between the keyboard keys and covers the preprinted symbols. Overlays may be customized by writing on them, by typing on them, or by having them printed commercially. The overlays are made of blank heavy stock paper and are scored so that they may be easily folded for storage and distribution.

Connector for TV (#0020): Allows the 4860 PCjr to use a standard home television set as an output device. This option connects to the VHF terminals of the television set and has a selection switch that allows the TV to be used in either a "computer" or "TV" mode. The Connector for TV plugs into the system unit. Supports TV sets made for operation in U.S. or Canada. Includes sealed RF modulator certified within the limits for an FCC class-B computing device for operation on TV channel 3 or 4. Weight: 12.5 oz. Prerequisites: A user-supplied television set is required. For connection to cable TV and in "TV" mode, a user-supplied 75-ohm to 300-ohm converter may be required. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Adapter Cable for IBM Color Display (#0021): Allows for attachment of the 5153 mdl 001 Color Display. Provides one connector to match the 5153 mdl 001 Color Display cable connector, and another to match the 4860 PCjr system unit display attachment connector. Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Adapter Cable for Cassette (#0022): Allows for attachment of a user-supplied cassette recorder/player to the cassette connector on the rear of the system unit for storage of programs and data. Maximum: One. Field Installation: Yes. Prerequisites: A user-supplied cassette recorder/player is required. Cassette recorder/player to be connected requires all of the following type connectors (or equivalent): Belden Style-51 miniature phone-plug (auxiliary); Belden Style-51 miniature phone-plug (earphone); Belden Style-56 subminiature phone-plug (remote). Customer Setup: Yes.

Carrying Case (#0023): The Carrying Case has been made especially for the owner who occasionally wishes to safely, securely, and conveniently move or store the PCjr. The case is black with a lightly textured surface. A 3-digit combination lock aids in protecting the system. The lock combination can easily be changed by the owner. The carrying case will fit under many airline seats. The case has the capacity for: PCjr system unit; parallel printer attachment; connector for TV; cordless keyboard; keyboard cord; transformer and power cord; up to five diskettes; up to four program cartridges. Limitations: The Carrying Case should not be used as a shipping container. It is intended only to provide hand transportation or storage of the 4860 PCjr. The original packing material should be retained for shipping the system.

Adapter Cable for Serial Devices (#0026): Allows connection of PCjr system unit to serial devices such as printers and modems. A male RS-232-C connector on one end of this short cable matches standard D-type 25-pin serial device cable connectors, and a connector on the other end matches the PCjr system unit serial device attachment connector. Connection is provided for the following typical RS-232-C signal pins: transmit data, receive data, request-to-send, clear-to-send, data set ready, signal ground, carrier detect, data terminal ready. The cable length is 72mm (3 in.). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

Mouser Cartridge (#4087): A fast-paced, arcade-type cartridge game for the PCjr system in which the player is cast in the role of a farmer whose 9-room farmhouse has been overrun by mice. The object of the game is to trap, within the allotted time, all of the mice in the rooms by building traps with movable walls. To clear all of the rooms requires skill, strategy, and dexterity. Some of the rooms are not lit, and the player must locate a flashlight that can be used to illuminate a portion of the room. On the higher levels, the mice re-

produce themselves as the player is attempting to trap them. The farmer loses by running out of time or by touching a mouse. Points are awarded for each mouse trapped. The total score depends on how fast the player traps the mice. 1- or 2-player mode --- player movement with either joy stick or keyboard --- full 16-color graphics --- three-voice music and sound effects --- pause game feature --- displays high score --- nine screens --- multiple levels of difficulty. Prerequisites: Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Scubaventure Cartridge (#4088): An action-packed, arcade-type game cartridge designed to run on the PCjr system. Here, each player is in control of a 3-diver expedition team that is searching the dangerous recesses of an undersea cavern for sunken treasure. Each expedition sends one diver at a time to brave the treacherous waters to collect rare fish, to avoid poisonous fish and electric eels, and to find keys to open the treasure chests. Unlike many other arcade games, two players may play simultaneously, competing for the same rare fish and for survival. Played in 1-player mode, a ghostly white diver with a strange knack for being in the wrong place at the right time accompanies you. Points are awarded for each chest opened and for each rare fish collected. 1- or 2-player mode --- simultaneous play in two-player mode --- player movement with either joy sticks or keyboard --- pause game feature --- full 16-color graphics --- 3-voice sound. Prerequisites: Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Crossfire Cartridge (#4091): An exciting, arcade-type game cartridge in which the player must defend the grid-like streets of a city from the onslaught of a swarm of insects. Fortunately, the player has a fleet of three ships containing insecticide missiles to clear the streets. A bonus ship is awarded every 5,000 points. The object is to clear the town of these enemies, but, with a limited supply of ammunition and invaders coming from all directions, this is not an easy task. Points are awarded for each invader hit and for bonus targets that occasionally appear in the streets. Player movement with either keyboard or joy stick --- pause game feature --- sound on/off feature --- game restart control --- full 3-voice sound --- current high score maintained --- three difficulty settings --- full-color graphics. Prerequisites: Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Mine Shaft Cartridge (#4092): A fast-paced, action-packed game cartridge in which the player maneuvers a mining car around dangerous mine shafts looking for a fortune in diamonds. In addition to the twisty, treacherous shafts, there are a number of runaway robot

miners that seem bent on destruction of the mining car. Disabling the robots and collecting diamonds earn the player points. Clearing either all of the diamonds or all of the robots out of one mine shaft will allow the player to explore the next level. Player movement with either keyboard or joy stick --- pause game feature --- sound on/off feature --- game restart control --- full three-voice sound --- current high score maintained --- full-color graphics. Prerequisites: Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

BASIC Interpreter Cartridge (#4101): Provides extensions to the PCjr built-in Cassette BASIC interpreter. Extensions to the language provide a full set of instructions, commands, and functions. Most of these can be used with or without DOS present. The "IBM PCjr BASIC Reference Manual" is provided with cartridge BASIC and describes the full capabilities of cassette and cartridge BASIC. Superset of advanced BASIC on the 5150 Personal Computer and the 5160 Personal Computer XT --- improves programmer productivity by reducing the need for special machine-language subroutines --- compatible with IBM Personal Computer DOS 2.1 --- current date and time of day (DOS must be present for these functions) --- path name support for tree-structured directories (DOS must be present for these functions) --- event trapping of communications, function key, joy stick, light-pen, music, and timer activity --- stores and plays musical notes --- advanced graphics: Paint, circle, get/put display contents, store and draw line segments, line styling, tiling, viewports, windows, and palette control --- supports one parallel printer --- provides a terminal emulator for asynchronous communications --- ability to load and run a BASIC program in a second cartridge slot. Prerequisites: Minimum configuration required is 4860 mdl 004 with attachment of a supported display type. IBM Personal Computer DOS 2.1 (6024120) is required for diskette input/output operations.

Printer Cable (#5612): Provides for the attachment of a 5152 mdl 002 Graphic Printer or equivalent to the Parallel Printer Attachment (#0009). Maximum: One. Field Installation: Yes. Customer Setup: Yes.

ACCESSORIES (NONE)

SUPPLIES (NONE)

4865 3.5 INCH EXTERNAL DISKETTE DRIVE

PURPOSE

The IBM PC 3.5 Inch External Diskette Drive (machine type 4865) enhances the IBM Personal Computer product line by making available an external diskette drive which uses the increased capacity of the 3.5 inch diskette media.

Attachment of the 4865 Diskette Drive not only increases the data storage capacity of the user, but adds the ability to interchange this data between IBM Personal Computers with 5.25 inch diskette drives, and IBM Personal Computers with 3.5 inch diskette drives. It also expands the I/O capabilities of some system units by increasing the maximum number of available diskette drives by one.

MODELS

Model 001: Attaches to all models of the IBM PC, PC XT or the PPC.

Model 002: Attaches to all models of the IBM PC AT.

Prerequisites: The user must have Disk Operating System (DOS), Version 3.2 on 5/25 inch media for proper operation of the 3.5 inch External Diskette Drive. Also the Host unit must be equipped with the parts required to provide power to the external unit. The prerequisite parts are included with the 3.5 inch Diskette Drive.

Customer Set-Up: Yes. CSU allowance is one day. IBM set up is available at the applicable IBM hourly service rates and minimum charges.

HIGHLIGHTS

- Data/Media Interchange between current IBM Personal Computer Family members and the 5140 PC Convertible.
- Program Product execution and backup.
- Expanded I/O Capability.

DESCRIPTION

4865 Model 001: The 4865 Model 001 3.5 inch External Diskette Drive is designed to attach to the IBM PC, PC XT, or PPC. The 4865 has a permanently attached 36 inch signal/power cable that attaches directly to the existing 5.25 inch diskette drive adapter on the system unit.

Power from the system unit is redirected through an internal power split cable that is provided with the unit. This power split cable is customer installable and makes power externally available to the 3.5 inch External Diskette Drive.

4865 Model 002: The 4865 Model 002 3.5 inch External Diskette Drive is designed to attach to the IBM PC AT. It connects to an existing IBM Combination Disk/Diskette Drive adapter through a special external diskette drive adapter card. The adapter card is provided with the 4865, and must be customer installed in the system unit expansion slot 6 or 7.

A flat signal cable, included with the 4865, is used to internally connect the external diskette drive adapter card to the combination disk/diskette drive adapter. The Model 002 is connected to the external diskette drive adapter. Connection is via a combination signal/power cable. This 36 inch cable is permanently attached to the 4865.

Power for the Model 002 is obtained from the external diskette drive adapter card. A special internal power split cable, which is provided with the unit, provides power to the adapter card.

The 4865 Model 002 provides the same functions for the IBM PC AT that the Model 001 provides for the IBM PC, PC XT and PPC.

Standard Specifications:

- Formats 3.5 inch double sided diskette with 80 tracks, 9 sectors per track
- Stores approximately 720KB of data
- Interface signals and timings correspond to the ANSI standard for a 5.25 inch diskette drive
- Data transfer rate is 250K bits per second
- Access speed is only 6ms for track to track
- Head settle time is 15ms
- Weight is 1.54 kilograms (3.4 lbs.)
- Dimensions:
 - Height - 119mm (4.69 in.)
 - Width - 55mm (2.17 in.)
 - Depth - 210mm (8.27 in.)
- Certified as FCC Class B
- Power provided by the Host System

Diskettes: The IBM Personal Computer 3.5 Inch External Diskette Drive utilizes a new form of media: "IBM 3.5 Inch Diskettes -- double sided 2HC Inch, high capacity (720KB) diskettes. Each diskette is housed in a rigid plastic case containing a built-in write protect switch. The diskette design includes an integrated protection mechanism (metal, spring loaded, slide cover) for the area of diskette which will be accessed by the read-write heads of the unit diskette drive.

Prerequisite - Software: IBM Personal Computer Disk Operating System (DOS) Version 3.2 is required to operate the IBM PC 3.5 inch External Diskette Drive. Previous DOS versions will not support the new diskette units.

Initial program loading (IPL) from the IBM Personal Computer 3.5 inch External Diskette Drive is not supported by the IBM PC, PC XT, PPC or PC AT. Consequently, users of these system units will require DOS 3.2 on the 5.25 inch diskette medium for operation of an External Diskette Drive.

Optional Software Supported: In an effort to provide the largest possible base of software applications for the new hardware, IBM has designed the hardware and the new version of DOS (3.2) to be as compatible as possible with the existing products.

IBM PC Program Products are planned for availability on the 3.5 inch diskette media to support the 3.5" External Diskette Drive.

Customer Responsibilities: The customer is responsible for unpacking and setting up the IBM PC 3.5 inch External Diskette Drive. Set-up instructions are provided in the IBM Personal Computer Guide To Operations Update Package, which is included with each IBM PC 3.5 inch External Diskette Drive.

COMPATIBILITY

Hardware: All models of the PC, PC XT, PPC and PC AT were used as HOST in testing the External Diskette Drive. In addition, the following options were tested on one or more of the above hosts:

SPECIFIED OPERATING ENVIRONMENT

Hardware Requirements

Either model of the 4865 is fully functional when taken directly from the shipping carton and installed, as directed in the installation and setup instructions, to a supported host.

Software Requirements

IBM Personal Computer Disk Operating System (DOS) Version 3.2 will be available in two separate packages:

- 6280058 - on 3.5 inch diskettes, and
- 6280057 - on 5.25 inch diskettes

The user must have Disk Operating System (DOS), Version 3.2 on the 5.25 inch media for proper operation of the IBM PC 3.5 Inch External Diskette Drive. Also the Host unit must be equipped with the parts required to provide power to the external unit. The prerequisite parts are included with the 3.5 inch Diskette Drive.

PC Expansion Units, both models

Displays plus their adapters:

- Monochrome
- Enhanced Color
- Color Graphics

Memory Expansion Options:

- 128KB
- 256KB
- 512KB

Miscellaneous Adapters:

- Asynchronous Communication
- Voice Communication Option
- Serial/Parallel
- PC Network

- 3278/79 Emulation
- Fixed Disk
- Parallel Printer
- Math Co-Processor (80287)
- Math Co-Processor Option
- Diskette Drive
- Game Control

SECURITY/INTEGRITY

The user, and/or user management, is responsible for evaluation, selection, and implementation of security features, establishment of administrative procedures, and for appropriate controls in application systems.

PERFORMANCE CONSIDERATIONS

The IBM PC 3.5 Inch External Diskette Drive performance depends upon the number and types of devices installed on the host unit and their respective power requirements.

PACKAGING

The IBM PC 3.5 Inch External Diskette Drive is packaged in a single carton which includes:

- Model 001
 - 3.5 Inch External Diskette Drive with permanently attached signal/power cable
 - Power Split Cable
 - Cover plate (PC)
 - Cover plate (PC XT)
 - Expansion slot cover (Portable PC)
 - Update packages for PC, PC XT, PPC Guide To Operations Manual (includes one 5.25 inch diagnostic diskette)
- Model 002
 - 3.5 inch External Diskette Drive with permanently attached signal/power cable
 - Power Split Cable
 - External Diskette Drive Adapter
 - Flat signal cable
 - Update package for PC AT Guide To Operations Manual (includes one 5.25 inch diagnostic diskette for 4865, plus one 5.25 inch special 4865 driver diskette)

DOCUMENTATION

Each IBM PC 3.5 Inch External Diskette Drive shipment will include updates to the Guide To Operations Manual provided with the System Unit, a system diagnostic diskette and, for the 4865 Model 002, a special 4865 driver diskette.

Guide to Operations (GTO)

4865 Model 001 - 6280784
4865 Model 002 - 6280774

The Guide To Operations manual summarizes the capabilities of the IBM Personal Computer and explains the operations of the various options. It also includes a brief description of each component and explains the Problem Determination Procedures.

The following publications will be sold separately:

Technical Reference Manual Update Packages

Tables - 6280780
Storage Devices - 59X9945
Adapters - 59X9946

These Manual Update Packages consist of update pages to the Technical Reference Manual for the PC, PC XT, PPC and PC AT. The Technical Reference Manual is designed to provide hardware design and interface information. These manuals are intended for programmers, engineers involved in hardware and software design, designers, and interested persons who have a need to know how the IBM Personal Computer is designed and works.

Hardware Maintenance and Service Manual Update Package

For IBM PC - 6280801
For IBM PC XT - 6280819
For IBM PPC - 6280831
For IBM PC AT - 6280811

These packages will consist of update pages for the Hardware Maintenance and Service Manual for IBM Personal Computers plus an advanced diagnostic diskette.

This publication for service personnel details many aspects of troubleshooting the unit. It includes instructions for identifying the failure of a replaceable component in addition to a complete parts catalog.

Warranty Period: The IBM PC 3.5 Inch External Diskette Drive has a twelve (12) month warranty from the date of customer purchase.

Warranty Service: Customer Carry-in Exchange (CCE) service is provided during the warranty period for the 3.5 inch External Diskette Drive.

Warranty Options: IBM On-Site Exchange (IOE) and Customer On-Site Exchange (COE) will be available as Warranty Upgrade options. These service offerings are described under the terms and conditions of the Agreement for Purchase of IBM Machines (Z120-2892).

Authorized Personal Computer Dealers and Value Added Dealers are required to provide customer carry in warranty service as specified in their Dealer Agreements.

Authorized Personal Computer Dealers and Value Added Dealers will receive Warranty Reimbursement at the rates published in the Service Support Guide. Machine Type 4865 should be used when submitting reimbursement requests for this product.

Maintenance Service: Maintenance service is available under the IBM Maintenance Agreement. The following services, as described in the "Information Bulletin for Customers - IBM Service/Exchange Center Services and Associated On-Site Services" (G125-3488), are available:

IBM On-Site Exchange (IOE)
Customer On-Site Exchange (COE)
Customer Carry-In Exchange (CCE)

Volume Maintenance Service will be available for qualifying customers under the IBM Volume Maintenance Agreements (V125-3777, 3778, and 3779).

Dealer Service Option: A twelve (12) month Dealer Service Option is available for the IBM PC 3.5 Inch External Diskette Drive.

Hourly service may be obtained by calling the IBM Service/Exchange Communications Center's toll free number 1(800)428-2569. The center will direct the customer to carry or mail the failing unit to a Service/Exchange Center providing time and material service.

4869 PERSONAL SYSTEM/2 5.25-INCH EXTERNAL DISKETTE DRIVE

PURPOSE

The 4869 Personal System/2 5.25-Inch External Diskette Drive enhances the Personal System/2 line by making available an external diskette drive that uses the 5.25-inch diskette media.

The 4869 allows users to transfer data files and execute programs that follow DOS and BIOS procedures from 5.25-inch media. The 4869 is a replacement for drive B and operates in the same fashion as an IBM system drive B.

MODELS

Model 001

Limitations: The 4869 does not support 1.2Mb 5.25-inch diskette media or diskettes prepared on 1.2Mb drives even when a 360Kb format is used. The 4869 has a maximum formatted capacity of 360K bytes per diskette.

Customer Setup (CSU): The 4869 and the IBM Personal System/2 special features are customer setup. Setup instructions are included.

HIGHLIGHTS

- Can be used for data storage and/or program execution.
- Same standard functions as the 3.5-inch diskette drive (format, read, and write).
- Data transfer rate is 250K bits per second.
- Access speed is 6ms; track to track.
- Head settle time is 15ms.

Standard Features: The 4869 has the following standard features:

- One 5.25-inch 360Kb diskette drive (half-high)
- Universal power supply (Auto-sensing for line frequency and voltage)
- One-year warranty
- Supports features internally installed as drive B for the 8530-021, 8550, 8560, and 8580 systems.

DESCRIPTION

The 4869 enhances the IBM Personal System/2 product line by making available an external diskette drive that uses the 5.25-inch diskette media. The 4869 allows users to transfer data files and execute programs that follow DOS and BIOS procedures from 5.25-inch media. The 4869 is a replacement for drive B and operates in the same fashion as an IBM system drive B.

Physical Specifications:

Width: 227mm (8.94 in.)
 Depth: 408mm (16.06 in.)
 Height: 62.5mm (2.46 in.)
 Weight: 4.6kg (10 lbs.)

Operating Environment:

Temperature: 15.6 to 32.2C (60 - 90F)
 Relative Humidity: 8 to 80 percent
 Maximum Wet Bulb: 22.8C (73F)

Publications: The following publications are shipped with the 4869, or accessory as appropriate, and are not available separately:

- (P/N 6280167) Diskette Drive Operating Instructions
- (P/N 6280213) Diskette Drive Adapter Installation Instructions
- (P/N 6280209) Diskette Drive Adapter/A Installation Instructions

Separately Available Reference Materials: The following publications are available for sale, and can be obtained by contacting an Authorized IBM Personal Computer Dealer or an IBM Sales Representative. They may also be obtained through the "Technical Directory", a copy of which is included with the initial system documentation. Please see the directory for details.

- S68X-2272 (P/N 68X2272) IBM Personal System/2 5.25-Inch External Diskette Drive Technical Reference
- S68X-2273 (P/N 68X2273) 5.25-Inch External Diskette Drive Supplements for the Hardware Maintenance Library

National Language Support (NLS): The publications listed will be available in the following languages: Danish; Dutch; English (UK); Finnish; French; German; Italian; Norwegian; Portuguese; Spanish, and Swedish.

- Diskette Drive Operating Instructions
- Diskette Drive Adapter Installation Instructions
- Diskette Drive Adapter/A Installation Instructions

4950 SYSTEM UNIT

(NO LONGER AVAILABLE)

PURPOSE

The 4950 System Unit is an entry level Series/1 product integrated with a Personal Computer XT. Within the Mdl A System Unit is a Series/1 microprocessor with 256K bytes of memory, a PC XT microprocessor functioning as an I/O controller, a PC keyboard, 10 10MB fixed disk drive, a 320KB diskette drive, and a terminal/host attachment card capable of attaching up to four IBM 3101 (Mdl 13, 23, or 881), 3161 Mdl 12, or 3163 Mdl 12 display stations via RS-422 (local) ports.

MODELS

MODEL A A00: System Unit, 256KB Memory, 10MB Fixed Disk Drive, Fixed Disk Drive Adapter, 320KB Double-Sided Diskette Drive, Diskette Drive Adapter, Terminal/Host Attachment Card, and PC Keyboard.

MODEL B B00: System Unit, 256KB Memory, 320KB Double-Sided Diskette Drive, Diskette Drive Adapter, Terminal/Host Attachment Card, Expansion Unit Attachment Card.

Prerequisites: A 5151 Monochrome Display Mdl 001 (or equivalent) and the Monochrome Display and Printer Adapter (#4900).

For 4950 mdl B00: A 5161 Expansion Unit, mdl 003.

Series/1 I/O Executive (5719-EM1).

Customer Setup (CSU): All models and special features of the 4950 System Unit are customer setup.

For additional information on CSU, contact IBM.

HIGHLIGHTS

- Entry priced Series/1 integrated with Personal Computer XT:
 - Series/1 microprocessor executes Series/1 programs
 - PC XT microprocessor controls I/O devices
- Included with the 4950 are:
 - Terminal/Host Attachment card (one maximum)
 - 10 megabyte fixed disk and adapter
 - 320 kilobyte diskette and adapter
 - Personal Computer Keyboard
- Terminal/Host Card supports up to four 3101 Display Stations (mdls 23, 13, or 881), 3161 or 3163 Display Station (mdl 12).
- Three feature slots available for additional functions
- Series/1 memory expandable to 512K bytes in 128K byte increments.
- Performs Series/1 floating point instructions - reduced speed.
- Up to two IBM 4971 printers may be attached.
- Asynchronous or BSC or SDLC communications options.
- IBM Expansion Unit 5161 mdl 003 provides additional DASD for the 4950 mdl A.
- Required IBM Personal Computer Monochrome Display (or equivalent) and standard keyboard: Used as a system console, or provides features of IBM 3101, , 3161, and 3163 Display Station in block mode.
- Can function as a stand-alone Personal Computer XT.

- The following table shows the slot utilization and memory on the system board for the 4950:

SLOT NO.	TYPE	MODELS		DESCRIPTION
		A00	B00

- Additional Series/1 memory increments of 128KB are available. Two additional memory increments can be installed on the S/1 CPU card.
- Additional Personal Computer memory increments of 64KB are available via the 64/256KB Memory Expansion Option (#1013). Personal Computer XT storage in the 4950 is limited to 512KB.
- Further expansion is available with a 5161 Expansion Unit. The 5161 mdl 002 is an expansion unit for the 4950 mdl A00. The 5161 mdl 003 is an expansion unit for the 4950 mdl B00. The 5161 mdl 003 contains eight option slots, two 10MB fixed disk drives and fixed disk adapter. The 5161 mdl 002 contains an additional 10MB Fixed Disk Drive and eight option slots. Upon installing the mdl 002 Expansion Unit, the Fixed Disk Drive and Fixed Disk Drive Adapter in the 4950 must be moved into the Expansion Unit for a total of 20MB (two 10MB Fixed Disk Drives) in the Expansion Unit. An additional diskette drive may then be installed in the 4950, resulting in a maximum configured system of 20MB Fixed Disk, 720KB diskette, and 512KB Series/1 user storage. When an Expansion Unit is attached to the 4950, one slot in each unit is occupied by an attachment card.
- One 10MB Fixed Disk Drive is standard in the 4950 mdl A00. The disk drive has the same physical dimensions and mounting as the 320KB diskette drive. Technical Information: 512 bytes per sector --- 17 sectors per track --- 306 tracks per surface --- 4 surfaces --- 3,600 rpm --- 90ms average access time --- 5M bit per second transfer rate.
- One Fixed Disk Drive Adapter is standard on the 4950 mdl A00. The Fixed Disk Drive Adapter can attach up to two 10MB Fixed Disk Drives. Technical Information: 32-bit error-correcting code --- microprocessor controlled --- on-board sector buffers --- internal diagnostics --- direct memory access (DMA) data transfer --- high-level command set --- automatic error detection and correction --- automatic retries on disk access. Maximum: One adapter per system.
- One 5-1/4 in. Diskette Drive Adapter provides for the attachment of up to two 5-1/4 in. diskette drives. The adapter is a standard feature on the 4950. Maximum: One adapter per system.

- One 5-1/4 in. Double-Sided Diskette Drive is standard. Allows the 4950 to read and write data on both sides of a soft-sectored 5-1/4 in. diskette. Formatted storage capacity is approximately 320KB (360KB with IBM Personal Computer DOS 2.0). The diskette drive has the following characteristics: Track density = 48 tracks per inch --- number of tracks = 40 per surface --- data surfaces = 2 per diskette --- rotational speed = 300 rpm --- access time = 6ms track-to-track --- data transfer rate = 20,480 bytes per second. The 5-1/4 in. Double-Sided Diskette Drive resides in the 4950 to provide diskette access from the front.
- Dimensions (approximate):
 - Height - 142mm (6 in.)
 - Width - 500mm (20 in.)
 - Depth - 410mm (16 in.)
 - Weight (approximate): 14.5kg (32 lbs.)
- Some of the options available for the 4950 System Unit include:
 - Asynchronous Communications Adapter
 - Binary Synchronous Communications Adapter
 - SDLC Communications Adapter
 - Attachment of up to two 4971 Printers
 - Four 3101s (mdl 23 , 13, or 881), 3161 or 3163 Display Station (mdl 12.)
- For options supported in Personal Computer mode, see M5160 pages.

Performance: Series/1 4950 system performance depends upon the number and type of devices attached to the system, the operating characteristics selected for those devices, and the types of application programs being used. Performance testing has indicated that the Series/1 4950 system unit with from one to four terminals and limited communications, provides satisfactory throughput and response times for an entry level system. Communication lines, bi-synchronous and SDLC, operate at speeds up to 4800 bits per second. Guidance on performance in specific application environments is available from your IBM representative.

Bibliography: "IBM Series/1 4950 Guide to Operations", SX34-0148: This publication provides installation and reference information for the IBM Series/1 4950 System Unit and associated features and options. The information in this book is intended to guide the 4950 operator who does not have special training or experience in computers.

"IBM Series/1 4950 Maintenance Information Manual", SX34-0149: This manual contains maintenance information for the IBM Series/1 4950 System Unit. Description and procedures are providing to support the system at the field-replaceable-unit (FRU) level. The information in this manual is intended for use by IBM representatives (CSRs) and customer service personnel who are experienced in the maintenance of similar computer systems.

SPECIFY

Industrial Automation Systems Specify: Plant Floor Systems (#9010): Collection or dissemination of data using plant floor terminals requiring human intervention, time and attendance, job reporting, etc., as well as automatically collected and disbursed data to and from programmable controllers, process controllers, etc. Also includes power management systems.

SPECIAL FEATURES

64KB Memory Module Kit (#1003): Provides a 64KB increment of parity-checked random access memory which may be plugged into sockets on the 4950 CPU board or the 64/256KB Memory Expansion Option (#1013). Maximum: Up to four 64KB Memory Module Kit increments may be installed on the CPU board to provide an additional 256KB. The 64/256KB Memory Expansion Option provides 64KB of memory as standard. Up to three 64KB Memory Module Kit

increments may be customer-installed on a 64/256KB Memory Expansion Options to provide an additional 192KB of memory. Field Installation: Yes. Prerequisites: Available sockets on the 4950 CPU board or available sockets on a 64/256KB Memory Expansion Option. Must be installed in 128KB increments on 4950 CPU board. Customer Setup: Yes.

64/256KB Memory Expansion Option (#1013): Increments I/O controller memory by 64KB and is easily expandable to 256KB by plugging in additional increments of 64KB with 64KB Memory Module Kits (#1003). The 64/256KB Memory Expansion Option is packaged as a circuit card designed to plug into one of the 4950's full-feature system expansion slots. Technical Information: Random access memory --- starting address is set by switches --- 250ns access time --- 410ns memory cycle time --- parity checking --- sockets for expansion to 256KB. Limitations: The System Unit supports a maximum of one 64/256KB Memory Expansion Option due to physical limitations. The 64/256KB Memory Expansion Option must be installed in the 4950 System Unit and not in a 5161 Expansion Unit. Maximum: One. Field Installation: Yes. Prerequisites: An available full-feature system expansion slot is required for the 64/256KB Memory Expansion Option. Customer Setup: Yes.

Asynchronous Communications Adapter (#2074): Provides a channel to data processing or I/O devices outside of the immediate system. Such devices can be connected by telephone using a plug-in modem, or directly by cable when the device is nearby. Communication may be to a host computer, another Series/1, a 5150/5160, a communicating typewriter, a laboratory instrument, or other machines with an RS-232-C asynchronous interface. Program selects appropriate speed (300-9600 bps), format (5-, 6-, 7, or 8-bit characters), parity and stop bits to properly interface to the attached device. One 25-pin "D" shell, male-type connector is provided to attach peripheral devices. A current-loop interface is provided in the same connector. A jumper block is provided to select the voltage or the current-loop interface. Limitation: Cannot be installed if either a BSC or SDLC Communications Adapter is included in the system. Current-loop interface is not supported by the Series/1 I/O Executive licensed program. Maximum: Two. Cable: A user-supplied communication cable is required for connection of external modems or other devices to the Asynchronous Communications Adapter. Field Installation: Yes. Prerequisites: An available special-feature (small) or full-feature system expansion slot is required. Customer Setup: Yes.

Binary Synchronous Communications (BSC) Adapter (#2075): The BSC Adapter provides the ability for a 4950 attached to a host system via communications lines to participate in a network using BSC protocol. The network may be either switched or nonswitched line. Technical Information: EIA RS-232-C interface --- operates at up to 4800 bps switched or nonswitched line support --- provides modem control functions --- facilitates program controlled data transfer --- supports electrical wrap and error status reporting --- prioritized interrupt system controls. Limitations: Only one BSC Adapter or SDLC Adapter may be installed on the same system. Maximum: One. Cable: The Communications Adapter Cable (#2067) allows the user to connect the BSC Adapter card to a modem via a plug at the rear of the 4950. The cable is double-shielded and approximately 3m (10 ft) long. A wrap connector is provided to test the cable. Field Installation: Yes. Prerequisites: An available full-feature system expansion slot. An external modem must be cable-connected between the BSC Adapter and the telephone line. Customer Setup: Yes.

SDLC Communications Adapter (#2090): The SDLC Communications Adapter provides the ability for a 4950 attached to a host system via communications lines to participate in a network using SDLC protocol. Technical Information: EIA RS-232-C interface --- operates at up to 4800 bps with switched or nonswitched line support (including multipoint) --- provides modem control functions --- facilitates program controlled data transfer --- supports electrical wrap and error status reporting --- prioritized interrupt system controls. Limitations: Only one BSC Adapter or SDLC Communications Adapter may be installed. Maximum: One. Cable: The Communications Adapter Cable (#2067) allows the user to connect the SDLC Communications Adapter Card to a modem via a plug at the rear of the 4950. The cable is double-shielded and approximately 3m (10 ft) in length. A wrap connector is provided to test the cable. Field In-

stallation: Yes. Prerequisites: An available full-feature system expansion slot. An external modem must be cable-connected between the SDLC Communications Adapter and the telephone line. Customer Setup: Yes.

5-1/4 Inch Double-Sided Diskette Drive (#3810): Allows the 4950 to read and write data on both sides of a soft-sectored 5-1/4 in. diskette. Formatted storage capacity is approximately 320KB (360KB with IBM Personal Computer DOS 2.0). The diskette drive has the following characteristics: Track density = 48 tracks per inch --- number of tracks = 40 per surface --- data surfaces = 2 per diskette --- rotational speed = 300 rpm --- access time = 6ms track-to-track --- data transfer rate = 20,480 bytes per second. The 5-1/4 in. Double-Sided Diskette Drive resides inside the 4950 to provide diskette access from the front. One Double-Sided Diskette Drive is standard on the 4950. Limitations: Installation of an additional 5-1/4 in. Double-Sided Diskette Drive in the 4950 may require the removal and transfer of a previously installed 10MB Fixed Disk Drive to a 5161 mdl 002. Maximum: Up to two diskette drives may be installed in a 4950. Field Installation: Yes. Customer Setup: Yes.

Monochrome Display and Printer Adapter (#4900): Provides for the attachment of both the 5151 Monochrome Display and the 4971 Printer. The adapter provides cable connectors for attachment of the printer and the display at the rear of the 4950. Limitations: The primary monitor/display adapter must be installed in the 4950 System Unit and not in a 5161 Expansion Unit. Maximum: One. Cable: The Printer Cable (#5612) is available to connect the 4971 to the Monochrome Display and Printer Adapter. Field Installation: Yes. Prerequisites: An available full-feature system expansion slot. Customer Setup: Yes.

Printer Adapter (#5200): Provides for attachment of a second 4971 Printer or a 5152 Graphics Printer. (Note: The 5152 Graphics Printer

is not supported in Series/1 mode.) This option is used when support for more than one printer is required and the Monochrome Display and Printer Adapter is already installed. The adapter provides a connector for attachment of the printer cable to the rear of the 4950. Maximum: One. Cable: The Printer Cable (#5612) is available to connect the 5152 Graphics Printer or the 4971 to the Printer Adapter. Field Installation: Yes. Prerequisites: An available special-feature system expansion slot. Customer Setup: Yes.

Terminal/Host Attachment Card Cables/Cable Kit:

	Option Number	Feature
3101 Display Terminal, 3601 & 3603 Display Station, 1.8m (6 ft) Cable	6450400	#0400
3101 Display Terminal, 3601 & 3603 Display Station, 15m (50 ft) Cable	6450401	#0401

MACHINES
4952 PROCESSOR
PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A	A00	128KB maximum, five I/O feature locations, half-width unit. 32KB basic storage provided.
Model B	B00	128KB maximum, 14 I/O feature locations, full-width unit. 32KB basic storage provided.
Model C	C00	128KB maximum, four I/O feature locations, full-width unit. 32KB basic storage and one built-in diskette drive provided. Second diskette drive optional.
Model 30D	30D	128KB maximum, seven I/O feature locations, full-width unit. 32KB basic storage, with a 30MB disk, optional cache and optional 1.2MB diskette.

All models are designed for mounting on support rails in a 4997 Rack Enclosure (see M4997 pages) or in an EIA standard 19-inch enclosure. Models C and 30D can also be mounted in the Stand-Alone Enclosure (#4520).

Limitations: 4999 Battery Backup Unit may not be used with mdl A prior to mdl A serial number 50,000 (EC 375810). Mdl B is not supported by 4999 when primary power consumption exceeds 800VA (corrected for power factor). Contact IBM for further information. 4999 may not be used with mdl C or 30D.

Prerequisites: For mdl A, a space in Rack Mounting Fixture (#4540). See "Accessories" in the M4959 pages.

HIGHLIGHTS

The 4952 is a processor unit in the Series/1 family. It provides CPU, 32,768 bytes of main storage, enclosure, and power. It includes storage address translation function (two 64KB address spaces), clock/comparator, and communications power. Three additional storage increments of 32KB each are pluggable on the processor card. The number of feature locations is model-dependent. See "Specification Table". Standard features include rich instruction set, four interrupt levels, and power failure detect/auto-restart. There are eight general purpose registers per level and byte-addressable storage. The 4952 includes a clock/comparator with a single 32-bit register, which is incremented at one millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Mdl C provides one or two diskette drives and four I/O feature positions. The diskettes, one standard and the second an optional feature, provide the multiple functions of diskette writing and reading including input of data and programs generated offline, output of programs and data for personal or offline storage, journaling, recording of an audit trail, checkpoints, system errors, etc. Data exchange media is compatible with other systems.

Diskette Types: Either the 1-sided Diskette 1 or the 2-sided Diskette 2 or Diskette 2D may be used.

Diskette Formats: Diskettes 1 or 2 may be initialized for 128-, 256-, or 512-byte sectors. Diskette 2D may be initialized for 256-, 512-, or 1,024-byte sectors.

Diskette Capacity: Capacity of diskette is dependent upon type and format. **Note:** Actual useful capacity depends on the system software used and may be less than capacities shown here.

Bytes/ Sector	Sectors/ Track *	Diskette Type	Capacity (bytes)
128	26	1	246,272
256	15	1	284,160
512	8	1	303,104
128	26	2	492,544
256	15	2	568,320
512	8	2	606,208
256	26	2D	985,088
512	15	2D	1,136,640
1,024	8	2D	1,212,416

* 74 data tracks per surface; Diskettes 2 and 2D have two surfaces.

Diskette Drive: Access time includes 5 milliseconds per track crossed plus 35 milliseconds for head settling. Diskette rotates at 360 rpm, yielding a data rate of 62,500 bytes per second and average latency of 83.8 milliseconds.

The use of flexible diskette storage provides significant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage, etc. It should be recognized, however, that during recording and reading, the read/write head is in contact with the diskette, causing wear over time. Variations in the rate of wear will depend upon the particular operating environment and application characteristics. Care in the storage, use, and handling can also affect diskette life. See guidelines in the *IBM Diskette General Information Manual* (GA21-9182). Excessive wear, handling, or contamination can cause possible failures in recording and/or reading.

Ultimate wear is to some extent dependent upon total usage of individual tracks. Care taken to distribute data, so that accessing occurs over the entire recording surface with about the same frequency, can extend the useful life of the diskette. Actual experience with individual applications and environments will allow development of guidelines as to when the diskette should be replaced. Unpredictable circumstances, such as contamination or severe handling, can shorten useful life. For all the above reasons, consideration should be given to providing an adequate recovery plan.

Disk Drive Mdl 30D: Provides a capacity of 30 megabytes per disk drive. This mdl has an average access time of 40 milliseconds. Average rotational latency is 9.5 milliseconds. The disk rotates at 3151 rpm yielding an instantaneous data rate of 1,250,000 bytes per second. A high level of data integrity is maintained by Error Checking and Correcting (ECC) which corrects any error of nine bits or less and any error of 16 bits or less within a 2-byte boundary. Also, ECC will detect up to two 2-byte errors within any 256-byte block.

Cache Mdl 30D: The 64 kilobyte cache is microprocessor controlled and has the potential to significantly improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are pre-fetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improvements are application dependent -- test cases from a variety of applications thought to be typical have shown improvements in disk throughput ranging from 50% to above 200%. No guarantee of result can be made. Applications which are truly random (test cases found none) or which are heavily write-oriented may experience little or no improvement from a cache function.

Environmental Restrictions: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See *Customer Site Preparation Manual* (GA34-0050) for details.

Publications: *IBM Series/1 4952 Processor and Processor Features Description* (GA34-0084), *IBM Series/1 4952 Model C Processor and Processor Features Description* (GA34-0159), and *IBM Series/1 4952 Model 30D Processor and Processor Feature Description* (GA34-0251).

SPECIFY

Specify codes #2XXX, #8XXX, and #9XXX apply to plant orders only ... do not use on MES orders.

For 4952 mdl B processors with serial number greater than 15400, MES 6840342 is field installable to change any low voltage specify code to any high level specify code.

4952 Processor (cont'd)

- Voltage (AC, 1-phase):

50 Hz	60 Hz
100V #2804	100V #2730
110V #2805	110V #2822
200V #2806	115V #9901
220V #2813	120V #9911
230V #2821	127V #2823
235V #2814 *	200V #2732
240V #2801 *	208V #9902
	220V #2803

* #2801 and #2814 are equivalent.

- Power Cord: 1.8 meter (6 foot) cord, no specify required.
- Power Cord Codes: #2744 for Canada, #2747 for Japan.
- Attachment of 3101:

#2787 Designates that a 3101 Display Terminal is on order for this system and that its delivery is to be synchronized with that of the system.

- Type of Distribution Channel (specify one):

#9001 Sales to Third Party Participants (TPPs): Sales to Value Added Reseller, systems integrators, programming houses, and other equipment manufacturers (OEMs) who, in turn, resell to end-users. Includes sales to business concerns who resell to their independent franchises or distributors.

#9002 End-User Sales: Sales directly to the business concern which will use the system for the intended application.

- Primary Application (specify one):

Industry Terminal Systems:

#9010 Plant Floor System: Collection or dissemination of data using plant floor terminals requiring human intervention. Time and attendance, job reporting.

#9011 Banking: System with banking terminal(s) attached.

#9012 Point of Sale: System with point of sale terminal(s) attached.

#9019 Other Industry Terminal System: Hospital systems or any other industry terminal systems.

Industrial Automation:

#9020 Electrical Test and Inspection: Monitoring or control of equipment that measures material or products to ensure conformance with specifications.

#9021 Process Control: Monitoring and control of production operations, primarily in the fluid and non-fluid process industries.

#9022 Laboratory Automation Systems: Includes instrument automation, experiment monitoring, and general laboratory automation.

#9023 Power Management - FC/PM: Power Management Systems which will use the Facilities Control/Power Management (FC/PM) licensed program.

#9024 Power Management - Non-FC/PM: Power management systems which will not use the FC/PM licensed program.

#9025 Facilities Management and Security: All other facilities management and security systems except Controlled Access System (CAS).

#9029 Other Industrial Automation: Controlled Access System (CAS), production monitoring, testing, and inspection (other than electronic test), discrete piece manufacturing, numerical tape control, materials handling, environmental monitoring, maritime, railroad, auto traffic control, air traffic control, simulators, other industrial automation.

Communications:

#9030 Concentrators/Multiplexers: Consolidation of input from terminals for transmission over high-speed lines to a remote computer.

#9031 Front End Processors - Large Systems.

#9032 Front End Processors - Small and Medium-Sized Systems.

#9033 Message Switching: Message routing and dispatching in a data communications network.

#9034 Telephone Switching: Switching (PABX Control), call routing, and central offices switching.

#9035 Audio Store and Forward.

#9039 Other Communications Applications: All other communications applications.

Scientific Computation:

#9050 Problem Solving: Engineering/Scientific Calculations. May be timesharing.

#9051 Instructional: Stand-alone or timeshared systems for computer-assisted instruction and related functions.

Business Data Processing:

#9070 Remote Job Entry: RJE or remote batch terminal.

#9071 Distributed Host Support - Data Entry: Single or clustered workstation terminal controller with limited peripherals and batch communication to a host. Primarily for dedicated intelligent data entry, but may be combined with remote job entry/batch functions.

#9072 Distributed Processing - Host Dependent: Combinations of terminal control, file management, communications, peripheral control, data entry, and local processing with heavy dependency on a host processor for continuous operation.

#9073 Distributed Business Processing: Stand-alone batch or interactive system for business applications in an enterprise with large systems. Offline communications to a host system is optional.

#9074 Business System: Same as #9073 but in new accounts or in enterprises with small or medium-sized systems only.

#9075 Business Problem Solving: Series/1 installed for the primary purpose of providing non-DP professional business problem solving support.

#9076 Office Automation: Series/1 installed primarily for text processing, electronic mail, audio distribution, etc., with or without some commercial applications.

#9079 Other Business Applications: All other business data processing applications.

Other Applications:

#9090 Applications not classified in any category above: For example, graphic arts (e.g., typesetting), design and drafting, undefined government, and any other.

Application Unknown:

#9095 Applications temporarily unknown: Specify within 15 days of order entry.

- Multiple Processors:

#92AA	Number of processors
#93BB	Sequence number

For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of this processor.

Note: Use the multiple processor specify codes given above to define the number of processors and the sequence numbers for each processor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl. For more than 16 processors in system, contact IBM.

4952 Processor (cont'd)

- Diskette IPL:
Mdl C:
#9138 1st diskette primary IPL, 2nd diskette not used
#9139 1st diskette alternate IPL, 2nd diskette not used
#9140 2nd diskette primary IPL, 1st diskette not used
#9141 2nd diskette alternate IPL, 1st diskette not used
#9142 1st diskette primary IPL, 2nd diskette alternate IPL
#9143 2nd diskette primary IPL, 1st diskette alternate IPL
#9144 No IPL
Mdl 30D:
#9148 Disk primary IPL, Optional diskette not IPL device
#9149 Disk alternate IPL, Optional diskette not IPL device
#9150 Diskette primary IPL, Disk not IPL device
#9151 Diskette alternate IPL, Disk not IPL device
#9152 Disk primary IPL, Diskette alternate
#9153 Diskette primary IPL, Disk alternate
#9144 No IPL
- Diskette Functions: When diskette function is included in a Series/1 configuration, IPL from such a device is required for loading diagnostics.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the "Specification Table" below. To simplify, shorten, and improve the usability of these pages, descriptions of all those features which are available on all processors, the 4959, and the 4965 are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for the 4959 Input/Output Expansion Unit, and 4965 Storage and I/O Expansion Unit required in the processor for a 4959 or 4965 connected to 4952 mdls A, B, C, and 30D. **Field Installation:** Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed to show status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Lines. Mounts under front cover of a mdl B or 30D Processor only. Does not require a feature position. **Limitations:** Cannot be installed on a mdl A or C Processor. **Field Installation:** Yes.

Diskette Drive (#4100): Provides for a second diskette on mdl C and a single diskette drive on the mdl 30D. Does not require a feature position. **Field Installation:** Yes.

Stand-Alone Enclosure (#4520): For the 4952 mdls C and 30D. Consists of a 3-sided wraparound cover with decorative, removable, front and rear covers. When connecting a mdl C or 30D to a 4965 both in the Stand-Alone Enclosure, specify Stand-Alone Enclosure Cable (#4525). **Limitations:** Features and devices that interconnect using flat or internal cabling are not supported in the Stand-Alone Enclosure. See Note 1 at the end of the "Specification Table". **Field Installation:** Yes.

Stand-Alone Enclosure Cable (#4525): Provides a 3.1 meter (10 foot) external shielded cable between a 4965 in a Stand-Alone Enclosure (#4520) and a 4952 also in a #4520. **Field Installation:** Yes. **Prerequisites:** #1565.

Programmer Console (#5650): [NO LONGER AVAILABLE] Provides data entry/data display console. Includes hexadecimal key pad, display lights, and ability to stop on error or on address. In addition to basic console provided with base processor. #5650 does not require a feature position. **Field Installation:** Yes. **Specify:** Nomenclature.

English US	#0150	Italian	#0132
French	#0128	Katakana	#0126
German	#0129	Spanish	#0131

Storage Addition Module - 32,768 Bytes (#6306): Provides additional processor main storage in 32,768-byte increments. Mounts on processor card. **Maximum:** Three. **Field Installation:** Yes.

Cache (#6400): Provides a means of reducing the effective access time of the disk, which can result in a substantial system level performance

improvement (mdl 30D). The cache option does not require a feature position. **Field Installation:** No.

Specification Table: The table below is provided to determine if 4959s or 4965s are required to mount the desired features. Available feature positions within the processor unit are model-dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirements numbers cannot exceed zero. **Note:** Storage Addition Modules mount on processor card and do not occupy any feature positions.

Notes:

- (1) Not supported on the Stand-Alone Enclosure due to flat or internal cabling.
- (2) Must be contiguous I/O feature positions.
- (3) Contact IBM when considering the use of this feature.
- (4) This feature may be placed in mdl B feature position A (leftmost). Other features may not be located in this position. Does not apply to mdls A, C, and 30D.
- (5) Must be contiguous I/O feature position with its associated controller.
- (6) This feature may be placed in mdl B feature position A (leftmost) if no system + and - 12 V DC power is required.
- (7) Supported in Stand-Alone Enclosure only with Stand-Alone Enclosure Cable (#4525).

MODEL CONVERSIONS (None)
ACCESSORIES

Customer Access Panel (#1590): Assembly and cables to provide interface at surface of rack with quick disconnect type connection for Integrated Digital Input/Output (#1560) or Customer Direct Program Control Adapter (#5430) features (up to four in any mix), plus one Timer (#7840) with external sources and one Teletypewriter Adapter (#7850). Connecting cables from panel for Timer and Teletypewriter Adapter are included. Cables for connected Integrated Digital Input/Output and Customer Direct Program Control Adapter are obtained separately. See #1593 and #1594 below. **Field Installation:** Yes. **Restrictions:** May not be mounted behind the following units: 4952A without EC375810, any mdl 30D or any unit in a Stand-Alone Enclosure (#4520).

Customer Access Panel - Integrated DI/DO Cable (#1593): Internal cable which connects Integrated Digital Input/Output (#1560) with Customer Access Panel (#1590). Provides both plug and receptacle at Customer Access Panel and connectors at Integrated Digital Input/Output feature. Up to a total of six #1593s and #1594s may be accommodated in each full-width machine. (Half-width machines are limited by available feature positions.)

Customer Access Panel - Customer DPC Adapter Cable (#1594): Internal cable which connects Customer Direct Program Control Adapter (#5430) with Customer Access Panel (#1590). Provides both plug and receptacle at Customer Access Panel and connectors at Customer Direct Program Control Adapter. Up to a total of six #1593s and #1594s may be accommodated in each full-width machine. (Half-width machines are limited by available feature positions.) **Field Installation:** Yes.

Frame Stand (P/N 6841365): Provides a steel stand capable of supporting a 4952 mdl C or 30D and a 4975 Printer. The stand rests on glides, and comes in a pebble gray color only.

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installation are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages.

SUPPLIES

Diskettes: The 4952 mdls C and 30D use the 1-sided Diskette 1 or the 2-sided Diskette 2 or Diskette 2D. The 4952 mdl C or 30D may be used to reformat the diskettes. Single diskettes are packaged 10 per box. Minimum order is one box.

4953 PROCESSOR

(The 4953 is no longer available ... certain features, RPQs, and accessories are still available.)

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A A00: 64K maximum, 4 I/O feature or storage locations, half-width unit. 16KB basic storage provided.

Model B B00: 64KB maximum, 13 I/O feature or storage locations, full-width unit. 16KB basic storage provided.

Model C C00: 64KB maximum, 4 I/O feature or storage locations, half-width unit. 32KB basic storage provided.

Model D D00: 64KB maximum, 13 I/O feature or storage locations, full-width unit. 32KB basic storage provided.

All models are designed for mounting in a 4997 or an EIA standard 19-inch rack enclosure.

Prerequisites: For model A or C space in Rack Mounting Fixture (#4540). See "Auxiliary Features" in M4959 pages.

HIGHLIGHTS

- Processor Unit in Series/1 family. Internal performance approximately 1.25 times that of 4952. Provides CPU, 16,384 bytes or 32,768 bytes of main storage, enclosure, and power. Includes storage address translation function (eight 64KB address spaces), and communications power. Three additional storage increments of 64KB each are pluggable on the storage card. Number of I/O feature locations is mdl-dependent. See "Specifications Table" at end of section. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart. Eight general purpose registers per level. Byte-addressable storage.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See "Customer Site Preparation Manual" (GA34-0050) for details.

Publications: "IBM Series/1 4953 Processor and Processor Features Description" (GA34-0022).

SPECIFY

- Power (AC, 1-phase): With a 1.8m (6 ft) cord.

50 HZ		60 HZ	
100V	#2804	100V	#2730
110V	#2805	115V	#9901
123.5V	#2811	208V	#9902
200V	#2806	230V	#9904
220V	#2813		
235V	#2814		

- Type of Distribution Channel: Specify only one.

#9001 - Sales to Third Party Participants (TPPs): Sales to systems integrators, programming houses, other

equipment manufacturers (OEMs), who, in turn, resell to end-users. Includes sales to business concerns who resell to their independent franchises or distributors.

#9002 - End-User Sales: Sales directly to the business concern which will use the system for the intended application.

- Primary Application: Specify only one.

Industry Terminal Systems:

#9010 - Plant Floor System: Collection or dissemination of data using plant floor terminals requiring human intervention. Time and attendance, job reporting, etc.

#9011 - Banking: System with banking terminal(s) attached.

#9012 - Point of Sale: System with point of sale terminal(s) attached.

#9019 - Other Industry Terminal System: Hospital systems or any other industry terminal systems.

Industrial Automation:

#9020 - Electrical Test and Inspection: Monitoring or control of equipment that measures material or products to ensure conformance with specifications.

#9021 - Process Control: Monitoring and control of production operations, primarily in the fluid and non-fluid process industries.

#9022 - Laboratory Automation Systems: Includes instrument automation, experiment monitoring, and general laboratory automation.

#9023 - Power Management - FC/PM: Power Management Systems which will use the Facilities Control/Power Management Program Product (FC/PM).

#9024 - Power Management - Non-FC/PM: Power Management Systems which will not use the FC/PM Program Product.

#9025 - Facilities Management and Security: All other facilities management and security systems (except Controlled Access System (CAS)).

#9029 - Other Industrial Automation: Controlled Access System (CAS), production monitoring, testing, and inspection (other than electronic test), discrete piece manufacturing, numerical control tape control, materials handling, environmental monitoring, maritime, railroad, auto traffic control, air traffic control, simulators, other industrial automation.

Communications:

#9030 - Concentrators/Multiplexers: Consolidation of input from terminals for transmission over high speed lines to a remote computer.

#9031 - Front-End Processors - Large Systems: Front end processors for large systems.

#9032 - Front-End Processors - Small Systems: Front end processors for small systems.

#9033 - Message Switching: Message routing and dispatching in a data communications network.

#9034 - Telephone Switching: Switching (PABX control), call routing, and central office switching.

#9035 - Audio Store and Forward.

#9039 - Other Communications Applications: All other communications applications.

Scientific Computation:

#9050 - Problem Solving: Engineering/Scientific Calculations. May be timesharing.

#9051 - Instructional: Stand-alone or time-shared systems for computer-assisted instruction and related functions.

Business Data Processing:

#9070 - Remote Job Entry: RJE or Remote Batch Terminal.

#9071 - Distributed Host Support - Data Entry: Single or clustered workstation terminal controller with limited peripherals and batch communication to a host. Primarily for dedicated intelligent data entry, but may be combined with remote Job Entry/Batch functions.

#9072 - Distributed Processing - Host Dependent: Combinations of terminal control, file management, communications, peripheral control, data entry, and local processing with heavy dependency on a host processor for continuous operation.

#9073 - Distributed Business Processing - Stand-alone, Large Account: Stand-alone batch or interactive system for business applications in an enterprise with large systems. Offline communications to a host system is optional.

#9074 - Business System - Small account: Same as #9073 but in enterprises with small systems as the largest system or in new accounts.

#9079 - Other Business Applications: All other business data processing applications.

Other Applications:

#9090 - Applications not classified in any category above: For example, graphic arts (typesetting, etc.), design and drafting, undefined government, and any other.

Application Unknown:

#9095 - Applications temporarily unknown: Specify within 15 days of order entry.

Multiple Processors:

#92AA - Number of Processors

#93BB - Sequence Number

For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of this processor.

Note: In ordering, for processors which are part of a multiprocessor system, use a suffix X as the low-order digit in the three-digit AAS mdl code. For example, in a 2-processor system using mdl B processors, the first will be B00 and the second will be B0X. Use the multiple processor specify codes given above to define the number of processors and the sequence number for each processor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl. For more than 16 processor systems, contact IBM.

Power Cord Codes:

(Canada only > #2744 <)
(Japan only > #2747 <)

Attachment of 3101:

#2787 - Designates that a 3101 Display Terminal is on order for this system and that its delivery is to be synchronized with that of the system.

Machine Nomenclature:

#2928 French	#2931 Spanish
#2929 German	

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the Specification Table below. To simplify, shorten and improve the usability of these pages, the description of all those features which are available in all processors, the 4965 Diskette Drive and I/O Expansion Unit and the 4959 Input/Output Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower #1565: Provides channel repower for 4959 Input/Output Expansion Unit. Required for 4959 or 4965 connected to 4953. Field Installation: Yes.

Communications Indicator Panel #2000: Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multi-line control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed showing status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Lines. Mounts under front cover of a mdl B or D Processor only. Does not require a feature position. Limitations: Cannot be installed on a mdl A or C processor. Field Installation: Yes.

Communications Power #2010: Provides + and - 12 volts regulated power. Required for mdl B or D containing one or more integrated communications features #1310, #1610, #2074, #2075, #2090, #2091, #2092, #2093, #2094, #2095, #2096 and #7881. Also required for Teletypewriter Adapter (#7850) configured for EIA voltage interface or for current loop where Series/1 supplies the power. Not required for a 4953 Processor mdl A or C. This feature is installed in the power supply section and does not occupy a feature position. Field Installation: Yes.

Programmer Console #5650: Provides data entry/data display console. Includes hexadecimal key pad and display lights, ability to stop on error or on address. In addition to Basic Console provided with base processor. Does not require a feature position.

Nomenclature:

#0150 English US	#0132 Italian
#0128 French	#0131 Spanish
#0129 German	

Field Installation: Yes.

Storage Addition - 16,384 Bytes (#6315): (NO LONGER AVAILABLE) Provides additional processor main storage in 16,384 byte increments. Requires one feature position. Maximum: Three in mdls A and B, two in mdls C and D. Field Installation: Yes.

Storage Addition - 32,768 Bytes (#6316): (NO LONGER AVAILABLE) (Mdls C, D) Provides additional processor main storage in 32,768 byte increments. Requires one feature position. Maximum: One. Field Installation: Yes.

Specification Table: The table below is provided to determine if 4965 Diskette drive and I/O Expansion Units or 4959 Input/Output Expansion Units are required to mount the desired features. Available feature positions within the processor unit are mdl dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable con-

MACHINES

figuration is that the sum of the availability and requirements numbers cannot exceed zero.

Notes:

1. This feature may be placed in 4953-B or 4953-D feature position A (leftmost). Other features may not be located in this position. Does not apply to 4953-A or 4953-C.
2. Requires #2010 to provide + and - 12 volts used in mdls B or D.
3. Requires #2010 (except in mdls A and C) to provide + and - 12 volts if the system is to provide power for the current loop or if the EIA voltage level compatibility option is selected.
4. This feature may be placed in 4953-B or 4953-D feature position A (leftmost) when the feature does not require + and - 12V DC.
5. Mdls C and D only.
6. Must be contiguous I/O feature positions.
7. Must be in contiguous I/O feature position with its associated controller.
8. Branch level systems assurance is required before ordering this feature.

MODEL CONVERSIONS (NONE)

ACCESSORIES

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages.

SUPPLIES (NONE)

4954 PROCESSOR

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A A00: (NO LONGER AVAILABLE) 256KB maximum, 4 I/O feature locations, half-width unit. Basic storage of 64KB provided.

Model B B00: (NO LONGER AVAILABLE) 256KB maximum, 13 I/O feature locations, full-width unit. Basic storage of 64KB provided.

Model C C00: (NO LONGER AVAILABLE) 256KB maximum, 3 I/O feature locations, full-width unit. Basic storage of 64KB and one built-in diskette drive provided. Second diskette drive optional.

Model 30D: (NO LONGER AVAILABLE) 256KB maximum, six I/O feature locations, full-width unit. Basic storage 64KB, with a 30MB disk, optional cache and optional 1.2MB diskette.

Model 60D: (NO LONGER AVAILABLE) 256KB maximum, six I/O feature locations, full-width unit, 64KB basic storage, with a 60MB disk, optional cache and optional 1.2MB diskette.

All models are designed for mounting on support rails in a 4997 Rack Enclosure (see M4997 pages) or in an EIA standard 19-inch enclosure. Models C, 30D, and 60D can also be mounted in the Stand-Alone Enclosure (#4520). Limitations: 4999 Battery Backup Unit may not be used with mdl C, 30D, and 60D. Mdl B is not supported by 4999 when primary power consumption exceeds 800 VA (corrected for power factor).

Prerequisites: For mdl A, a space in Rack Mounting Fixture (#4540). See "Auxiliary Features" in M4959 pages.

HIGHLIGHTS

- Processor unit in series/1 family.
- Internal performance approximately twice that of 4952.
- Provides CPU, 65,536 bytes of main storage, enclosure and power.
- Includes storage address translation function (eight 64KB address spaces), and communications power.
- Three additional storage increments of 64KB each are pluggable on the storage card.
- Number of I/O feature locations is mdl-dependent. See "Specifications Table" at end of section.
- Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart.
- Eight general purpose registers per level.
- Byte-addressable storage.
- Includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.
- Mdl C provides one or two diskette drives and three I/O feature positions. The diskettes, one standard and the second an optional feature, provide the multiple functions of diskette media including input of data and programs generated offline, as well as output of programs and data for personal or offline storage, journaling, recording of audit trail, checkpoints, system errors, etc. Data exchange media is compatible with

other systems using the diskette types and formats shown below.

Standard Features

Diskette Types: Either the 2-sided IBM Diskette 2, IBM Diskette 2D, or the 1-sided IBM Diskette 1 may be used.

Diskette Formats: Diskette Type 1 or 2 may be initialized for 128, 256, or 512 byte sectors. Diskette Type 2D may be initialized for 256, 512, or 1,024 byte sectors.

Diskette Capacity: Capacity of diskette is dependent upon type and format. Note: Actual useful capacity depends on the system software used and may be less than capacities shown here.

BYTES/ SECTOR	SECTORS/ TRACK*	DISKETTE TYPE	CAPACITY (BYTES)
128	26	1	246,272
256	15	1	284,160
512	8	1	303,104
128	26	2	492,544
256	15	2	568,320
512	8	2	606,208
256	26	2D	985,088
512	15	2D	1,136,640
1,024	8	2D	1,212,416

* 74 Data tracks per surface, Diskette-2 and 2D have two surfaces.

Diskette Drive: Access time includes 5 milliseconds per track crossed plus 35 milliseconds for head settling. Diskette rotates at 360 rpm, yielding a data rate of 62,500 bytes per second and average latency of 83.8 milliseconds. The use of Flexible Diskette Storage provides significant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage, etc. It should be recognized, however, that during recording and reading, the read/write head is in contact with the media causing diskette wear over time. Variations in the rate of wear will depend upon the particular operating environment and application characteristics. Care in the storage, use, and handling can also affect diskette life (see guidelines in the "IBM Diskette General Information Manual", GA21-9182). Excessive wear, handling, or contamination can cause possible failures in recording and/or reading. Ultimate wear is to some extent dependent upon total usage of individual tracks. Care taken to distribute data, so that accessing occurs over the entire recording surface with about the same frequency, can extend the useful life of the diskette. Actual experience with individual applications and environments will allow development of guidelines as to when the media should be replaced. Unpredictable circumstances, such as contamination or severe handling, can shorten useful life. For all the above reasons, consideration should be given to providing an adequate recovery plan.

Disk Drive MDLS 30D and 60D: Provides a capacity of 30 megabytes and 60 megabytes respectively per disk drive. Both mdls have an average access time of 35 milliseconds. Average rotational latency is 9.5 milliseconds. The disk rotates at 3,151 rpm yielding an instantaneous data rate of 1,250,000 bytes per second. A high level of data integrity is maintained by Error Checking and Correcting (ECC) which corrects any error of nine bits or less and any error of 16 bits or less within a 2-byte boundary. Also, ECC will detect up to two 2-byte errors within any 256-byte block.

Cache: The 64 kilobyte cache is microprocessor controlled and has the potential to significantly improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are pre-fetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improve-

ments are application-dependent -- test cases from a variety of applications thought to be typical have shown improvements in disk throughput ranging from 50 per cent to above 200 per cent. No guarantee of result can be made. Applications which are truly random (test cases found none) or which are heavily write-oriented may experience little or no improvement from a cache function.

Operating Environment: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile ambient conditions. See "Customer Site Preparation Manual", GA34-0050, for details.

240V #9914	230V #9904

- **Industrial Automation Systems Specify #9010 Plant Floor System:** Collection or dissemination of data using plant floor terminals requiring human intervention. (Time and attendance, job reporting, etc.)
- **Multiple Processors:** For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of this processor. Note: In WT AAS for processors which are part of a multiprocessor system, use a suffix X as the low-order digit in the three-digit WT AAS mdl code. For example, in a two-processor system using mdl B processors, the first will be B00 and the second will be B0X. Use the multiple processor specify codes given above to define the number of processors and the sequence number for each processor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl.

- **Diskette IPL:**

- Mdl C:

#9138 First Diskette Primary IPL, Second Diskette not used.
#9139 First Diskette Alternate IPL, Second Diskette not used.
#9140 Second Diskette Primary IPL, First Diskette not used.
#9141 Second Diskette Alternate IPL, First Diskette not used.
#9142 First Diskette Primary IPL, Second Diskette Alternate IPL.

#9143 Second Diskette Primary IPL, First Diskette Alternate IPL.
#9144 No IPL.

- Mdl 30D and 60D:

#9148 Disk primary IPL, Optional diskette not IPL device.
#9149 Disk alternate IPL, Optional diskette not IPL device.
#9150 Diskette primary IPL, Disk not IPL device.
#9151 Diskette alternate IPL, Disk not IPL device.
#9152 Disk primary IPL, Diskette alternate.
#9153 Diskette primary IPL, Disk alternate.
#9144 No IPL

- When diskette function is included in a Series/1 configuration, IPL from such a device is required for loading diagnostics.

- **Power Cord Codes:** #2744 for Canada, #2747 for Japan.
- **Attachment of 3101:** #2787 Designates that a 3101 Display Terminal is on order for this system and that its delivery is to be synchronized with that of the system.
- **Machine Nomenclature:**

Italian	#2932	Katakana	#2926
French	#2928	Spanish	#2931
German	#2929		

SPECIAL FEATURES

Feature sequence: All channel features that may use a feature position in this unit are presented in the "Specification Table" below. To simplify, shorten and improve the usability of these pages, the description of all those features which are available in all processors, the 4965 I/O Expansion Unit and the 4959 Input/Output Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are mdl-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for 4959 Input/Output Expansion Unit, and 4965 Storage I/O Expansion Unit. Required for 4959 and 4965 connected to 4954. Field Installation: Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed showing status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Lines. Mounts under front cover of a mdl B, 30D or 60D Processor only. Does not require a feature position. Limitations: Cannot be installed on a mdl A or C Processor. Field Installation: Yes.

Floating Point (#3925): Provides floating point instruction set. Includes single (32 bit) and double (64 bit) precision arithmetic plus conversion between binary and floating point data. Does not require a feature position. Maximum: One. Field Installation: Yes.

Series/1 To Personal Computer Channel Attachment Feature (#4000): Provides a Series/1 high speed channel-to-channel gateway to an IBM Personal Computer in a network environment. The Series/1 to PC channel attachment is a microprocessor controlled Series/1 feature card and a PC channel extender card (feature #4000). Series/1 to PC channel attachment cable provides a 20 ft. interconnect cable between the Series/1 and PC/PC-XT or PC-AT (feature #4001). Byte wide data transfer occurs at the maximum PC channel rate through the feature's shared data storage area. A

communication test diskette supplements the standard Series/1 diagnostics provided with this feature.

Service Information: Series/1 warranty and maintenance are applicable. Service for the Series/1 feature card (#4000) and PC cable interface (#4001) is available from the IBM Customer Engineering. Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O expansion units and 4954, 4955, and 4956 processors. Prerequisites: Series/1 to PC channel attachment cable, Series/1 (4954, 4955 and 4956 processors), an IBM Personal Computer System (PC/PC-XT/PC-AT) with a keyboard and monitor, and at least one diskette drive. Specify: Series/1 IPL Options: The PC can be designated as the primary, secondary, or non-IPL device.

Function/Description	Code
Primary IPL	#9501
Secondary IPL	#9502
Non-IPL Device (Default)	#9503

Publications: "IBM Series/1 to Personal Computer Channel Attachment Description Manual", (GA34-0287) --- "IBM Personal Computer - Series/1 to Personal Computer Channel Attachment Guide to Operations Kit", (SX34-0170) --- "IBM Personal Computer - Series/1 to Personal Computer Channel Attachment Hardware Maintenance and Service Kit", (SX34-0171).

Series/1 To Personal Computer Channel Attachment Cable (#4001): Provides interconnecting cable between the Series/1 feature card and the IBM Personal Computer channel extender card. The Series/1 to PC channel attachment cable is a 20 ft interconnect cable to connect the Series/1 feature card and the PC channel extender card (the Series/1 feature card and the PC channel extender card are both provided by feature code #4000). Series/1 to PC channel attachment cable is a shielded multi-twisted-pair cable and can be ordered in a 20 ft length only (feature #4001). Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O Expansion units and 4954, 4955 and 4956 processors. Prerequisites: Series/1 to PC channel attachment feature, Series/1 (4954, 4955 and 4956 processors), an IBM Personal Computer System (PC/PC-XT/PC-AT) with a keyboard and monitor, and at least one diskette drive.

Publications: "IBM Series/1 to Personal Computer Channel Attachment Description Manual", (GA34-0287).

Diskette Drive (#4100): Provides for a second diskette drive on the mdl C and a single diskette drive on the mdl 30D and 60D. Does not require a feature position. Field Installation: Yes.

Stand-Alone Enclosure (#4520): For the 4954 mdls C, 30D, and 60D. Consists of a 3-sided wraparound cover with decorative, removable, front and rear covers. When connecting a mdl C, 30D or 60D to a 4965 both in the Stand-Alone Enclosure, specify Stand-Alone Enclosure Cable (#4525). Limitations: Features and devices that interconnect using flat or internal cabling are not supported in the Stand-Alone Enclosure. See Note 3 at the end of the "Specification Table". Field Installation: Yes.

Stand-Alone Enclosure Cable (#4525): Provides a 3.1 meter (10 foot) external shielded cable between a 4965 in a Stand-Alone Enclosure (#4520) and a 4954 also in a (#4520). Field Installation: Yes. Prerequisites: #1565.

Programmer Console (#5655): Provides data entry/data display console. New function includes segmentation register display/store and console lock. Includes hexadecimal key pad and display lights, ability to stop on error or on address. In addition to Basic Console provided with base processor. Does not require a feature position. Field Installation: Yes.

● Nomenclature:

French	#0128	Katakana	#0126
German	#0129	Spanish	#0131
Italian	#0132		

Storage Addition Increment - 65,536 Bytes (#6307): (NO LONGER AVAILABLE) Provides additional processor main storage in 65,536 byte increments. Mounts on storage card. Maximum: Three. Field Installation: Yes.

Cache (#6400): Provides a means of reducing the effective access time of the disk, which can result in a substantial system level performance improvement (mdls 30D and 60D only). The cache option does not require a feature position. Field Installation: No

Specification Table: The table below is provided to determine if 4965 I/O Expansion Units or 4959 Input/Output Expansion Units are required to mount the desired features. Available feature positions within the processor unit are mdl dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirements numbers cannot exceed zero. All features (#1XXX through #7XXX) may be field installed.

Note: Storage Addition Increments mount on storage card and do not occupy any feature positions.

Notes:

1. Must be contiguous I/O feature positions.
2. Must be in contiguous I/O feature position with its associated controller.
3. Not supported in the Standalone Enclosure due to flat or internal cabling.
4. Branch level systems assurance is required before ordering this feature.
5. Supported in Stand-Alone Enclosure only with Stand-Alone Enclosure cable (#4525).

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages. WT AAS Ordering Instructions: The 4954 is a Computer System.

MODEL CONVERSIONS

Model Upgrade 30D to 60D: All conversions may be field installed. Any model upgrade that involves a disk storage capacity change requires replacement of the disk storage mechanism. Adequate provision must be made for retaining the data contained on the replaced disk mechanism and elimination of user proprietary information.

The upgrade purchase price for model conversion is greater than the purchase price differentials. The customer should carefully evaluate future requirements when purchasing a system.

Replaced parts from any model conversion that includes a disk storage capacity change become the property of IBM.

Model Downgrades: Conversion from model 60D to 30D is not recommended.

ACCESSORIES

Frame Stand (P/N 6841365): Provides an attractive, steel stand capable of supporting a 4954 mdl C, 30D or 60D (within a Stand-Alone Enclosure #4520) and a 4975 Printer. The stand rests on glides and comes in a pebble gray color only.

SUPPLIES

Diskettes: The 4954 mdls C, 30D or 60D use the 2-sided Diskette 2 or Diskette 2D or the 1-sided Diskette 1. Diskette 1 is prepared in 128, 256, or 512 bytes per sector. The Diskette 2 is prepared in 128, or 256 bytes per sector and must be re-initialized for other formats. The Diskette 2D is prepared in 256, 512, or 1,024 bytes per sector. The 4954 mdl C, 30D or 60D may be used to reformat the diskette. Single diskettes are packaged ten to a box. Minimum order is one box.

4955 PROCESSOR

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A A00: (NO LONGER AVAILABLE) 64KB maximum, eight I/O feature locations, full width unit. 16KB basic storage provided.

Model B B00: (NO LONGER AVAILABLE) 128KB maximum, three I/O feature locations, full width unit.

Model C C00: (NO LONGER AVAILABLE) 64KB maximum, ten I/O feature locations, full width unit. 32KB basic storage provided.

Model D D00: (NO LONGER AVAILABLE) 128KB maximum, seven I/O feature locations full width unit. 32KB basic storage provided.

Model E E00: (NO LONGER AVAILABLE) 256KB maximum, seven I/O feature locations, full width unit. Includes communications power (function similar to #2010) and storage address translation function (eight 64KB address spaces).

Model F F00: (NO LONGER AVAILABLE) 512KB maximum, seven I/O feature locations, full width unit. Includes communications power (function similar to #2010) and storage address translation function (eight 64KB address spaces).

All models are designed for mounting on support rails in a 4997 (see M4997 pages) or in an EIA standard 19-inch enclosure.

Limitations: Model E and model F are not supported by the 4999 Battery Backup Unit where primary power consumption exceeds 800VA (corrected for power factor). Contact IBM for further information.

HIGHLIGHTS

- Processor Unit in Series/1 family.
- Internal performance approximately 3.0 to 3.5 times that of 4952.
- Provides CPU, up to 524,288 bytes of main 955.2 storage, enclosure, and power.
- Number of feature locations is mdl dependent.
- See Specifications Table at end of section.
- Standard features include rich instruction set, four interrupt levels, storage protect, power failure detect/auto restart.
- Eight general purpose registers per level.
- Byte addressable storage.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These contaminants may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See "Customer Site Preparation Manual" (GA34-0050) for details.

Publications: "IBM Series/1 4955 Processor and Processor Features Description" (GA34-0021)

SPECIFY

Specify codes, #0XXX, #2XXX, 8XXX, and 9XXX, apply to plant orders only. Do not use on MES orders.

German	#2929	Spanish	#2931
Italian	#2932		

- Power Cord: #2744 for Canada, #2747 for Japan.
- Attachment of 3101: #2787 designates that a 3101 Display Terminal is on order for this system and that its delivery is to be synchronized with that of the system.
- Type of Distribution Channel: (Specify only one)

#9001 - Sales to Third Party Participants (TPPs): Sales to systems integrators, programming houses, other equipment manufacturers (OEMs), who, in turn, resell to end-users. Includes sales to business sales to business concerns who resell to their independent franchises or distributors.

#9002 - End-user Sales: Sales directly to the business concern which will use the system for the intended application.

- Primary Application: (Specify only one)

Industry Terminal Systems

#9010 - Plant Floor System: Collection or dissemination of data using plant floor terminals requiring human intervention. Time and attendance, job reporting, etc.

#9011 - Banking: System with banking terminal (s) attached.

#9012 - Point of Sale: System with point of sale terminal(s) attached.

#9019 - Other Industry Terminal System: Hospital systems or any other any industry terminal systems.

Industrial Automation

#9020 - Electrical Test and Inspection: Monitoring or control of equipment that measures material or products to ensure conformance with specifications.

#9021 - Process Control: Monitoring and control of production operations, primarily in the fluid and non-fluid process industries.

#9022 - Laboratory Automation Systems: Includes instrument automation, experiment monitoring, and general laboratory automation.

#9024 - Power Management-Non-FC/PM: Power Management Systems which will not; use the FC/PM licensed program.

#9025 - Facilities Management and Security: All other facilities management and security systems (except Controlled Access System (CAS)).

#9029 - Other Industrial Automation: Controlled Access System (CAS) production monitoring, testing, and inspection (other electronic test), discrete piece manufac-

turing numerical control tape control, materials handling, environmental monitoring, maritime, railroad, auto traffic control, air traffic control, simulators.

Communications

#9030 - Concentrators/Multiplexers: Consolidation of input from terminals for transmission over high-speed lines to a remote computer.

#9031 - Front End Processors-Large systems.

#9032 - Front End Processors-Small and medium-sized systems.

#9033 - Message Switching: Message routing and dispatching in a data communications network.

#9034 - Telephone Switching: Switching (PABX Control), call routing, and central office switching.

#9035 - Audio Store and Forward.

#9039 - Other Communications Applications: All other communications applications.

Scientific Computation

#9050 - Problem Solving: Engineering /Scientific Calculations. May be timesharing.

#9051 - Instructional: Stand-alone or timeshared systems for computer-assisted instruction and related functions.

Business Data Processing

#9070 - Remote Job Entry: RJE or Remote Batch control.

#9071 - Distributed Host Support-Data Entry: Single or clustered workstation terminal controller with limited peripherals and batch communication to a host. Primarily for dedicated intelligent data entry, but may be combined with remote job entry /batch functions.

#9072 - Distributed Processing - Host Dependent: Combinations of terminal control, file management, communications peripheral control, data entry, and local processing with heavy dependency on a host processor for continuous operation.

#9073 - Distributed Business Processing-Stand-alone, Large Account: Stand-alone batch or interactive system for interactive business applications in an enterprise with large systems. Offline communications to a host system optional.

#9074 - Business System - Small account: Same as #9073 but in new accounts or in enterprises with small or medium-sized systems only.

#9075 - Business Problem Solving: Series/1 installed for the primary purpose of providing non-DP professional business problem solving support.

#9076 - Office Automation: Series/1 installed primarily for text processing, electronic mail, audio distribution, etc., with or without some commercial applications.

#9079 - Other Business Applications: All other business data processing applications.

Other Applications

#9090 - Applications not classified in any category above: For example, graphic arts (typesetting, etc.), design and drafting, undefined government, and any other.

Application Unknown

#9095 - Applications temporarily unknown: Specify within 15 days of order entry.

- Multiple Processors: For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of processor.

Note: In WTAAS, for processors which are part of a multiprocessor system, use a suffix X as the low-order digit in the 3-digit WTAAS mdl code. For example, in a 2-processor system using mdl B processors, the first will be B00 and the second will be B0X. Use the multiple processor specify codes given above to define the number of processors and the sequence numbers for each processor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl. For complex multiple processor systems, contact IBM for more information.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the Specification Table below. To simplify, shorten and improve the usability of these pages, the descriptions of all those features which are available in all processors, the 4965 Storage and I/O Expansion Unit and the 4959 I/O Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are mdl-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for a 4959 I/O Expansion Unit, and 4965 Storage and I/O Expansion Unit. Required in the processor for a 4959 or 4965 connected processor for a 4959 or 4965 connected to 4955, all models. Field Installation: Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed to show status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data lines. Mounts under front cover of 4955. Does not require a feature position. Field Installation: Yes

Communications Power (#2010): (NO LONGER AVAILABLE) Not required for Models E or F. Provides +/-12 volts regulated power. Required for a processor containing one or more communications features #1310, #1610, #2074, #2075, #2090, #2091, #2092, #2093, #2094, #2095, #2096 and #7881. Also required for Teletypewriter Adapter (#7850) configured for EIA voltage interface or for current loop where Series/1 supplies the power, and for #2080 when V.35 interface is used. This feature is installed in the power supply section and does not occupy a feature position. Field Installation: Yes.

Floating Point (#3920): (NO LONGER AVAILABLE) Provides floating point instruction set. Includes single (32-bit) and double (64-bit) precision arithmetic plus conversion between binary arithmetic plus conversion between binary and floating point data. Prerequisites: I/O feature position adjacent to processor cards. Maximum: One. Field Installation: Yes.

Series/1 To Personal Computer Channel Attachment Feature (#4000): Provides a Series/1 high speed channel-to-channel gateway to an IBM Personal Computer in a network environment. The Series/1 to PC channel attachment is a microprocessor controlled Series/1 feature card and a PC channel extender card (feature #4000). Series/1 to PC channel attachment cable provides a 20 ft interconnect cable between the Series/1 and PC/P C-XT or PC-AT (feature #4001). Byte wide data transfer occurs at the maximum PC channel rate through the feature's shared data storage area. A communication test diskette supplements the standard Series/1 diagnostics provided with this feature. Series/1 warranty and maintenance are applicable. Service for the Series/1 feature card (#4000) and PC cable interface (#4001) is available from the IBM Customer Engineering. Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O expansion units and 4954, I/O expansion units and 4954, 4955 and 4956 processors. Prerequisites: Series/1 to PC channel attachment cable, Series/1 (4954, 4955 and

4956 processors), and IBM Personal Computer System (PC/PC-XT/PC-AT) with a keyboard and monitor, and at least one diskette drive. Specify: Series/1 IPL Options: The PC can be IPL Options: The PC can be designed as the primary, secondary, or non-IPL device.

Function/Description	Code
Primary IPL	#9501
Secondary IPL	#9502
Non-IPL Device (Default)	#9503

Series/1 To Personal Computer Channel Attachment Cable (#4001): Provides interconnecting cable between the Series/1 feature card and the IBM Personal Computer channel extender card. Personal Computer channel extender card. The Series/1 to PC channel attachment cable is a 20 ft interconnect cable to connect the Series/1 feature card and the PC channel extender card (the Series/1 feature card and the PC channel extender card are and the PC channel extender card are both provided by feature code #4000). Series/1 to PC channel attachment cable is a shielded multi-twisted-pair cable and can be ordered in a 20 ft length only (feature #4001). Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O Expansion units and 4954, Expansion units and 4954, 4955 and 4956 processors. Prerequisites: Series/1 to PC channel attachment feature, Series/1 (4954, 4955 and 4956 processors), and IBM Personal processors), an IBM Personal Computer System (PC/PC-XT/PC-AT) with a keyboard and monitor, and at least on diskette drive.

Publications: "IBM Series/1 to Personal Computer Channel Attachment Description Manual" (GA34-0287)

Programmer Console (#5650): (NO LONGER AVAILABLE) Provides data entry/data display console. Includes hexadecimal key pad and display lights, ability to stop on lights, ability to stop on error or on address. In addition to Basic Console provided with base processor. Does not require a feature position. Field Installation: Yes.

SPECIFY

• Nomenclature:

English US	#0150	Japanese	
French	#0128	Katakana	#0126
German	#0129	Spanish	#0131
Italian	#0132		

Storage Addition - 16,384 BYTES (#6325): Provides additional processor main storage in 16,384 byte increments. Mounts in storage addition position. Maximum: Three in mdl A, seven in mdl B. May be used as last storage card in mdls C and D. Field Installation: Yes.

Storage Addition - 32,768 BYTES (#6326): (Mdls C, D, and E) Provides additional processor main storage in 32,768 byte increments. Mounts storage addition position. Maximum: One in mdl C, three in mdl D. May be used as last storage card in mdl E. Field Installation: Yes.

Storage Addition - 65,536 BYTES (#6327): (Mdl E) Provides additional processor main storage in 65,536 byte increments. Mounts in storage addition position. Maximum: Three. Field Installation: Yes.

Storage Addition - 131,072 BYTES (#6328): (Mdl F) Provides additional processor main storage in 131,072 byte increments. Mounts

in storage addition position. Maximum: Three. Field Installation: Yes.

Storage Address Relocation Translator (#6335): (Mdls B, D) Provides capability to address up to 131,072 bytes. Required for storage sizes greater than 65,536 bytes. Does not require greater than 65,536 bytes. Does not require I/O feature position. Not required in mdl E or F. Field Installation: Yes.

Specification Table: The table below is provided to determine if the 4965 Storage and I/O Expansion Units or the 4959 Input/Output Expansion Units are required to mount the desired features. Units are required to mount the desired features. Available feature positions within the processor unit are mdl dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirements numbers cannot exceed zero.

Notes:

1. This feature may be placed in 4955 feature position A (left-most). Other features may not be located in this position.
2. Requires feature #2010 to provide +/-12 volts when used in mdls A, B, C, or D.
3. Requires I/O feature position immediately adjacent to processor cards.
4. Requires feature #2010 (except in mdl E or F) to provide +/-12 volts if the system is to provide power for the current loop or if the EIA voltage compatibility option is selected.
5. Must be contiguous I/O feature positions.
6. Must be in contiguous I/O feature position with its associated controller.
7. Contact IBM when considering the use of this feature.
8. Requires feature #2010 if the CCITT V.35 interface is used (except in models E or F).

MODEL CONVERSIONS (NONE)

ACCESSORIES

Auxiliary Features/ Cable/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages.

SUPPLIES (NONE)

4956 PROCESSOR

THERE IS MORE THAN 1 TEXT VERSION FOR THIS DOCUMENT

PURPOSE

Provides arithmetic, logic and control functions for Series/1.

MODELS

Model B10 B10: 1,024KB maximum, 13 I/O feature locations, full-width unit. 1MB basic storage provided.

Model E10 E10: 2,048KB maximum, 13 I/O feature locations, full-width unit. 1MB basic storage provided.

Model 31D 31D: 1,024KB maximum, six I/O feature locations, full-width unit. 1MB basic storage with a 30MB disk, optional cache and an optional 1.2MB diskette. (Field upgrade only - from Model 30D.)

Model 61D 61D: 1,024KB maximum, six I/O feature locations, full-width unit. 1MB basic storage with a 60MB disk, optional cache and an optional 1.2MB diskette.

Model E70 E70: 2,048KB maximum, six I/O feature locations, full-width unit. 1MB basic storage provided, 60MB integrated disk and optional cache and an optional 1.2MB diskette.

Model B00 B00: (NO LONGER AVAILABLE - REPLACED BY MODEL B10) 1,024KB maximum, 13 I/O feature locations, full-width unit. 256KB basic storage provided.

Model E00 E00: (NO LONGER AVAILABLE - REPLACED BY MODEL E10) 2,048KB maximum, 13 I/O feature locations, full-width unit. 512KB basic storage provided.

Model 30D 30D: (NO LONGER AVAILABLE) 1,024KB maximum, six I/O feature locations, full-width unit. 256KB basic storage with a 30MB disk, optional cache and an optional 1.2MB diskette.

Model 60D 60D: (NO LONGER AVAILABLE - REPLACED BY MODEL 61D) 1,024KB maximum, six I/O feature locations, full-width unit. 256KB basic storage with a 60MB disk, optional cache and an optional 1.2MB diskette.

Model E60 E60: (NO LONGER AVAILABLE - REPLACED BY MODEL E70) 2,048KB maximum, six I/O feature locations, full-width unit. 512KB basic storage provided, 60MB integrated disk and an optional 1.2MB diskette.

Model G G10: 1,024KB maximum, six I/O feature locations, full width unit, 40MB integrated disk (5-1/4 inch) with 400KB cache and a 1.2MB diskette (5-1/4 inch). 1MB basic storage provided. See M4956 Models G10 and H10 description later in document.

Model H H10: 2,048KB maximum, six I/O feature locations, full width unit, 1MB basic storage provided, 40MB integrated disk (5-1/4 inch), with 400KB cache and a 1.2MB diskette (5-1/4 inch). See M4956 Models G10 and H10 description later in document.

Model J J00: 2MB maximum, seven I/O feature locations, full width unit, 2MB basic storage provided, 40MB integrated disk (5-1/4 inch), with 400KB Cache and a 1.2MB Diskette (5-1/4 inch). See M4956 Models G10, H10 and J00 description later in document.

Model K K00: 14MB maximum. 14 I/O Feature locations, full width unit. 2MB basic storage and floating point provided.

All models are designed for mounting on support rails in a 4997 (see M4997 pages) or in an EIA standard 19-inch enclosure. Models 30D, 31D, 60D, 61D, E60 and E70 can also be mounted in the stand-alone enclosure (#4520).

Notes:

- Orders entered via WTAAS will use the three-digit code B00, B0X, C00, C0X, E00, E0X, 30D, 30X, 60D, 60X, E60, E6X, B10, B1X, C10, C1X, 31D, 31X, 61D, 61X, E70, E7X, K00 and K0X.
- Channel repower (#1565) must be ordered when a 4959 I/O expansion unit or 4965 storage and I/O expansion unit is attached to a 4956 Processor (all models).

HIGHLIGHTS

Models B10, 31D, and 61D: Processor unit in Series/1 family. Internal performance is approximately twice that of the 4954. Provides CPU, 1,024K bytes of error checking and correcting (ECC) corrects all single-bit errors and detects double-bit errors, thus providing improved availability compared to a processor using parity checking. Includes storage address translation function (eight 64KB address spaces) and communication power. See the table at the end of this section. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart and eight general purpose registers per level. Byte-addressable storage. Includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Model E10: Processor unit in IBM Series/1 Family. Internal performance is approximately 50% greater than that of the 4956 Model B10. Basic model provides CPU, 1,024K bytes of error checking and correcting main storage, enclosure and power. Error Checking and Correction (ECC) corrects all single bit errors and detects double bit errors, thus providing improved availability compared to a processor using parity checking. Includes storage address translation function (sixteen 64KB address spaces, eight 64KB I/O address spaces) and communication power. Additional 256KB, 512KB, and 1MB storage increments are allowed to a 2MB maximum. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart. Eight general purpose registers per level. Byte addressable storage, includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Model E70: 4956 Model E70 is an integrated package for the 4956 processor. This package offers a 60MB integrated disk, an optional 1.2 megabyte diskette, and an optional 64 kilobyte microprocessor controlled cache for the disk. Any attachment card or feature that can be plugged into the 4956 processor can be plugged into the new Model E70. The system contains a new processor that is 50% faster than the 4956 Model 31D and 61D. Maximum storage is 2MB (1MB directly addressable and 1MB secondary) which is twice that of the 4956 Models 31D and 61D.

Model K00: Processor unit in IBM Series/1 family. Internal performance is approximately 1 MIP*. Basic model provides 2MB of error checking and correcting (ECC) storage, high speed floating point, enclosure, 14 I/O feature locations, and power supply. Maximum storage is 14MB.

* The internal capability of the 4956 Processor models J00 and K00 to perform at 1MIP is application dependent; actual throughput of the processor may be less.

Diskettes:

- Diskette Types: (Models 31D, 61D, E70) Either the 2-sided Diskette 2, Diskette 2D, or the 1-sided Diskette 1 may be used (8 inch diskettes).

MACHINES

- **Diskette Formats:** Diskette Type 1 or 2 may be initialized for 128-, 256-, or 512-byte sectors. Diskette Type 2D may be initialized for 256-, 512-, or 1,024-byte sectors.
- **Diskette Capacity:** Capacity of diskette is dependent upon type and format.

Note: Actual useful capacity depends on the system software used and may be less than capacities shown here.

BYTES/ SECTOR	SECTORS/ TRACK*	DISKETTE TYPE	CAPACITY (BYTES)
128	26	1	246,272
256	15	1	284,160
512	8	1	303,104
128	26	2	492,544
256	15	2	568,320
512	8	2	606,208
256	26	2D	985,088
512	15	2D	1,136,640
1,024	8	2D	1,212,416

* 74 Data tracks per surface. Diskette 2 and 2D have two surfaces.

Diskette Drive: Access time includes 5 milliseconds per track crossed plus 35 milliseconds for head setting. Diskette rotates at 360 rpm, yielding a data rate of 62,500 bytes per second and average latency of 83.8 milliseconds. The use of Flexible Diskette Storage provides significant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage, etc. It should be recognized, however, that during recording and reading, the read/write head is in contact with the media causing diskette wear over time. Variations in the rate of wear will depend upon the particular operating environment and application characteristics. Care in storage, use and handling can also affect diskette life. See guidelines in "IBM Diskette General Information Manual", GA21-9182. Excessive wear, handling, or contamination can cause possible failures in recording usage of individual tracks. Care taken to distribute data, so that accessing occurs over the entire recording surface with about the same frequency, can extend the useful life of the diskette. Actual experience with individual applications and environments will allow development of guidelines as to when the media should be replaced. Unpredictable circumstances, such as contamination or severe handling, can shorten useful life. For all the above reasons, consideration should be given to providing an adequate recovery plan.

Disk Drive Models 30D, 31D, 60D, 61D, 60E and E70: Provide a capacity of 30 megabytes for Model 30D and 60 megabytes for Models 60D and 60E. All models have an average access time of 35 milliseconds.

Average rotational latency is 9.5 milliseconds. The disk rotates at 3,151 rpm yielding an instantaneous data rate of 1,250,000 bytes per second. A high level of data integrity is maintained by Error Checking and Correcting (ECC) which corrects any error of nine bits or less and any error of 16 bits or less within a 2-byte boundary. Also, ECC will detect up to two 2-byte errors within any 256-byte block.

Cache Model 30D, 31D, 60D, 61D, E60 and E70: The 64-kilobyte cache is microprocessor controlled and has the potential to significantly improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are pre-fetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improvements are application-dependent -- test cases from a variety of applications thought to be typical have shown improvements in disk throughput ranging from 50% to above 200%. No guarantee of results can be made. Applications which are truly random (test cases found none) or which are heavily write-oriented may experience little or no improvement from a cache function.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See Customer Site Preparation Manual (GA34-0050) for details.

SPECIFY

MES Model Upgrades

#9510: Basic Storage 256KB ONLY - Use this Specify Code for MES Model Upgrades when only basic 256KB storage is required and no additional storage is wanted. This applies to Model Upgrades from 4956 Model B00, B0X, 30D, 30X, 60D, 60X to 4956 Model E00, E0X, E60 or E6X.

#9515: Multiple 256KB Basic Storage Cards - Use this Specify Code for MES Model Upgrades when one 256KB storage card and one or more additional 256KB storage cards are required. There are no 512KB storage cards in the processor and none are required. This Specify Code applies to Model Upgrades from 4956 Model B00, B0X, 30D, 30X, 60D or 60X to 4956 Model E00, E0X, E60 or E6X.

Note: These Specify Codes are mandatory at order entry time if no 512KB storage cards are present or required on the upgraded models.

Unless otherwise indicated, these specify features are only available at time of manufacture. Specify codes (#2XXX, #8XXX and #9XXX) apply to plant orders only. Do not use on MES orders unless otherwise specified.

- **Power (AC, 1-phase):** With 1.6m (6 ft) cord.

50Hz	60Hz

French #2928	Japanese

Katakana #2926

Multiple Processors:

- #92AA Number of Processors
- #93BB Sequence Number

For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of this processor.

Note: In WTAAS, for processors which are part of a multi-processor system, use a suffix X as the low-order digit in the three digit WTAAS model code. For example, in a two-processor system using Model B processors, the first will be B00 and the second will be B0X. Use the multiple processor specify codes given above to define the number of processors and the sequence number for each processor in a multiprocessor system. Processors in a multiprocessor system need not be the same type or model. For complex multiple processor systems, contact the International Support Center in Boca Raton.

Diskette IPL:

Model C and C10

- #9138: First diskette primary IPL, optional diskette not IPL device.
- #9139: First diskette alternate IPL, optional diskette not IPL device.
- #9140: Second diskette primary IPL, optional diskette not IPL device.
- #9141: Second diskette alternate IPL, optional diskette not IPL device.
- #9142: First diskette primary IPL, second diskette alternate.
- #9143: Second diskette primary IPL, first diskette alternate.
- #9144: No IPL.

Model 30D, 31D, 60D, 61D, 60E and E70:

- #9148: Disk primary IPL, optional diskette not IPL device.
- #9149: Disk alternate IPL, optional diskette not IPL device.
- #9150: Diskette primary IPL, disk not IPL device.
- #9151: Diskette alternate IPL, disk not IPL device.
- #9152: Disk primary IPL, diskette alternate.
- #9153: Diskette primary IPL, disk alternate.
- #9144: No IPL.

When diskette function is included in a Series/1 configuration, IPL from such a device is required for loading diagnostics.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the table at the end of this section. To simplify, shorten and improve the usability of these pages, the description of all those features which are available in all processors, the 4965 storage and I/O expansion unit and the 4959 Input/Output Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for 4959 Input/Output Expansion Unit, and 4965 Storage and I/O Expansion Unit. Required for 4959 or 4965 connected to 4956 Models B00, B10, C00, C10, E00, E10, 30D, 31D, 60D, 61D, E60, E70 and K00. Field Installation: Yes.

Communication Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel.

Eight lights are used for the display. Coded information is displayed showing status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Line. Mounts under front cover of the processor. Does not require a feature position. Limitation: Cannot be installed on a Model C Processor.

Floating Point (#3925): Provides floating point instruction set for 4956 Models B00, B10, C00, C10, 30D, 31D, 60D and 61D. Includes single (32-bit) and double (64-bit) precision arithmetic plus conversion between binary and floating point data. Does not require a feature position. Maximum: One. Field Installation: Yes.

Floating Point (#3926): Provides floating point instruction set for 4956 Models E00, E10, E60 and E70 only. Includes single (32-bit) and double (64-bit) precision arithmetic plus conversion between binary and floating point data. Does not require feature position. Maximum: One. Field Installation: Yes.

Series/1 to Personal Computer Channel Attachment Feature (#4000): Provides a Series/1 high speed channel to channel gateway to an IBM Personal Computer in a network environment.

Highlights:

The Series/1 to PC channel attachment is a microprocessor controlled Series/1 feature card and a PC channel extender card* (feature #4000). Series/1 to PC channel attachment cable (Feature #4001) provides a 20' interconnect cable between the Series/1 and PC/PC XT or PC AT. Byte wide data transfer occurs at the maximum PC channel rate through the feature's shared data storage area. A communication test diskette supplements the standard Series/1 diagnostics provided with this feature.

Service Information:

Series/1 warranty and maintenance are applicable. Service for the Series/1 feature card (#4000)* and PC cable interface (#4001) is available from the IBM National Service Division. Note: "A Personal Computer Channel Extender Card is included in the #4000 ship group. Terms and conditions for installation, warranty and maintenance are the same as the Personal Computer in which the PC Channel Extender Card is installed. There is no incremental Personal Computer maintenance charge for the Personal Computer Channel Extender Card when installed in an IBM Personal Computer.

Publications:

- "IBM Series/1 to Personal Computer Channel Attachment Description Manual" (GA34-0287)
- "IBM Personal Computer - Series/1 to Personal Computer Channel Attachment Guide to Operations Kit" (SX34-0170)
- "IBM Personal Computer - Series/1 to Personal Computer Channel Attachment Hardware Maintenance and Service Kit" (SX34-0171)

Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O expansion units and 4954, 4955 and 4956 processors. Prerequisites: Series/1 to PC channel interconnect cable, Series/1 (4954, 4955 and 4956 processors), an IBM Personal Computer System (PC, PC XT, PC AT) with a keyboard and monitor, and at least one 5-1/4 inch 360KB diskette drive. Specify: Series/1 IPL Options: The PC can be designed as the primary or secondary or non-IPL device.

Function/Description	Code
Primary IPL	#9501
Secondary IPL	#9502
Non-IPL Device (Default)	#9503

French #0928	Spanish #0931

Series/1 to Personal Computer Channel Attachment Cable (#4001): Provides interconnecting cable between the Series/1 feature card and the IBM Personal Computer channel extender card.

MACHINES

Highlights:

The Series/1 to PC channel attachment cable is a 20 foot interconnect cable to connect the Series/1 feature card and the PC channel extender card (the Series/1 feature card and the PC channel extender card are both provided by feature code #4000). Series/1 to PC channel attachment cable is a shielded multi-twisted pair cable and can be ordered in a 20 foot length only (feature #4001).

Publications: "IBM Series/1 to Personal Computer Channel Attachment Description Manual" (GA34-2087).

Field Installation: Yes. Limitations: Available only on the 4959, 4965 I/O Expansion units and 4954, 4955 and 4956 processors. Prerequisites: Series/1 to PC channel attachment feature, Series/1 (4954, 4955 and 4956 processors), an IBM Personal Computer System (PC, PC XT, PC AT) with a keyboard and monitor, and at least one 5-1/4 inch 360KB diskette drive.

Diskette Drive (#4100): Provides for a second diskette drive on the Model C and a single diskette drive on the Model 30D, 31D, 60D, 61D, E60 and E70. Does not require a feature position. Field Installation: Yes.

Stand-Alone Enclosure (#4520): For the 4956 Models C, C10, 30D, 31D, 60D, 61D, E60 and E70. Consists of a three-sided wraparound cover with decorative, removable front and rear covers. When connecting a Model C00, C10, 30D, 31D, 60D, 61D, E60 and E70 to a 4965 both in the Stand-Alone Enclosure, specify Stand-Alone Enclosure Cable (#4525). Limitations: Features and devices that interconnect using flat or internal cabling are not supported in the Stand-Alone Enclosure. See Note 3 at the end of the "Specification Table." Field Installation: Yes.

Stand-Alone Enclosure Cable (#4525): Provides a 3.1m (10 ft) external shielded cable between a 4965 in a Stand-Alone Enclosure (#4520) and a 4956 also in a (#4520). Field Installation: Yes. Prerequisites: Yes, #4520.

Programmer Console (#5655): Provides data entry/data display console. Added function includes display/store into I/O segmentation registers and console lock. Includes hexadecimal key pad and display lights, ability to stop on error or on address. In addition to Basic Console provided with base processor. Does not require a feature position. Field Installation: Yes.

Nomenclature:

English US	#0150	Italian	#0132
German	#0129	Spanish	#0121
French	#0128	Japanese	
		Katakana	#0126

Storage Addition Card - 256KB Bytes (#6330): Provides additional processor main storage in 262,144 byte increments. Requires one feature position. Maximum: Three in Models B, B10, 30D, 31D, 60D and 61D; three in Models B and 60D upgraded to Models E and 60E;

and two in Model C. (See allowable storage combinations, below.) Field Installation: Yes.

Storage Addition Card - 512KB (#6331): Provides additional processor main storage in 524,288-byte increments. Requires one feature position. Limitations: Total processor main storage in Models B00, B10, C00, C10, 30D, 31D, 60D and 61D cannot exceed 1024KB. Model E and 60E cannot exceed 2048KB. (See allowable storage combinations, below.)

Basic Storage Upgrade to 512KB (#6332): (NO LONGER AVAILABLE) Provides 524,288 bytes of processor main storage instead of 262,144 bytes (Models B00, B10, C00, C10, 30D, 31D, 60D and 61D only). Does not require a feature position. Limitations: Total processor storage cannot exceed 1024KB. Field Installation: No.

Basic Storage Upgrade to 512KB (RPQ D02793): (NO LONGER AVAILABLE) Provides 524,288 bytes of processor main storage (Model E and 60E only). This is a field Basic Storage Upgrade of 4956 Model B to Model E or 4956 Model 30D or 60D to 60E that contains only 256KB storage cards and a 512KB storage is required. RPQ D02793 when installed must be in feature position #1.

Note: Total processor main storage in Models E00, E10, E60 and E70 cannot exceed 2048KB bytes. Maximum: See allowable combinations below. Field Installation: Yes.

Storage Addition Card - 1MB (#6334): Provides additional processor main storage in one 1,048,576-byte increment for Models E10 and E70 only. Requires one feature position. Limitations: Total processor main storage in Models E10 and E70 cannot exceed 2,048KB (two 1MB cards). Field/Factory Installation: Yes.

Storage Addition Card - 2Mb (#6340): Provides additional processor main storage in one 2048Kb increment for Model K00 only.

Storage Addition Card - 4Mb (#6341): Provides additional processor main storage in one 4096 increment for Model K00 only.

Orders for additional storage card features #6340 and #6341 must include a Specify Code to reflect the correct storage card quantity that will be installed as a result of the order. A specify code is required so that the proper set of cross-over connectors will be supplied with the order. Only one specify code is required for the installation or removal of storage card features #6340 or #6341. Orders with multiple specify codes will be rejected. Remove/Re-install RPQs are available. The correct set of storage card connectors will be sent with the RPQ instructions. It is necessary to know what ultimate configuration is required. The correct specify code will cause the correct set of connectors to be delivered. When a card is removed a specify code must also be removed and a new specify code assigned if a feature card(s) remains. Branch Administration should remove the specify code prior to adding the new specify code when storage card features are added or removed. Factory orders for processors that contain no additional storage features do not require a specify code.

Config. Number	Additional Storage	Required Specify Code	Total Additional Storage (MB)
1	None	None	0
2	6340(Qty 1)	9511	2
3	6340(Qty 2)	9512	4
4	6340(Qty 3)	9513	6
5	6340(Qty 1) 6341(Qty 1)	9512	6
6	6340(Qty 2) 6341(Qty 1)	9513	8
7	6340(Qty 1) 6341(Qty 2)	9513	10
8	6341(Qty 1)	9511	4
9	6341(Qty 2)	9512	8
10	6341(Qty 3)	9513	12

	Pos #2			2MB	2MB		4MB	2MB	4MB
	Pos #3				2MB		4MB	4MB	4MB

Notes:

1. A 512KB storage card if used must be in position #1 (except when used with 1MB storage card).
2. See Specify Code #9510 or #9515 for these storage combinations.
3. A 1MB storage card if used must be in position #1.

Cache (#6400): Provides a means of reducing the effective access time of the disk, which can result in a substantial system level performance improvement (Model 30D, 31D, 60D, 61D, 60E and E70). The cache option does not require a feature position. Field Installation: No.

Specification Table: The table below is provided to determine if 4965 Storage and I/O Expansion Units or 4959 Input/Output Expansion Units are required to mount the desired features. Available feature positions within the processor unit are model-dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirement numbers cannot exceed zero. All features (#1XXX through #7XXX) may be field installed.

Note: Storage Addition Card (#6330) occupies a feature position.

Notes:

1. Must be contiguous I/O feature positions.
2. Must be contiguous I/O feature position with its associated controllers.

3. Not supported in the Stand-Alone Enclosure due to flat or internal cabling.
4. Supported in Stand-Alone Enclosure only with Stand-Alone Enclosure Cable (#4525).
5. Not available for Model K00.

MACHINES

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following Specification Table in M4959 pages.

MODEL CONVERSIONS

Model Upgrade 30MB Disk to 60MB Disk: All conversions may be field installed.

Any model upgrade that involves a disk storage capacity change requires replacement of the disk storage mechanism. Adequate provision must be made retaining the data contained on the replaced mechanism and elimination of user proprietary information.

The upgrade purchase prices for model conversions is greater than the purchase price differentials. The customer should carefully evaluate his future requirements when purchasing a system.

Replaced parts from any model conversion that includes a disk storage capacity change become the property of IBM.

Model Downgrades: (i.e. Model 60D to a Model 30D) are not recommended.

Model Upgrades: Model conversions are allowed for certain models of the 4956 processors. Consists of either replacing the 1MB backboard with a 2MB backboard, and/or replacing the existing processor card with a new performance processor card, and/or replacing basic storage with a 1MB storage card.

Possible IBM Series/1 4956 Model Upgrades:

FROM / TO	PRO- CESSOR	BACK BOARD	1MB	60MB DISK
4956-B00	E00	X	X	
	E10	X	X	
	B10		X	
4956-C00	C10		X	
4956-30D	60D			X
	E60	X	X	X
	E70	X	X	X
	31D		X	

4956-60D	E60	X	X	
	E70	X	X	X
	61D			X
4956-E00	E10			X
4956-E60	E70			X
4956-B00	K00	X	X	
4956-B10	K00	X	X	
4956-E00	K00	X	X	
4956-E10	K00	X	X	

Note: All models have multiple processor "X" designations. Example - B00/B0X, E60/E6X, etc.

Field installable: Customer price quotations and customer order acknowledgement letters for purchase model upgrades must state: "Installation of this model upgrade involves the removal of parts which become the property of IBM and must be returned to IBM." Model downgrades (i.e. Model E to Model B or Model 60E to Model 60D) are not recommended for field installation.

On any model upgrade that involves disk storage, adequate provision must be made to retain the data on the disk mechanism.

ACCESSORIES

Frame Stand (P/N 6841365): Provides an attractive, steel stand capable of supporting a 4956 Model C00, C10, 30D, 31D, 60D, 61D, E60 and E70. Enclosure (#4520) and a 4975 Printer. The stand rests on slides and comes in a pebble grey color only.

SUPPLIES

Diskette: The 4956 Model C00, C10, 30D, 31D, 60D, 61D, E60 and E70 uses the two-sided Diskette 2, Diskette 2D, or the one-sided Diskette 1. Diskette 1 is prepared in 128, 256, or 512 bytes per sector and must be re-initialized for other formats. Diskette 2 and 2D are prepared in 256, 512, or 1,024 bytes per sector. The 4956 Model C00, C10, 30D, 31D, 60D, 61D, E60 and E70 may be used to reformat the diskette. Single diskettes are packaged ten to a box. Minimum order is one box.

4956 PROCESSOR MDLS G10, H10, J00

PURPOSE

Provides arithmetic logic and control functions for Series/1.

MODELS

Model G G10: 1,024KB maximum, six I/O feature locations, full width unit, and a 40MB integrated disk (5-1/4 inch) with 400KB cache, 1.2MB diskette (5-1/4 inch). 1MB basic storage provided.

Model H H10: 2,048KB maximum, six I/O feature locations, full width unit, 1MB basic storage provided, 40MB integrated disk (5-1/4 inch), with 400KB cache and a 1.2MB diskette (5-1/4 inch).

Model J J00: 14MB maximum, seven I/O feature locations, full width unit, 2MB basic storage provided, 40MB Integrated Disk (5-1/4 inch), with 400KB Cache and a 1.2MB Diskette (5-1/4 inch).

All models are designed for mounting on support rails in a 4997 (see M4997 pages), an EIA standard 19-inch enclosure or in a stand-alone enclosure (#4521).

Notes:

1. Orders entered via WT AAS will use the three-digit code G10, H10 or J00
2. Channel repower (#1565) must be ordered when a 4959 I/O expansion unit or 4965 storage and I/O expansion unit is attached to a 4956 Processor (all models).

Limitations: All models support four integrated DASD devices only. As an example, one 5-1/4 inch diskette and three 5-1/4 inch disks maximum, or two 5-1/4 inch diskettes and two 5-1/4 inch disks.

HIGHLIGHTS

Model G10: Is a integrated package for the 4956 Series/1 processors. This package offers the same advantages as the 4956 Model B10 with 1,024KB of storage, plus a 40MB disk with a 400-kilobyte microprocessor controlled cache, 1.2-megabyte diskette and a universal power supply. Also, additional space is provided for a second 1.2-megabyte optional diskette and two additional optional 40-megabyte disks.

The internal performance of the processor is approximately twice that of the 4954. Basic model provides CPU, 1,024K bytes of error checking and correcting main storage, enclosure and power. Error checking and correcting (ECC) corrects all single-bit errors and detects double-bit errors, thus providing improved availability compared to a processor using parity checking. Includes storage address translation function (eight 64KB address spaces, eight 64KB I/O address spaces) and communication power. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart and eight general purpose registers per level. Byte-addressable storage includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Model H10: Is a integrated package for the 4956 Series/1 processors. This package offers the same advantages as the 4956 Model E10 with 1,024KB of basic storage (2,048KB maximum), plus a 40MB disk with a 400-kilobyte microprocessor controlled cache, 1.2-megabyte diskette and a universal power supply. Also, additional space is provided for a second 1.2-megabyte optional diskette and two additional optional 40-megabyte disks.

The internal performance of the processor is approximately 50% greater than that of the 4956 Model B10 (or 4956 Model G10). Basic

model provides CPU, 1,024K bytes of error checking and correcting main storage, enclosure and power. Error Checking and Correction (ECC) corrects all single-bit errors and detects double-bit errors, thus providing improved availability compared to a processor using parity checking. Includes storage address translation function (16 64K address spaces, 8 64KB I/O address spaces) and communication power. Additional 256KB, 512KB and 1MB storage increments are allowed to a 2MB maximum. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart, and eight general purpose registers per level. Byte addressable storage, includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Model J00: Is an integrated package for the 4956 Series/1 processor family. This new package offers the same advantages as the models G10 and H10 with a 1 MIP* internal performance. Provided with the standard package are 2048KB of basic storage, high speed floating point, 40MB disk, 1.2MB diskette, enclosure, 40MB microprocessor controlled cache, and universal power supply. Additional space is provided for a second 1.2MB diskette and two 40MB disks. Main storage is error checking and correction (ECC) that corrects all single bit errors and detects double bit errors, thus providing improved availability compared to a processor using parity checking. Includes storage address translation function (sixteen 64KB address spaces, 8 I/O address spaces), floating point and communication power. Maximum storage is 14Mb (2Mb directly addressable, 12Mb unmapped). The 4956 model J00 employs a seven word pre-fetch architecture. Models G10 and H10 employ a three word pre-fetch.

* The internal capability of the 4956 Processor Models J00 and K00 to perform at 1MIP does not represent thruput; actual performance is application dependent.

Storage: (Models G10 and H10) A 1,024KB storage card incorporating a new technology is now offered that will replace all current basic storage cards. Each storage card has ECC (Error Checking and Correction), which is capable of single-bit error correction and double-bit error detection, which offers an increase in ECC reliability.

The 4956 Model G10 has a basic and maximum storage of 1,024KB. The 4956 Model H10 offers a basic storage of 1,024KB with a maximum of 2,048KB by adding a second storage card (#6334).

Cache: (Models G10, H10 and J00) The 400-kilobyte disk cache is microprocessor controlled and has the potential to improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are prefetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improvements are application-dependent.

5-1/4 Inch Diskette Drive: (Models G10, H10 and J00) The diskette drive used within the Models G10 and H10 is a 1.2-megabyte 5-1/4 inch half-high diskette drive. The drive fits a standard half-high 5-1/4 inch form factor and provides interchange capability with current 96 track-per-inch diskettes formatted with 80 tracks for both reading and writing double-sided media. 48 TPI diskettes can be read, although interchangeability between the 96 TPI and 48 TPI drives is limited to writing diskettes in a 48 TPI drive and then reading those diskettes in a 96 TPI drive (i.e., the 96 TPI drive does not support writing 48 TPI diskettes to be read by 48 TPI drives).

Access time includes 3 milliseconds per track crossed plus 15 milliseconds for head settling. Diskette rotates at 360 RPM, yielding a data rate of 62,500 bytes per second and average latency of 83 milliseconds. The use of Flexible Diskette Storage provides signif-

icant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage.

5-1/4 Inch Disk Drive: (Models G10, H10 and J00) The disk drives used within the Models G10 and H10 are 40-megabyte (formatted) random direct access storage devices (DASD) that uses four fixed 5-1/4 inch disk platters as storage media. The drives contain read/write and control/servo electronics, a DC spindle motor, a track positioning actuator, an air filtration system, a sealed disk enclosure, and seven read/write heads. The disk drive features an industry standard ST506/ST412 interface, buffered seek, micro-processor control, closed loop actuator servo, rotary voice coil motor drive actuator, automatic actuator lock, dedicated head landing zone and a dynamic spindle brake.

The major specifications for the disk drive are:

- Data Transfer Rate - 0.625 megabytes per second
- Rotational Speed - 3600 RPM
- Average Latency - 8.33 milliseconds
- Single Cylinder Seek Time - 8 milliseconds (average)
- Average Seek (Weighted) - 40 milliseconds (maximum)

A high level of data integrity is maintained by Error Checking and Correcting (ECC) which contains sufficient information to calculate the location and magnitude of any burst error whose length is less than or equal to two bytes if only one burst occurs per sector. Burst length is defined as the distance between the first and last bit in error. In addition, the code will also detect any single-burst error of 17 bits and most burst errors greater than 17 bits. The track format of the disk, as implemented, allows for Error Correction Code (ECC) on the data fields and Cyclic Redundancy Check (CRC) on the ID fields.

Power Supply: (Models G10, H10 and J00) The power supply for the Models G10 and H10 is a new universal high frequency switching supply that is capable of handling input voltages from 100 to 240 VAC.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See "IBM Series/1 Customer Site Preparation", (GA34-0050), for details.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture. Specify codes (#2XXX, #8XXX and #9XXX) apply to plant orders only - do not use on MES orders.

Models G10, H10 and J00 use a single switching power supply that has a two position switch on the rear, 115 for low range 90 to 137 VAC and high range 230 for 180 to 259 VAC. The only requirement to change voltages is the correct switch position (115 for low range and 230 for the high range) and the proper line cord to match the wall receptacle. Models G10 and H10 may be incorporated with peripheral devices already installed or mounted in a 4997 Rack Enclosure with other machine types, therefore the voltage must be specified in order to be consistent.

- Power (AC, 1-phase): With 1.8m (6 ft) cord.

Industrial Automation Systems Specify

#9010 Plant Floor Systems: Collection or dissemination of data using plant floor terminals requiring human intervention, time and attendance, job reprint, etc., as well as automatically collected and disbursed data to and from programmable controllers, process controllers, etc. Also, includes power management systems.

Multiple Processors

- #92AA Number of Processors
- #93BB Sequence Number

For multiple processor configurations, specify #92AA where AA is the number of processors in the configuration, and #93BB where BB is the sequence number of this processor.

Note: In WTAAS, for processors which are part of a multiprocessor systems, use a suffix X as the low-order digit in the three digit WTAAS model code. For example, in a two-processor system using Model B processors, the first will be B10 and the second will be B1X. Use the multiple processor specify codes given above to define the number of processors and the sequence number for each processor in a multiprocessor system. Processors in a multiprocessor system need not be the same type or model. For complex multiple processor systems, contact the International Support Center in Boca Raton.

IPL Device

- #9148 Disk Primary IPL, Diskette Not IPL Device
- #9149 Disk Alternate IPL, Diskette Not IPL Device
- #9150 Diskette Primary IPL, Disk Not IPL Device
- #9151 Diskette Alternate IPL, Disk Not IPL Device
- #9152 Disk Primary IPL, Diskette Alternate
- #9153 Diskette Primary IPL, Disk Alternate
- #9144 No IPL

When diskette function is included in a Series/1 configuration, IPL from such a device is required for loading diagnostics.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the "Specification Table." To simplify, shorten and improve the usability of these pages, the description of all those features which are available in all processors, the 4965 Storage and I/O Expansion Unit and the 4959 Input/Output Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for 4959 Input/Output Expansion Unit and 4965 Storage and I/O Expansion

Do not reproduce without written permission

Unit. Required for 4959 and 4965 connected to 4956 Models G10, H10 and J00. Field Installation: Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line, as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed showing status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Line. Mounts under front cover of the processor. Does not require a feature position.

Floating Point (#3925): Provides floating point instruction set for the Model G10. Includes single (32-bit) and double (64-bit) precision arithmetic plus conversion between binary and floating point data. Does not require a feature position. Maximum: One. Field Installation: Yes.

Floating Point (#3926): Provides floating point instruction set for the Model H10. Includes single (32-bit) and double (64-bit) precision arithmetic plus conversion between binary and floating point data. Does not require a feature position. Maximum: One. Field Installation: Yes.

Second Diskette Drive (#4110): Provides for a second 5-1/4 inch diskette drive on the Models G10, H10 and J00. Does not require a feature position. Field Installation: Yes.

Second Disk Drive (#4115): Provides for a second 40MB disk drive within either a Model G10, H10 and J00. Does not require a feature position. Field Installation: Yes.

Third Disk Drive (#4116): Provides for a third 40MB disk drive within either a Model G10, H10 or a Model J00. The cables and connectors are different between the second and third disk drive. Does not require a feature position. Field Installation: Yes.

Stand-Alone Enclosure (#4521): For the 4956 Models G10, H10 and J00. Consists of a three-sided wraparound cover with decorative, removable front and rear covers. Field Installation: Yes.

Programmer Console (#5655): Provides data entry/data display console. Added function includes display/store into I/O segmentation registers and console lock. Includes hexadecimal key pad and display lights, ability to stop on error or on address. In addition to basic console provided with base processor. Does not require a feature position. Field Installation: Yes.

Nomenclature:

English US	#0150	Italian	#0132
French	#0128	Japanese	
German	#0129	Katakana	#0126
		Spanish	#0131

Storage Addition Card - 1MB (#6334): Provides additional processor main storage in one 1,048,576-byte increment for Model H10 only. Requires one feature position. Limitations: Total processor main storage in Model H10 cannot exceed 2,048KB (two 1MB cards). Field/Factory Installation: Yes.

Storage Addition Card - 2Mb (#6340): Provides additional processor main storage in one 2048Kb increment for Model K00 only.

Storage Addition Card - 4Mb (#6341): Provides additional processor main storage in one 4096 increment for Model K00 only.

Orders for additional storage card features #6340 and #6341 must include a Specify Code to reflect the correct storage card quantity that will be installed as a result of the order. A specify code is required so that the proper set of cross-over connectors will be supplied with the order. Only one specify code is required for the installation or removal of storage card features #6340 or #6341. Orders with multiple specify codes will be rejected. Remove/Re-install RPQs are available. The correct set of storage card connectors will be sent with the RPQ instructions. It is necessary to know what ultimate configuration is required. The correct specify code will cause the correct set of connectors to be delivered. When a card is removed a specify code must also be removed and a new specify code assigned if a feature card(s) remains. Branch Administration should remove the specify code prior to adding the new specify code when storage card features are added or removed. Factory orders for processors that contain no additional storage features do not require a specify code.

Config. Number	Additional Storage	Required Specify Code	Total Additional Storage (MB)
1	None	None	0
2	6340(Qty 1)	9511	2
3	6340(Qty 2)	9512	4
4	6340(Qty 3)	9513	6
5	6340(Qty 1) 6341(Qty 1)	9512	6
6	6340(Qty 2) 6341(Qty 1)	9513	8
7	6340(Qty 1) 6341(Qty 2)	9513	10
8	6341(Qty 1)	9511	4
9	6341(Qty 2)	9512	8
10	6341(Qty 3)	9513	12

Notes:

- Total processor main storage in the Model G10 is the basic storage supplied 1,024KB.
- A 1MB storage card if used must be in position #1.
- Model J00 has a basic and maximum storage of 2,048 bytes located on the processor card.

Specification Table: The table below is provided to determine if 4965 Storage and Expansion Units or 4959 Input/Output Expansion Units are required to mount the desired features. Available feature positions within the processor unit are model-dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirement numbers cannot exceed zero. All features (#1XXX through #7XXX) may be field installed.

Notes:

1. Must be contiguous I/O feature positions.
2. Must be contiguous I/O feature position with its associated controllers.
3. Not supported in the Stand-Alone Enclosure due to flat or internal cabling.
4. Not available for Model J00.

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following Specification Table in M4959 pages.

MODEL CONVERSIONS

Model Upgrade	New Blackboard	New Processor	Remove Storage
G10 to			

MACHINES

H10	Yes	Yes	No
G10 to			
J00	Yes	Yes	Yes
H10 to			
J00	Yes	Yes	Yes

The upgrade purchase price for model conversion is greater than the purchase price differentials. The customer should carefully evaluate future requirements when purchasing a system.

ACCESSORIES

Frame Stand (P/N 6841365): Provides an attractive, steel stand capable of supporting a 4956 Model G10, H10 or J00 within Stand-Alone Enclosure (#4521) and a 4975 printer. The stand rests on glides and comes in a pebble gray color only.

SUPPLIES

Diskette: The Models G10, H10 and J00 use the two-sided 5-1/4 inch diskette, ANSI compatible, soft sector with high coercivity. IBM Part Number 6295022, 96 tracks per inch.

Model conversions are allowed. Consists of replacing the backboard and the existing processor with a new backboard and new processor. Upgrades to Model J00 require the storage to be removed also. The storage cards removed are the property of the customer. The removed backboard and removed processor become the property of IBM and must be returned to IBM. Field Installation: Yes. Customer price quotations and customer order acknowledgement letters for purchase model upgrades must state: "Installation of this model upgrade involves the removal of parts which become the property of IBM." Model downgrades are not recommended.
